CAPACITANCE

Nominal capacitance expressed in picofarads (uF) by three-digit number, first two digits represent significant figures, last digit specifies number of zeroes to follow. When the nominal value is less than 10 pF, the letter 'R' indicates the decimal point and the succeeding digit(s) represent significant figure(s). For example: IRO indicates 1.0 pF; R75 indicates 0.75 pF and OR5 indicates 0.5 pF.

FAILURE RATE LEVEL

M = 1.0%
P = 0.1%
R = 0.01%
S = 0.001%
Expressed in % per 1000 hours

CAPACITANCE TOLERANCE

C = ±.25 pF
D = ±.5 pF
F = ±1%
G = ±2%
J = ±5%
K = ±10%

NEC SUPERCAP—DOUBLE LAYER CAPACITORS

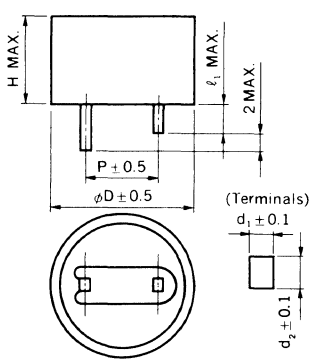
Shown Actual Size

The expanding use of digital processing with its associated memory is driving the need for a standby power source to maintain the contents of volatile memories or to continue processing function during AC power outages. Historically, this standby function has been a choice between primary or secondary batteries.

The use of nonrechargeable (primary) batteries, such as Lithium, may be risky since there is no way to determine how much charge is still available to handle a power outage of unknown duration. Rechargeable batteries, such as Ni-Cd, may exhibit discharge memory, must have a controlled charge rate to limit current to battery, and must be periodically replaced.

More recently, the use of CMOS and other low power drain technologies in processor and memory IC's has drastically reduced the total standby power requirements. This coupled with the fact that most power outages last only a short period of time (order of several hours) has opened the door for the **SUPERCAP** as a third alternative standby power source.

SUPERCAP is a completely innovative type of capacitor providing a volumetric efficiency (capacitance per unit volume of a given voltage) of 10 to 50 times that of conventional aluminum electrolytic capacitors. The high capacitance (1 000 000 microfarads) and low leakage current makes the **SUPERCAP** an efficient, reliable, and cost effective energy storage device. **SUPERCAP** can be used as standby power sources for CMOS memories and microcomputers up to several weeks during power outages.



The **SUPERCAP** can be assembled on printed circuit boards by conventional soldering processes together with all other components. The **SUPERCAP** can be charged and discharged at both high and low current rates; i.e., microamps to amps.

NWL ... the Source for Custom

A sampling of our diversified size and case capability.

NWL Capacitors . . .
Dedicated entirely to the design, production and marketing of high voltage custom oil-filled capacitors for the industrial community, NWL Capacitors has two facilities to serve your capacitor needs. Snow Hill, North Carolina, our newest facility and Riviera Beach, Florida. Either location you have the assurance of quality when you do business with NWL Capacitors because we are a division of NWL Transformers. In business for over 60 years, NWL employs over 300 people with an excellent reputation for manufacturing transformers, power supplies, reactors, chokes, and electronic controls.

Engineering Excellence

NWL's engineering staff has over 60 years of cumulative engineering experience in the design and manufacture of industrial capacitors.

This experience tells us that for most applications a properly specified custom capacitor will perform better and provide long term cost savings when compared to "stock units".

Our engineers analyze every request and custom build each order to the customer's exact requirements.

Efficient computer-based design techniques plus a large and varied raw materials inventory, allows NWL to design capacitors specifically for your requirements, and deliver quickly.

Modern Equipment

NWL's production equipment is built to exacting specifications to support our engineer's design techniques. Multiple vacuum chambers allow all capacitors to be both dried and impregnated without being moved. We consistently achieve vacuum levels of less than 10 microns.

These techniques result in capacitors with superior mechanical form and higher corona inceptive voltages. All this means a longer, safer operating life.

Quality . . . Quality Assurance

Quality assurance personnel test each and every production capacitor according to customer requirements. This assures consistent high quality in every product shipped to the field.

All capacitors are 100% tested by a quality control inspector before shipping.

Quick Delivery

NWL's deliveries are the best in the industry because:

- We maintain large inventories of foil and film in a wide variety of widths and thicknesses.
- Our custom-built high capacity film slitting machines means any film width we need is immediately available. Thus, our capacitor deliveries are not controlled by the lead times of our film suppliers.
- Sophisticated computer-based production control and material planning systems let us quickly and effectively review and adjust our schedules to meet customer requirements.

One of many winding machines that accept a wide variety of materials.

eem MINIGLOSSARY CAPACITORS

Anode: One of two plates or conductors. In polarized capacitors, the anode should be connected to the positive conductor in the circuit.

Capacitive Reactance: The opposition (in ohms) of capacitance to the flow of alternating current, equal to the reciprocal of the product of the angular frequency (2π times frequency in Hertz) of the current times the capacitance in farads.

Cathode: One of two plates or conductors. In electrostatic capacitors the cathode is metallic. In electrolytic capacitors the cathode is a liquid, gel or other conductive material which is in intimate contact with a metallic cathodic connection.

Dielectric Constant: The ratio of the capacitance of a capacitor with some material other than air between the capacitor plates to the capacitance of the same capacitor with air between the plates. For example, the dielectric constants of air, Teflon®, polystyrene and ruby mica are 1, 2.1, 2.6 and 5.4, respectively.

Electrolytic: A capacitor with one metallic conductor (generally the anode) and with a liquid or semiconductor cathode. Nonpolarized electrolytic capacitors generally have two equal anodes as well as the liquid cathode. These anodes operate alternately as anode and cathodic connection as alternating current is applied.

Electrostatic: One of two general classes of capacitors in which two or more discrete metallic conductors are present and separated by an insulating dielectric material. Examples include: mica, ceramic, film, and paper types.

Farad: The basic unit of measure in capacitors. A capacitor charged to one volt with a charge of one coulomb (one ampere flowing for one second) has a capacitance of one farad. Capacitors are generally rated at portions of a farad (microfarads or picofarads).

1 farad (F) = 1,000,000 microfarads (μF) 1 microfarad (μF) = 1,000,000 picofarads (pF)

Impedance: All capacitors exhibit impedance. It is a function of capacitor type and internal construction. This can be particularly important in certain applications such as filters for switching power supplies. Capacitors used in these applications often have special multiple tab construction to shorten current paths and to reduce internal resistance.

Leakage Current: Expressed as dcl for electrolytic capacitors, a measure of the intrinsic losses in a charged capacitor. Generally speaking, the lower the dcl, the higher quality the capacitor.

Power Factor: A measure of the overall efficiency of a capacitor. Power factor ratings take all internal losses into consideration in a complex formula. This parameter of certain capacitors is often very important in AC applications such as motor-start and/or motor-run capacitors

Rated Voltage: The rated working voltage of a capacitor. Generally expressed in DC Volts (Vdcw). This is the voltage at which a capacitor may be safely operated at 25°C continuously within its overall parameters.

Ripple Current: The total amount of alternating and direct current that may be applied to an electrolytic capacitor under stated conditions. In general, the higher the ripple current applied, the shorter the operating life of the capacitor will be. Application of significantly higher than rated ripple currents can shorten the capacitor life dramatically and may even cause catastrophic failure (explosion).

Surge Voltage: The momentary surge voltage which may be applied for a stated length of time without doing permanent damage to the unit.

Temperature: Capacitors are generally rated at 25°C at sea level under specific humidity conditions. Operating temperature ranges are also given, along with derating (reliability) curves for operation at temperatures other than 25°C.

Temperature Coefficient: Expressed as TC in ppm (parts per million) or in percent (%) from the norm of 25°C. This is seldom a straight line and may vary widely for certain types. Most capacitors have positive TC in that the capacitance increases as temperature increases. Some types, however, have negative TC in that the capacitance decreases as temperature increases.

PEC 831 Metallized Polyester Film

General Characteristics

The PEC 831 is manufactured using a unique packaging process which allows the production of a compact body size for a given capacitance. This allows the designer to specify an automatically insertable, axial lead capacitor allowing higher circuit board densities than were previously possible. The general characteristics of the PEC 831 make it an ideal choice for general coupling, decoupling and filtering applications. All PPD capacitors are made in the U.S. and are available taped and reeled for automatic insertion.

PPC 830 Polypropylene Film/Foil

General Characteristics.

The PPC 830 is an axial lead, polypropylene film capacitor that features small size, low price and flame retardant coating. The electrical stability of polypropylene and its characteristic high resistance to moisture allow these units to retain their original capacitance over long periods of time without degradation due to changing environmental conditions. The PPC 830 has the excellent characteristics previously found only in polystyrene capacitors but offers a higher temperature rating and, of course, flame resistance. The low negative TC and very low dissipation factor of the PPC 830 provide for a stable frequency response curve and high Q in resonant and filtering circuit applications. Since the PPC 830 also exhibits high insulation resistance (I.R.) and low dielectric absorption (D.A.), it is a good choice for storage and timing circuit applications. All PPD capacitors are made in the U.S. and are available taped and reeled for automatic insertion.

PPC 831 Metallized Polypropylene Film

General Characteristics

The PPC 831 is an axial lead, metallized polypropylene film capacitor featuring small size, high performance, low price and conformal encapsulation with a flame retardant coating.

The physical and electrical characteristics of polypropylene as a dielectric are commendable. Polypropylene is relatively impervious to moisture. It is also extremely stable. The PPC 831 will, therefore, retain its original properties over extended periods of time in a fluctuating environment.

Other noteworthy attributes of the PPC 831 are high insulation resistance (IR) and a low dielectric absorption (DA) factor. Both of these parameters are of critical importance in the selection of a sample-and-hold capacitor in data acquisition applications. The DA of polypropylene is about 10 times less than that of polyester and is significantly less than that of polycarbonate or polystyrene.

Also to be considered are the gently sloping curves for temperature coefficient (TC), dissipation factor (DF) and capacitance variation with frequency. The relatively flat response of the PPC 831 assures dependable, stable performance when incorporated into critical resonant and filtering circuit applications.

The "A" and "B" case sizes of the PPC 831 and PEC 831 style capacitors are computer designed with today's manufacturing and design criteria firmly in mind — namely, automation.

Until now, the most useful configuration for automated assembly, with respect to general bypassing, filtering and timing requirements, has been the box style capacitor. This is because the corresponding axial style devices are of physical proportions incompatible with automatic insertion equipment. Unfortunately, the box capacitor presents the modern factory with its own unique problems. An expensive radial insertion machine must be obtained. Box insertion requires an additional step in the assembly process which adds both direct and indirect production costs. In comparison, axials insert 3 times faster than radials.

PPD has been studying this situation for some time now. The culmination of this work has been the development of the "A" and "B" case film capacitors. The designer is now presented with the capability of specifying axial lead, automatically insertable, metallized film capacitors in the range of .001 μF to .27 μF. Examination of the dimensions of the "A" and "B" cases will reveal that, in length, they closely approximate the dimensions of RN55 and RN60 style resistors. Both "A" and "B" cases have a .177" ± .020" diameter. They can, therefore, be taped on 0.2" centers. Ultimately, these devices can be sequenced on standard axial lead insertion machinery to provide high volume, low cost production.

SUPER TIME SAVER!

Do you work with ICs? Do you have trouble finding the IC you need? Are you sick and tired of sifting through dozens of manufacturers' data books? Do you have trouble comparing one set of specs to another? Are you sick and tired of wasting time?

Do we have good news for you! Get your hands on the latest annual copy of the IC Master. The Master will save you both time and money. Here's how.

The Master lists every single IC you can buy. Better yet, the Master lists ICs by function. You know what you want to do. The Master tells you who makes what for what you want to do.

There's more! The Master lists every known alternate source to every integrated circuit. If somebody makes a substitute for an IC, the Master tells you. And fast!

Want to find a custom or semicustom IC? The Master tells you who the manufacturers are, what their capabilities are, and what design tools you need.

Looking for a distributor or a local sales office? The Master tells you where they are. Got a technical problem? The Master tells you who to call. Can't figure out a part number? The Master tells you how the part number systems work.

There's more! The Master has a section on microprocessor development tools with complete performance parameters. There's another section on programmable logic devices giving you everything from output configuration to PLD development systems.

Want to know if there's an application note available on a given part? The Master tells you!

If your question has anything to do with integrated circuits, you need the IC Master. Subscribe now by calling (516) 227-1314. Ask for Marie Botta. Tell Marie you need the Master now.

If you prefer, write to Marie, Hearst Business Communications, 645 Stewart Ave., Garden City, NY 11530. She'll mail you the IC Master subscription form right away.

And, if you tell her you saw it in the 1991/92 EEM, she'll take $10 off the subscription price!

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage of 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 30,000 megohms-microfarads, but need not exceed 30,000 megohms.

DISSIPATION FACTOR

Shall not exceed 1.0% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE

Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz, ±20 Hz.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.3% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 85°C, and room to −55°C. The mathemtaical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287, Para. 3.12 when tested in accordance with Mil-STD-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

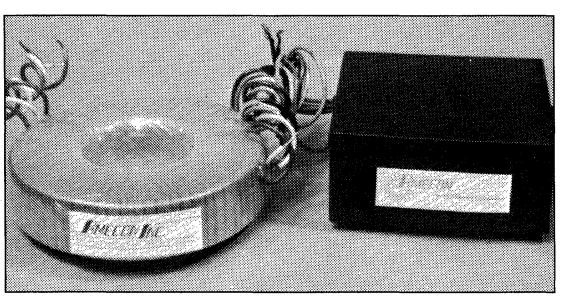
"Snap-On" 5-50A Load Detector

The LD-50 is ±3% accurate from 5A to 50A and can handle short-term currents up to 150A! It costs a fraction of sensors with comparable range and accuracy *and* it's designed for pc-mounting and auto-insertion. And the LD-50 features a revolutionary snap-on design that simplifies installation – even in pre-wired systems!



Toroidal Current Transformers

A complete line of CTs for current sensing, measurement and detection in controls and automation. For current-to-voltage and current-to-current applications. Amecon CTs are smaller, lighter and more compact. Three families are available: low profile/high accuracy; standard size/high accuracy; standard size/normal accuracy.

Switch Mode Power Supply Transformers and Inductors

Current sense transformers, inverter transformers and filter inductors. A large selection of sizes are available, including miniature and low profile; in open winding, encapsulated and semi-encapsulated configurations. Custom designs to 200A. High frequency inverter transformers for power transistors and MOSFETs with power levels from 10VA to 1.0kVA covering frequencies from 5 to 100kHz with low power losses.

Toroidal Power Transformers

Low-noise, high efficiency power transformers are available with ratings from 10VA to 10kVA. In custom configurations and off-the-shelf models.

Reduction of inductance due to DC current can be taken from tables. To find additional inductance change for operating levels and frequency other than listed in tables, solve for X using formula given above.

Use V_{OP} = Actual operating level (RMS)
V_{TEST} = RMS test level indicated at 10KHz
f_{OP} = Actual operating frequency
Refer to corresponding graph to determine inductance change in %.

SHIELDED SUBMINIATURE ADJUSTABLE RF COILS

Dimensions: 1/2" sq., × 5/8" high.

These compact adjustable coils offer a minimum two-to-one inductance range with relatively small changes in Q. The tuning adjustment is accessible from either the top or bottom of the coil assembly. Magnetic shielding is achieved through the use of cup cores while the metal shield offers effective electrostatic shielding. Printed circuit terminals on base and shield.

TESTING

Specifications and test methods can be a morass of contention between Manufacturers and Users of chip inductors, unless specifics are resolved prior to arrival at incoming inspection.
Testing procedure's vary from Manufacturer to Manufacturer. The most popular testing equipment is the HP4342A Q-meter, HP4191A Impedance Analyzer and the HP4192A Impedance Analyzer. None of these meters can be relied upon for an absolute reading so the use of correlation standards becomes a must in setting specifications.

Using the proper test fixture is also essential to correlation between 2 pieces of test equipment. This area does not have an established standard yet. Some Manufacturers use test probes, some use spring clip test fixtures and none of them contribute minimal inductance to the test equipment terminals.

The need to understand the Manufacturer's testing methods prior to selecting chip inductors for your application is important and can eliminate a lot of misunderstanding and confusion at incoming inspection.

3. Incremental current (INCR I) is the minimum current at which the inductance will be decreased by 5% from its initial (zero — DC) value.
4. Dielectric Withstanding Voltage — 1000 VRMS.
5. Operating Temperature Range — −55°C to +85°C.
6. Materials:
   Coil Form — Ferrite.

HIGH CURRENT CHOKES

FOR SWITCHING REGULATORS AND POWER FILTERS **7230**

TYPE 7230 10 μH-10 mH 10% Tolerance
Recommended Mounting Pitch—1.35"

NOTES:

1. Inductance measured on Cambridge Technology type 520 L/C Meter at 1 KHz.
2. The current rating (Rated IDC) is based on 0.75 watt power dissipation (I^2R) for an approximate 20°C temperature rise. Depending on the application, these units may be operated at higher currents.
   The core material for the 7230 series has been chosen for optimum current handling capability. Because this material has a relatively low volume resistivity, the core will appear as a shunt resistance on the order of 1 Kilohm, which may have to be taken into account when determining total power dissipation; e.g., if the induced voltage across the coil is 10 volts, there will be a V^2/R loss on the order of 0.10 watt, in addition to the I^2R losses associated with the winding.
3. The incremental current (INCR I) is the approximate current at which the inductance will be decreased by 5% from its initial (zero-DC) value because of saturation. If the current is increased beyond INCR I, the inductance will continue to decrease as shown by the saturation curve below.
4. Dielectric Withstanding Voltage: 1000 VRMS.
5. Operating Temperature Range: −55° to +105°C.
6. Marking: Printed with Caddell-Burns Part Number.
7. Materials:

   Coil Form: Ferrite
   Magnet Wire: Per FED SPEC J-W-001177/9
   Jacket: Flame Retardant PVC shrink tube UL Type FR-1 per MIL-I-23053

MINIATURE HIGH CURRENT CHOKES

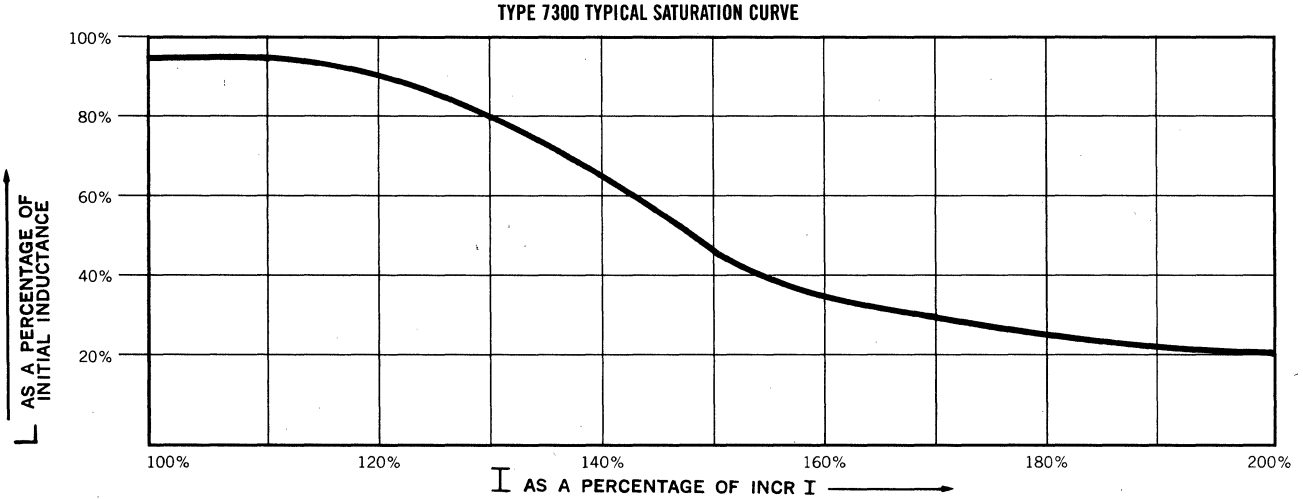
FOR SWITCHING REGULATORS AND POWER FILTERS **7300**

TYPE 7300 10µH–10mH 10% Tolerance
Recommended Mounting Pitch–.80"

NOTES:



1. Inductance measured on Cambridge Technology type 520 L/C Meter at 1 KHz.
2. The current rating (Rated IDC) is based on 0.25 watt power dissipation (I^2R) for an approximate 20°C temperature rise. Depending on the application, these units may be operated at higher currents.
   The core material for the 7300 series has been chosen for optimum current handling capability. Because this material has a relatively low volume resistivity, the core will appear as a shunt resistance on the order of 1 Kilohm, which may have to be taken into account when determining total power dissipation; e.g., if the induced voltage (2π fLI) across the coil is 10 volts, there will be a V^2/R loss on the order of 0.10 watt, in addition to the I^2R losses associated with the winding. This is not usually a factor unless the choke is operated at high levels of R.F. excitation.
3. The incremental current (INCR I) is the approximate current at which the inductance will be decreased by 5% from its initial (zero-DC) value because of saturation. If the current is increased beyond INCR I, the inductance will continue to decrease as shown by the saturation curve below.
4. Dielectric Withstanding Voltage: 1000 VRMS.
5. Operating Temperature Range: –55° to +105°C.
6. Marking: Printed with Caddell-Burns Part Number.
7. Materials:
   Coil Form: Ferrite
   Magnet Wire: Per FED SPEC J-W 001177/9
   Jacket: Flame Retardant PVC shrink tube UL Type FR-1 per MIL-I-23053.

"SLOT 10" 10mm TUNEABLE RF COILS

These veratile Coilcraft variable inductors operate over a wide range of frequencies. Standard inductance values are available from less than 1 μH to over 1 mH. Custom values can also be provided upon request.

Coilcraft "Slot Ten" RF coils come in an international 10mm package. Their precision-molded slotted bobbins assure tight tolerances and high stability.

A variety of magnetic and electrostatic shielding options are offered. "Slot Ten" coils are tuned by means of ferrite or powdered iron tuning cores with a hex hole for easy, positive adjustment.

Coilcraft **Designer's Kit M100** contains 18 shielded and 18 unshielded coils (3 each) plus extra cores and sleeves to create all of the standard values shown. To order, please contact Coilcraft.

SELECTION GUIDE

Coilcraft "Slot Ten" coils come in five different styles. Consult this table for the inductance range, relative Q, and shielding options of each style. Then use the appropriate specification chart to pick a specific part number.

Style	L (μH)	Electrostatic Shield	Magnetic Shield	Recommended Frequency	Tuning Core	Relative Q	Relative Cost
Style 1	.8 — 624	No	No	Higher	Iron	Hi	Low
Style 2	.8 — 927	No	No	Higher	Ferrite	Hi	Low
Style 3	.7 — 450	Yes	No	Higher	Iron	Low	Med
Style 4	.8 — 624	Yes	Yes (Iron)	Lower	Iron	Med	Hi
Style 5	.9 — 1143	Yes	Yes (Ferrite)	Lower	Ferrite	Med	Hi

1 All readings taken on H.P. 4342-A Q Meter.
2 L min is achieved at maximum extension of the core toward PC board. Complete tuning range is reached within the boundaries of the coil form.
3 All specifications are recommended at standard "Q" meter frequency as a simple way to assure the quality of our parts. L and Q readings will vary with frequency change.
4 Unshielded parts are coated with lacquer to protect the winding.
5 Shielded parts have a sleeve insert to protect the winding.

MOLDED RF COILS—SHIELDED
Coils are electromagnetically shielded with inductance values of 1μH through 10,000μH. Inductance Tolerances of ±5% are available by special request. Shielded coils reduce magnetic coupling between components and should be used only where coupling problems exist, since cost is normally higher.

LCR SERIES RF COILS
a unique series of inductors designed for overseas manufacturers who wish to eliminate problems when correlating inductance values of coils manufactured to Q-Meter specifications (according to U.S. military requirements) when they are measured on an HP impedance analyzer or LCR meter. Equivalent Domestic Use Part Numbers include: Series No. 1025, 1026, 1537, 1840, & 2500.

SURFACE MOUNT INDUCTORS

Coils are available in unshielded designs with inductance values ranging from .010μH thru 1,000 μH ± 10%. Shielded versions to reduce magnetic coupling between components are available from .010μH to 560 μH ± 10%. Closer inductance tolerances are available on special order.

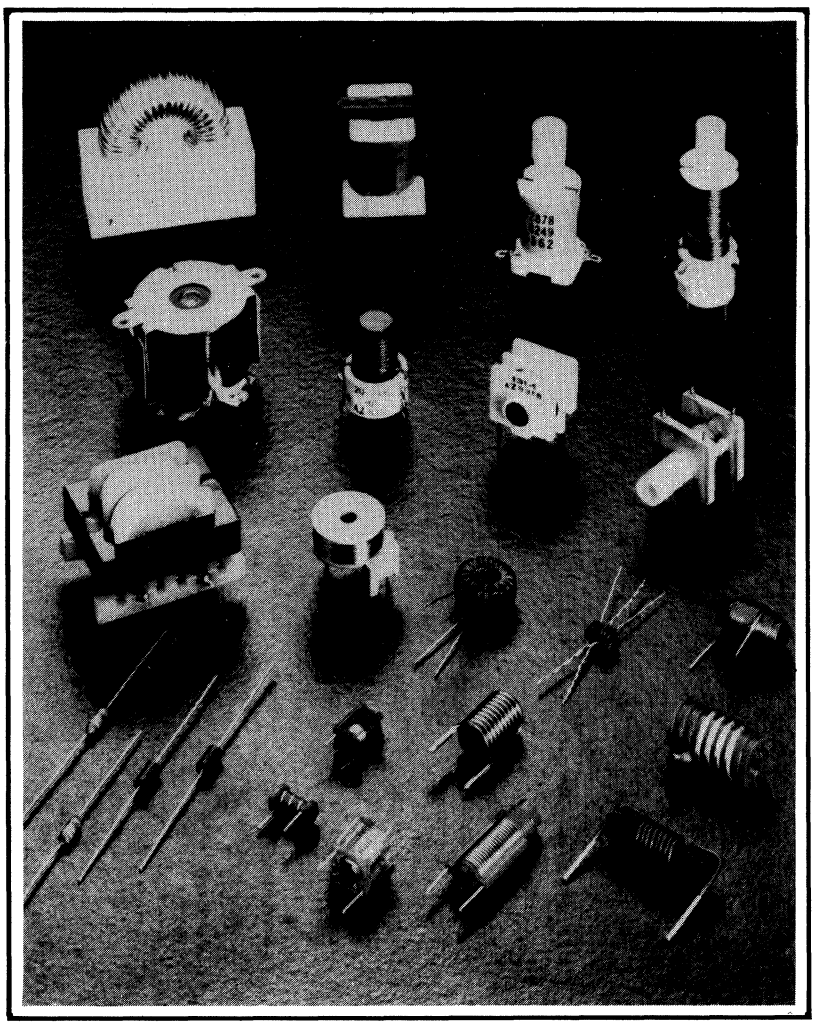
Their rectangular outline package with symmetrical orientation is ideal for automatic indexing and assembly methods. Their parallel flat surfaces are well adapted to all methods of vacuum pickup and indexing. Coils can be supplied in bulk or reel tape.

Delevan/SMD components are compatible with all state-of-the-art attachments and soldering methods. Standard metalized ends are solder coated copper.

They are molded in thermally stable flame retardant epoxy resin. High temperature solder is used for internal joints to insure maximum reliability during assembly and attachment operations.

Our inductors are made in accordance with the basic requirements of MIL-C-83446.

Many of the electrical parameters for new or prototype products have been calculated and are to be used for reference only. Please consult our current catalog or contact our factory when critical design data are required.



SMD Inductors are covered by
U.S. Patent Nos. 4,801,912; 4,914,804 and 4,934,048

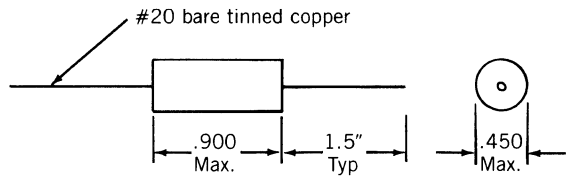
POWER CHOKES
PL SERIES

HIGH CURRENT CHOKES PL SERIES

Inductance: Measured on general radio 1657 LRC bridge at 1 kHz.

Current (rated IDC): Based on 0.5 watt power dissipation for approximately 20°C temperature rise. Depending on the application, these units may be operated at up to twice the rated current.

Incremental Current (INCR I): The minimum current at which the inductance will be decreased by 5% from its initial (zero DC) value.



Dielectric Withstanding Voltage: 1000 VRMS

Operating Temperature Range: – 55°C to 105°C

Materials: Coil form — ferrite
Cover — flame retardant heat-shrink tubing
Magnet wire — per MIL-W-583 Type B

Marking: Printed with part number.

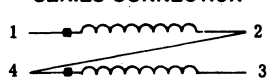
PICO's POWER INDUCTORS



FOR MULTIPLE OUTPUT REGULATORS WE CAN SUPPLY ALL NECESSARY INDUCTANCE VALUES ON ONE CORE This technique provides minimum possible size and gives excellent dynamic and DC cross-regulation . . . Contact factory for these special inductors.

- **Handle large transient DC currents**
- **Minimum possible size**
- **Manufactured to MIL-T-27 (TF5S04ZZ)**
- **Special high frequency core material to insure low losses**
- **All units have split windings**
- **Large selection of sizes available**
- **All units are magnetically shielded**

All inductors have split windings (except size AA)— ratings shown in table are for series connection. Parallel connection will have ¼ inductance at twice the DC current and ¼ the DC resistance, ie. parallel connection of PICO-69010 will have 32.5 microhenry with DC resistance of .015 Ohms at 6 Amps DC current (10% drop in L)

Common EMI Mode Suppression Inductors

- **Minimum possible size**
- **130°C operation (Ambient + Temp. Rise)**
- **Windings Balance ± 1%**
- **Dielectric Strength .... 1500 Volts RMS**
- **All units are magnetically shielded**

These Inductors are well suited for use in Switching Regulators, DC to DC Power Supplies and all types of Electrical Equipment where the elimination of line transmitted Electromagnetic Interference is important. Electrical equipment will generate noise due to switching operations of transistors, SCR's, relays, triacs, etc. By using these Inductors, noise being fed back to the power line is minimized to an acceptable level and this noise will not interfere with other equipment operating on the same power line.

ALL INDUCTORS ARE MEASURED AT 0 DC. THE MAXIMUM DC LISTINGS ARE FOR APPROXIMATELY 5% DROP IN INDUCTANCE AND NEGLIGIBLE HEAT RISE. THE CHANGE OF INDUCTANCE WITH AC OR DC CURRENTS IS ILLUSTRATED BY THE CURVES SHOWN FOR EACH INDUCTOR TYPE. THE EXCITATION IS PLOTTED IN mA X $\sqrt{mHy}$. FOR EXAMPLE THE 10 mH INDUCTOR (64314) WITH 79 mA DC FLOWING WILL HAVE AN EXCITATION OF mA X $\sqrt{mH}$ = 79 X $\sqrt{10}$ = 250 AND THE INDUCTANCE WILL DROP FROM 10 mH TO 9mH. IF THE 79 mA WAS AC THE INDUCTANCE WOULD BE 9.65 mH.

PICONICS

Micro Inductor Products and Application

The principal application for Piconics' Inductors has traditionally been in linear hybrid amplifier, micro-strip and stripline circuits. These designs have been used in a wide range of systems from the Space Shuttle Program to commercial microwave applications. Major use is in military systems where excellence and tight quality controls are required.

Piconics' components feature excellent stability, high Q and controlled characteristics. They are packaged in various configurations with a wide range of lead materials. Internal connections are welded to avoid the problems associated with high temperature soldering. Encapsulation is mechanically interlocked to strengthen all surface (shear) bonds. The materials and methods used at Piconics are compatible with normal requirements in hybrid circuit manufacturing.

Piconics' custom design capability has led to the development of unique products. Should your inductor requirements be outside the parameters of our standard listings, contact Piconics directly for a prompt quotation to your needs.

PICONICS

SP SERIES/M/MG SERIES MC SERIES

SP Series Spiral Chip Inductor

This style inductor may be used where low inductance values are required and gold wire bonding is the method for making interconnections. When used as an r.f. choke, attach center pad to r.f. and outside pad to power supply. Custom designs available. Other ceramic materials having various dielectric constants are available.

DIMENSIONS IN INCHES

NOTES:

(1) Self-resonant frequency may be increased by mounting inductor on an insulating stand-off. These Stand-offs can be provided by Piconics.
(2) Inductors to 25 turns in this geometry are available on special order.
(3) Attachment is generally made using non-conductive epoxy such as EPO-TEK H-61 or EPO-TEK H-20.
(4) Thermosonic wire bonding using 1 mil gold wire is recommended for lead attachment to this style inductor. Gold ribbon may also be used.
(5) Resonances shown in the tables are the lowest self resonances encountered. Typical values are higher.
(6) Measurements are very dependent on fixturing and frequency.
(7) Quartz typically gives higher SRF and Q's than ceramic due to lower Dielectric Constant.
(8) Bonding area typically .005" in diameter.
(9) Other thicknesses, values, sizes available on request.

Microwave Components — M/MG Series

Piconics' M series is a miniature broadband air core choke with a high self-resonant frequency, suitable for microwave applications.

Piconics' M series chokes provide inductance values from 6.3nH to 684nH, operating frequencies from 100 MHz, and self-resonant frequencies from 1 GHz to 28GHz.

Constructed of 47 AWG insulated copper wire rated at 130°C. Piconics' M series chokes are available from 2 to 100 turns for standard models. Special models can also be provided.

Applications include oscillators, mixers, switches, stripline devices, broadband modulators, power supplies, filters and frequency multipliers.

Swingductor™ RL1386 /RL1518

(unmounted) (mounted, shown)

185 values each version

Designed for applications requiring a known inductance change with changing current loads (as in power supplies). Although similar in appearance to conventional toroids, the special core material allows a "controlled saturation," so that a specific inductance value is repeatable at a specific current. The core material is effective up to 1 MHz. As a result of toroidal design, the Swingductor™ produces a closed magnetic field, resulting in low EMI. All are supplied with pretinned leads for easy PC board installation.

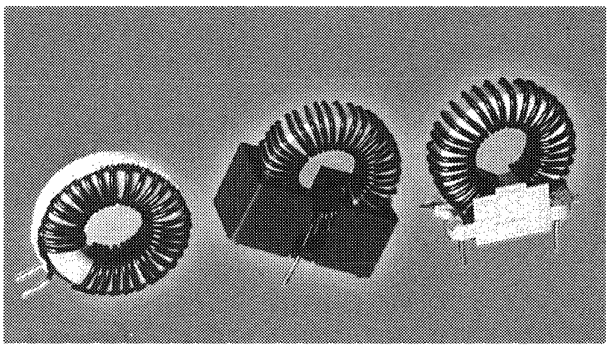
GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with the System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.



There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

Build Your Own Standard Part Number

To build your own part number, specify the series, inductance, current rating and case style. To optimize the inductance, size and current carrying capability, choose your part number from within the range of part numbers on the graphs below.

Example: **CMM 400 U F U**

- CMM — Series
- 400 — Inductance (a 'point' is represented as 'R')
- U — Inductance Unit: U = Micro Henry, M = Milli Henry
- F — Current Rating: B = .25 amp, C = .5 amp, D = 1 amp, F = 3 amps, G = 5 amps, H = 10 amps
- U — Case Style (See options below)

The strength of Tamura's AC and DC power conversion families lies in providing consistently dependable products. All Tamura power and magnetic devices are designed and manufactured to deliver lower AQL levels, guaranteeing you the lowest incoming rejection rates you've ever experienced. For example, last year we shipped over **100 million transformers**– most to customers using a **ship-to-stock** acceptance program.

At Tamura, we're already life testing (not just designing) tomorrow's products– today. Over 100 design engineers at our technology center are dedicated to this task, assuring you of having the most up-to-date technology in your products. Today we are already designing the robotics to build these quality products, in high volume and at low cost. Over 150 product support engineers at 16 Tamura factories see to it.

Satisfy your AC and DC requirements for today and tomorrow. Contact Tamura for your specific requirements.

Tamura quality circles the electron world.

MULTILAYER CHIP INDUCTORS (MLF SERIES)

TDK Multilayer Chip Inductors use magnetic materials and multilayer technology in producing epoch-making inductors which do not use any windings. TDK multilayer chip inductors use ferrite paste and electric conductor paste alternately layered in a completely monolithic structure. Inductor is obtained using a sintered closed magnetic circuit such as toroidal and a magnetic shield.

- No crosstalk between inductors due to magnetic shield. Perfect for high density installation.
- Unified automatic chip mounting shape with no directionality.

Designed to meet the requirements of MIL-C-15305, Grade 1, Class B (−55°C to +125°C). The rated temperature rise is 35°C above an ambient of 90°C. Overload current should not exceed 1.4 times the rated current. Dielectric withstanding voltage is 700 volts rms. The powdered iron cores used in these items possess excellent temperature stability and result in an inductor with low external magnetic field. This allows mounting in close proximity to each other and to other circuit components without ill effects.

PK 356 SERIES

SEE MIL-T-27/356 QPL LISTING FOR QUALIFIED PARTS

Ideally suited as switching regulator and coupled inductors, common mode chokes, or in other power filtering applications.

The PK356 series is approved to MIL-T-27/356 Specification Sheet, and meets the requirements of MIL-T-27E, Grade 5, Class S (−55°C to 130°C). The temperature rise is less than 30°C when measured at an ambient temperature of 100°C, 0.1 v rms, 10 khz, and at rated DC current as shown in the following Table.

A large selection of sizes provides maximum performance for minimum size. Each unit is magnetically shielded.

CASE	A Max	B Max Dia	C ±.010	D ±.010	Insert	Terminal Arrangement	Terminal Diameter Inches

The ratings in the Table below are for a series-aided connection of both windings. The inductance of a parallel connection of these windings will result in 25% of the inductance at twice the rated current. The DCR will be 25% of the series connection.

INDUCTORS

Fixed Inductors...Micro-Miniature and Miniature
AIE Magnetics fixed inductors offer the optimum in design efficiency and provide the highest inductances per unit of volume. These inductors provide your design solution in two distinct areas: (1) Small DC currents with non-critical temperature coefficient of inductance and (2) where DC current is a design factor and where a low temperature coefficient of inductance is desired.

TYPICAL APPLICATIONS
- *DECOUPLING NETWORKS*
- *FILTER CHOKES*
- *PEAKING AND COMPENSATING CIRCUITS*
- *TONE COLOR FILTERS*
- *OSCILLATORS*
- *TONE DECODING*

FEATURES
- *MICRO-MINIATURE & MINIATURE SIZES*
- *LOW TEMPERATURE COEFFICIENT OF INDUCTANCE*
- *ENCAPSULATED*
- *MIL-C-15303 FEATURES*
- *SOLDERABLE LEADS*
- *WELDABLE LEADS (Optional)*

Switching Regulator Inductors
AIE Magnetics manufactures a line of inductors for DC-DC converters, lower current outputs or switching power supplies. These inductors have been designed to operate with switching regulators, available from several semiconductor manufacturers, which operate in the 40-100 Khz range.

TYPICAL APPLICATIONS
- *BOOST CONVERTERS*
- *BUCK CONVERTERS*
- *BUCK-BOOST CONVERTERS*

FEATURES
- *REQUIRE MINIMAL CIRCUIT BOARD SPACE*
- *SHIELDED FROM RADIATING NOISE*
- *SEALED TO WITHSTAND ALL BOARD CLEANING PROCESSES*

Variable Inductors...Miniature
AIE Magnetics variable inductors are typical of our miniaturization efforts for high Q's and high inductances in a minimum of space. These printed circuit mount, shielded inductors offer top tuning for easy access. If your packaging demands dictate side tuning, we can modify our Series 38 for this purpose.

SHIELDING BEADS

SHIELDING BEADS

Ferrite shielding beads offer a convenient, simple and inexpensive solution for obtaining RF attenuation and suppression of undesirable high frequency oscillations without an attendant sacrifice in DC or low-frequency power.

Shielding beads are made in different materials. The material selection is determined by the desired impedance levels at the frequency of interest. As is evident from Figure 1, for frequencies up to 20 MHz, the 3E2A bead will provide more attenuation than an equivalent bead in 3B material. By using more than one bead, the impedance will increase at close to the same ratio as the increase in beads. Combining beads of different materials can lead to improved frequency response. See Figure 3 for a combination of a 3E2A and a 4B bead.

The beads 56 590 65 in 3E2A, 3B, 4A, 4A6 and 4B material can also be supplied on wire, taped and reeled.

WIRED BEADS

WIRED BEADS

To facilitate the use of ferrite shielding beads with automated component insertion equipment, beads are available assembled on copper wire.
The beads are cemented onto 22 AWG tinned copper wire and taped per EIA Standard RS-296-D. Inside tape spacing is 52.4 ± 1.5 mm. Missing component criteria per level 1.
Each 50th bead is identified by a marking of the tape. The wired beads, taped, are wound on a reel containing a maximum of 3500 beads.

WIDE-BAND CHOKES

WIDE-BAND CHOKES

Wide-band chokes are wound 6 hole ferrite slugs, made in 3B and 4B material, with 1, 5, 2.5 or 2 × 1.5 turns of tinned copper wire. These wide-band chokes are used for interference suppression in a multitude of applications.

Figure 1 shows the performance curves of these choke types. Above approximately 60 MHz, the impedance is substantially resistive and nearly constant. The wideband chokes may be used with small ceramic capacitors. The self resonance of the capacitor will provide additional attenuation. See Figure 2 below. The influence of a DC bias upon the performance is shown for the 2.5 turn chokes in Figures 3 and 4.

Note that where twin leads are accessible, double chokes (2 × 1.5 turns) may be used to take advantage of the mutual inductance.

RODS

RODS

Rods are used as a low cost solution in applications where a low effective permeability is acceptable. Flux concentrators such as antenna's and impeder cores are classical ferrite rod applications. However, in power designs, such as output chokes and differential-mode chokes, ferrite rods can be used as well.

EPC CORES

EPC cores are designed for thin (approximately 1 inch) power supply and have an installation height of 12 to 16mm, an elliptic center leg for easy winding, and 10 to 12 terminals for easy designing.
High-performance power ferrite PC40 employed in these cores enables a user to design a power supply for high frequency with less heat generation.

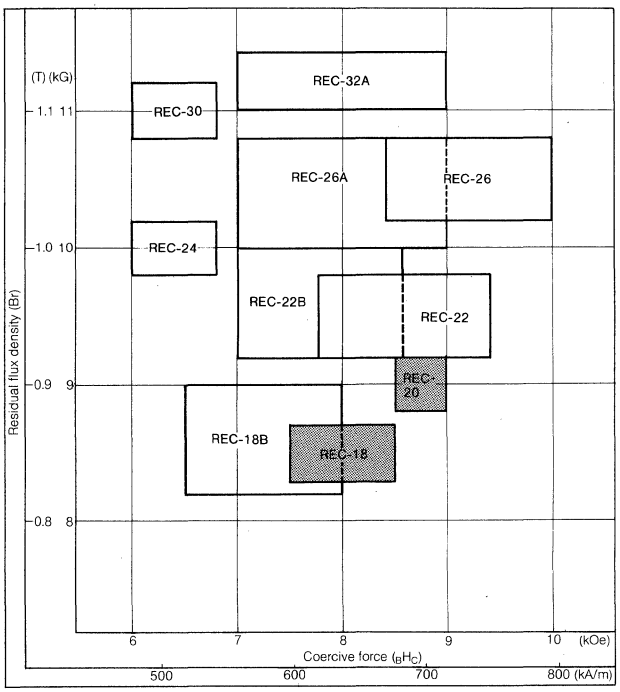
RARE EARTH COBALT MAGNETS (REC MAGNETS)



Demand for rare earth cobalt (REC) magnets has been increasing as that for smaller sized, higher efficient electronic equipment has never ceased to be active. TDK has a wide choice of REC magnets, including 2-17 series ones, whose excellent temperature characteristics compare Alnico. The conveniently small, easy-to-use TDK REC Magnets include the highest performing REC-32A and REC-30, REC-26A, REC-26, REC-24, REC-22, REC-22B and REC-18B, all power-efficient and high-performing.

Applications

Speakers, headphones, cartridges, microphones, printers, magnetic and optical disks, coreless motors, stepping motors, klystrons, magnetrons, isolators, circulators, various meters, noncontacting switches, sensors, watches, clocks, magnetic couplings, tools, magnetic medical instruments, etc.

EFRATOM is the recognized world leader in rubidium atomic precision time and frequency systems for military/aerospace and commercial applications. Utilizing state-of-the-art atomic oscillator technology, EFRATOM has conceived and developed a family of time and frequency references for radio navigation, geophysical survey positioning systems, satellite tracking and control, communication systems employing PCM and spread spectrum techniques and standard time and interval generation and transfer.

EFRATOM's Model M-3000 is a miniature military atomic oscillator measuring just 3.25 in × 3.25 in × 4.5 in (83 mm × 83 mm × 114 mm), yet this instrument has excellent long term stability and fast warm-up performance. Model M-100 and M-3000 rubidium oscillators are radiation hardened and offer unparalleled performance in the toughest of airborne and ground environments.

EFRATOM also offers modular frequency components, Model MFS in a 19 inch rack, permitting the user to configure unique time and frequency systems specifically for his application.

EFRATOM has also entered into quartz technology with a line of very high end crystal oscillators achieving state of the art specifications in terms of power (≤500mw @ −55°C), weight (≤40 gms) and size (≤2.2in^3) at aging rates of ≤5 × 10^{-10} per day. Model EMXO is the MIL-Spec unit and ECXO is commercial.

Model PC-10 is a rubidium based portable clock which can transfer time and frequency within 200 to 300 nanosec over an entire day of a clock trip.

Coldweld Vacuum Sealed

Although similar in appearance and configuration to a commonly used solder-sealed counterpart, Bliley's **BA** series features unexcelled process cleanliness and flux-free sealing in vacuum to minimize contamination. Improved aging and reliability result at a modest cost premium. The data following is suggested for general guidance. Superior performance in temperature stability and aging can be provided if required.

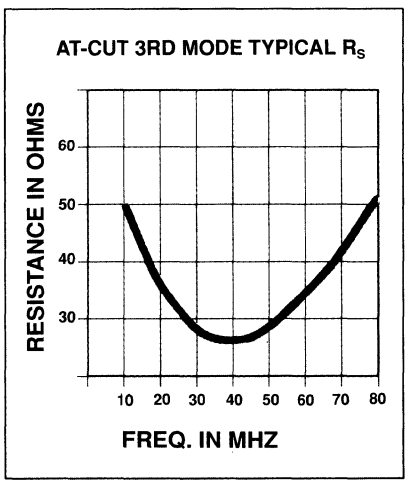
Custom Crystals



Bomar can provide AT Cut Crystals from 1 MHz to 160 MHz. The AT Cut operates on the fundamental and all odd overtones (3,5,7,9). This cut maintains the lowest of all temperature coefficients; supplies an extremely high Q, plus it offers an economical cost which makes it the standard for most oscillators such as temperature controlled as well as non-controlled types, and in filter applications. The frequency may be multiplied up or down as needed.

Product applications are in mobile, portable and base station communications; radio transceiver filters, modems, satellite frequency converters, and in any field where truly clean, drift-free reception is required.

Bomar features quick turnaround service–available for quantities up to 500 units per frequency. Please call for specific information on this program.

Comclok supplies a complete line of clock oscillators for your timing applications. You can be assured of a high quality product, produced with the most modern equipment. The crystal clock oscillators are hermetically sealed by resistance welding, in a pure dry nitrogen filled chamber, after a high temperature vacuum bakeout.

Comclok's very flexible manufacturing operation enables us to provide our customers with superior service. Whether your requirement is for a few pieces on a special frequency for engineering purposes or large volume production quantities, Comclok can meet your needs fast! We have no minimum order size, and our normal delivery time on orders from one unit to one thousand is three weeks. If that's not fast enough, we also offer one week or less emergency service.

Precision Quartz Crystal Resonators

I. DESCRIPTION

CTS High Stability Precision Resonators are used where specific tight parameter control is required. These crystals are used in communication, instrumentation, and military applications where specialized performance, documentation, or testing demands extra attention. These crystals are either calibrated at room temperature, or at elevated temperature for ovenized oscillator applications. Holder types see Fig. 8 and Fig. 9.

MIL-Equivalent Crystals

MIL-C-3098G requires special testing to ensure compliance with the entire specification. Any crystal marked with the "CR" number must receive this testing.

If your required crystal details match those of a mil spec in general parameters, but your commercial application does not demand the exhaustive testing, you can order a mil equivalent crystal. The design will be the same. The crystal **will not** receive the detailed testing. Marking will be standard commercial marking. The "CR" number will not appear on the crystal.

A mil vs commercial cross reference is shown below:

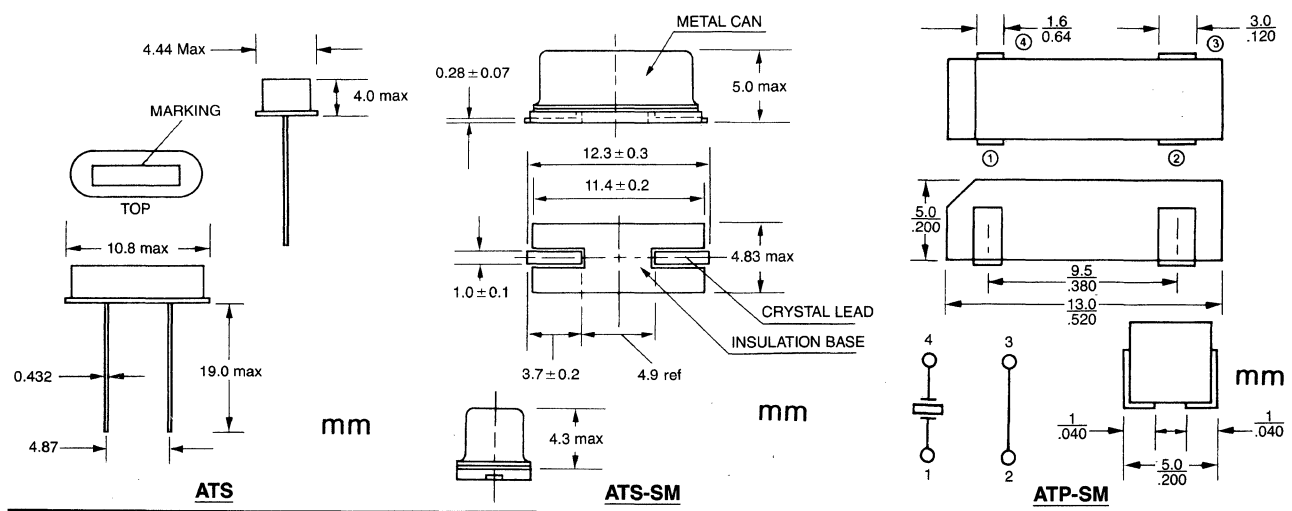
CTS Standard Microprocessor Crystals

CTS Knight offers 43 standard microprocessor crystals to use with many of the popular microprocessors on the market. CTS microprocessor crystals feature low start-up resistance. Reliability is assured by use of a MIL-approved Quality Control process. These are solder seal and resistance weld crystals with 0.5" minimum lead lengths.

Microprocessor crystals are available as "off-the-shelf" items from authorized CTS distributors.

Top wires and/or insulating sleeving can be ordered special with minimal cost and leadtime.



Standard Tolerance is ±.005% at 25°C and ±.005% over 0 to 70°C.

CTS AT-Strip Crystals

CTS Knights offers AT-Strip Crystals at Frequencies Tooled between 3.5M and 40.0MHz for use with microprocessors. The AT Strip Crystals offer improved shock and vibration performance with their reduced size.

AT Strip Crystals are offered in 3 package styles. The "ATS" Package has the same pin spacing as the Std. HC-49 with a lower profile. The "ATS-SM" is the surface mount version of the "ATS" and the "ATP" is a plastic surface mount package. The ATP-SM is available in tape & reel for volume applications. Contact the factory or your local distributor for list of frequencies and specification details.

If your application requires V_{DD} to be other than 5 VDC, please specify nominal V_{DD}, when ordering, to insure proper frequency accuracy and stability.

Surface Mount Hybrid Clock Oscillators

■SURFACE MOUNT APPLICATIONS—CTS Knights presently offers a number of options to suit your surface mount needs. Besides the CCXO series, leadless chip carriers, we are offering the MXO-55 style package in an economical surface mountable configuration, through a simple lead formation operation. The surface mount option is specified by adding an "S" to the part number (eg. SMXO-55, SCXO-65). Coplanarity for lead formed packages is ± .006" (max).

■VAPOR PHASE REFLOW—CTS Knights' standard hybrid oscillators are capable of withstanding hand and wave soldering processes, but are not manufactured to survive vapor phase reflow profiles without degradation to device reliability. All surface mountable products are built with a special, high-temperature construction process to allow vapor phase reflow.

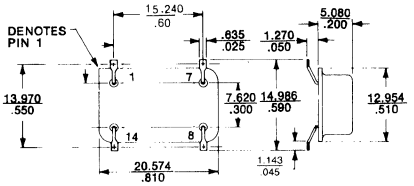

FIG. 13 SMXO-55

Standard DIP SERIES

The Standard DIP surface mount series squarewave crystal oscillator is contained in a rugged, economical .500" × .800", hermetically sealed metal package. The leads are shaped for surface mounting in a Gullwing design.

SPECIAL REQUIREMENTS

- ELECTROMAGNETIC INTERFERENCE PROTECTION
  The metal package construction, used extensively on CTS Knights hybrid oscillators, effectively reduces radiated EMI due to the oscillator circuitry. Further reduction can be accomplished by connecting the case to circuit ground, which is standard on MXO and CXO series oscillators. Case grounding is specified by a "G" in the part number (eg. MXO-55GA, CXO-65GA). CTS Knights has also gained considerable experience in reducing conducted EMI in specific customer applications. Contact CTS with your EMI problems or requirements, we'll offer a solution.
- CUSTOM DESIGN CAPABILITIES—CTS Knights' in-house capabilities include circuit design and artwork generation, crystal and hybrid thick film manufacturing facilities, manual and automated manufacture and test techniques, and mechanical and environmental testing. This gives CTS a unique flexibility to design and manufacture to your custom hybrid oscillator specifications. Consult the innovative staff at CTS Knights with your special requirements.

Piezoelectric Ceramic Elements

To Match Your Acoustic Product Design

Accuracy is critical. So is on time delivery. That's why acoustic product design engineers have depended on EDO Electro-Ceramic Division as a reliable source of ceramic elements for the last twenty five years.

At EDO Ceramics, fourteen different composite materials are used to create these various shapes of rings, discs, plates, bars, cylinders, and hemispheres, to meet the needs of military, commercial, and industrial users.

EDO is committed to developing and improving these products. And now, five new material compositions have been added with increased sensitivity, coupling, dielectric constant, and power handling capabilities.

You can depend on the quality of EDO products.

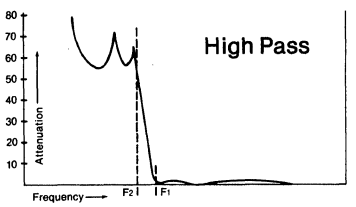
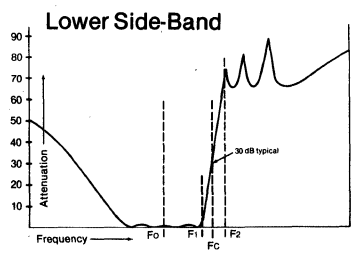
Filters and Networks

LC Filters • Crystal Filters Delay Lines • Discriminators from FSN FREQUENCY SELECTIVE NETWORKS, INC.



FSN is a filter and network house. We are strong in engineering. We are able and willing to work with system designers to apply state-of-the-art filter technology to optimize not just the filter but the application of filters to help our customers optimize their systems.

Use us as your filter specialist. We are knowledgeable in and have experience with all classes of filters, whether crystal or LC. We can select the proper type for best performance while optimizing the cost-vs-performance trade-off. We design and manufacture **all** the families such as: Butterworth, Chebyshev, Legendre, Cauer (elliptical), General Parameter, Gaussian, Bessel, Transitional Butterworth-Thompson (TBT) Bode, Lerner and others.



We also design and manufacture such other networks as delay lines, attenuators, phase and delay equalizers, discriminators, matching networks, etc.

VOLTAGE CONTROLLED CRYSTAL OSCILLATOR (VCXO)•1 MHz to 67 MHz

VOLTAGE CONTROLLED OSCILLATORS — 1 MHz to 66 MHz

Generates a TTL/HCMOS frequency output which is controlled by in input voltage. The end-point frequency/voltage parameters are defined, as is the center frequency voltage range, which is necessary for the VCXO to operate in a closed loop.

- **CAPTURE RANGE—**
  The Frequency-Capture range is equal to the Center-Frequency ± the Frequency Deviation, because every MF VCXO is ATE-tested to meet the Frequency-Deviation over the temperature range. It is not necessary to reduce the capture range by the stability.

USES
- To generate a clean signal from a phase-varying signal
- To multiply a frequency by an integer
- To detect the frequency modulation of an incoming signal

SUPER TIME SAVER!

Do you work with ICs? Do you have trouble finding the IC you need? Are you sick and tired of sifting through dozens of manufacturers' data books? Do you have trouble comparing one set of specs to another? Are you sick and tired of wasting time?

Do we have good news for you! Get your hands on the latest annual copy of the IC Master. The Master will save you both time and money. Here's how.

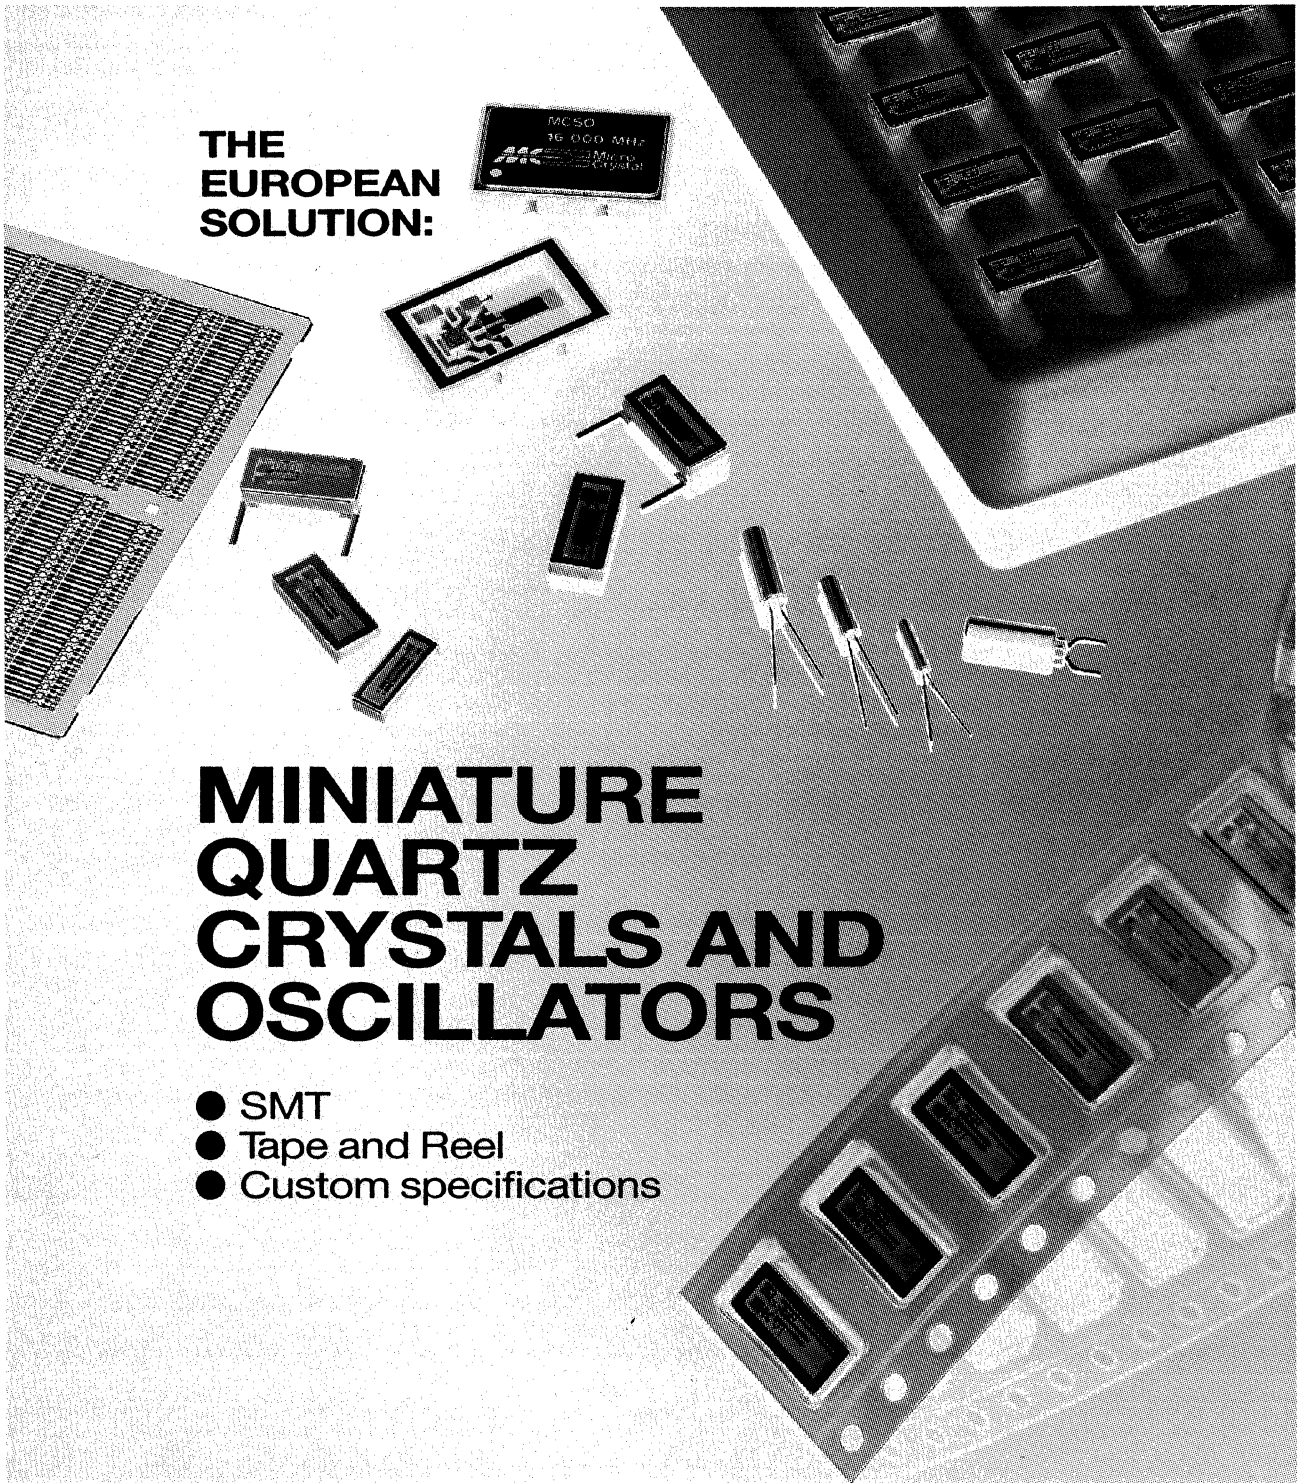
The Master lists every single IC you can buy. Better yet, the Master lists ICs by function. You know what you want to do. The Master tells you who makes what for what you want to do.

There's more! The Master lists every known alternate source to every integrated circuit. If somebody makes a substitute for an IC, the Master tells you. And fast!

Want to find a custom or semicustom IC? The Master tells you who the manufacturers are, what their capabilities are, and what design tools you need.

Looking for a distributor or a local sales office? The Master tells you where they are. Got a technical problem? The Master tells you who to call. Can't figure out a part number? The Master tells you how the part number systems work.

There's more! The Master has a section on microprocessor development tools with complete performance parameters. There's another section on programmable logic devices giving you everything from output configuration to PLD development systems.



Want to know if there's an application note available on a given part? The Master tells you!

If your question has anything to do with integrated circuits, you need the IC Master. Subscribe now by calling (516) 227-1314. Ask for Marie Botta. Tell Marie you need the Master now.

If you prefer, write to Marie, Hearst Business Communications, 645 Stewart Ave., Garden City, NY 11530. She'll mail you the IC Master subscription form right away.

And, if you tell her you saw it in the 1991/92 EEM, she'll take $10 off the subscription price!

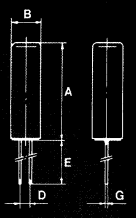
FREQUENCY: 10 – 200 kHz

FEATURES:
- SMD versions in Tape and Reel
- High shock resistant
- Very price competitive



DESCRIPTION
The MX quartz crystal is a miniature chemically milled tuning fork whose performance/price ratio benefits from Micro Crystal's know how acquired in producing hundreds of millions watch tuning forks. The crystal is sealed under vacuum in a tubular ∅ 2 × 6 mm metal can. The standard version can be implemented at temperatures up to 210° C whereas the high temperature version withstands 260° C (20 s max). Two configurations are available, i.e. straight leads for thru-hole mounting or bent leads usually supplied in Tape and Reel for automatic surface mounting. The manufacturing operations are completely automated thus resulting in a very ***reliable*** and ***low priced*** product.

APPLICATION
The MX quartz crystal is intended for use in electronic timing circuits designed for low power consumption (e.g. Pierce oscillators). Due to miniature size, it has extremely high shock resistance.

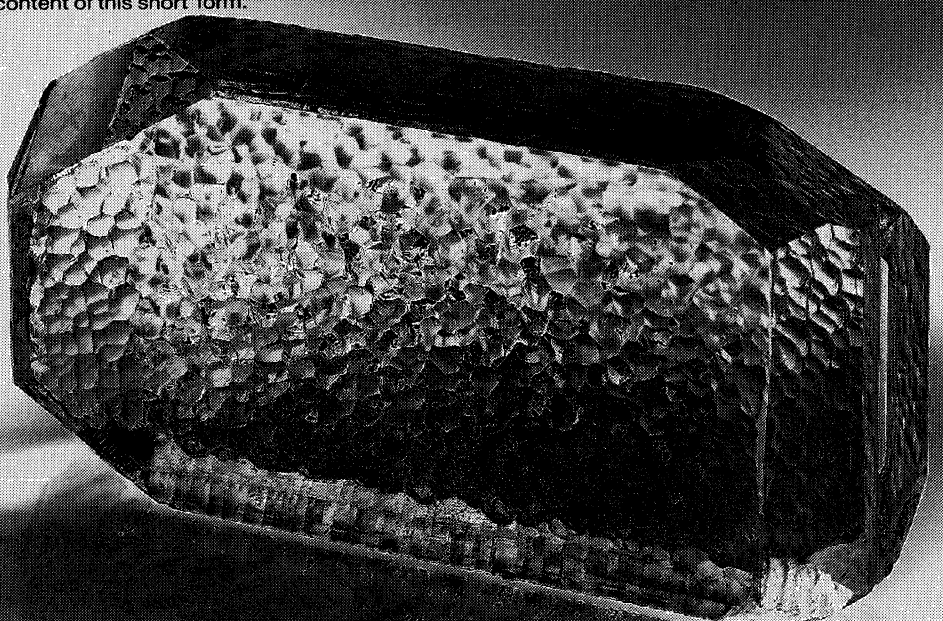
Micro Crystal was founded in 1978 and is a member of SMH, the largest Swiss group of companies manufacturing watches and microelectronics. Since its founding Micro Crystal's productions has soared to over 50 million miniature Quartz crystals per year.



TECHNOLOGY

Micro Crystal produces chemically milled quartz resonators of different shapes and functions: tuning forks, length extensional resonators, thickness shear AT strips and vibrating crystal sensors. All crystals are etched out of accurately machined wafers using a well proven photolithographic batch process.

QUALITY ASSESSMENT

In order to meet customer specifications, Micro Crystal conforms to worldwide acknowledged quality assurance standards like ISO 9000 and to military specifications for quartz crystal units (MIL C 3098 (3) which define environmental and physical characteristics test conditions. The Quality Assurance system is smartly integrated into the manufacturing scheme as well as into design and development work such that all employees be aware of their contribution to the overall quality level.

FREQUENCY SYNTHESIZERS HIGH PERFORMANCE OSCILLATORS

RF to 23GHz

- 1Hz resolution at all frequencies.
- No phase pops.
- 1 μsec switching speed.

State-of-the-art phase noise.

Micronics' new "M-line" of modular frequency synthesizers utilizes proprietary functional topology and integrated microwave structures to provide users with a new price/performance standard. In addition, application-specific synthesizers can be configured with minimal N.R.E.

A wide array of synthesizer configurations (from RF to 23 GHz, with standard frequency resolutions of 1 Hz, 1 KHz, 100 KHz, 125 KHz, and 1 MHz) are available, thanks to modular design and Micronics' vast selection of microwave components.

The modules are configured for either vertical or horizontal mounting. A complete four-module microwave synthesizer with 1 Hz resolution stacks in a 3½" chassis. Circuit boards employing surface mount construction are housed in cast aluminum modules with filtered interconnections to ensure mechanical strength and R.F.I. compliance. A daisy-chained ribbon cable provides complete power, programming, and BITE information.

Micronics also offers two lines of high performance oscillators. The HI "Q" Coaxial Phase Locked Oscillator series covers the frequency range of 800 MHz to 3000 MHz. These units provide excellent phase noise performance and are ideally suited for use in satellite communication systems. Micronics Dielectric Resonator Oscillator series covers the frequency range of 3 GHz to 18 GHz. These units are available as either free running or phase locked.

Oscillators

MH series...
M-tron's MH series crystal clock oscillators provide state of the art HCMOS logic in packages HALF the size of conventional clock oscillators with TTL compatibility and enable/disable option.

ML series...
M-tron's ML series low power CMOS clock oscillator was developed originally as a stable time base generator for battery powered smart munitions. These oscillators use a 32.768 kHz tuning fork crystal as the primary timebase.

ME series...
M-tron's ME series ECL clock oscillators provide excellent rise and fall times, duty cycle, and power supply noise rejection. The ME is available from 50 to 150 MHz.

MV series...
M-tron's MV series VCXO's are HCMOS and TTL compatible, with output drive capability rated at 10 TTL gates or 50 pF HCMOS loads. Pullabilities up to ±200 ppm are available.

Communications Components

M-tron involvement in military programs has led to the development of components for local area and wide area real-time data communications. Typical of these activities is a device involved in an ongoing battlefield LAN development program which incorporates advanced DTMF techniques.

OUR PRODUCTS

OCXO'S

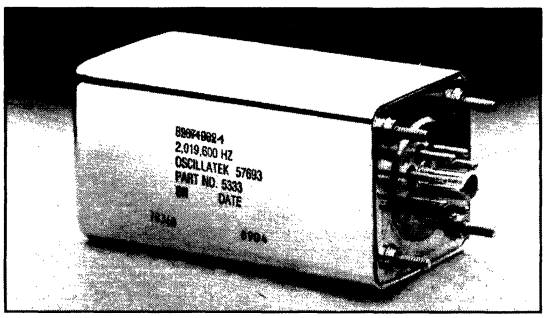
Ovenized crystal oscillators offer very good stability versus temperature, especially in applications where space and power are not at a premium. Our expertise here is in thermal and mechanical design.

TCVCXO'S

Voltage-tuned TCXO's for low-distortion linear and phase-locked loop applications are another Oscillatek strength.

TCXO'S

Our temperature compensated crystal oscillators are used in applications where reliability, size, weight and power requirements are difficult to meet with ovenized oscillators. Our computer-aided compensation network synthesis technique allows us to use a minimum number of components most effectively to reduce compensation error to the minimum possible.



CLOCK OSCILLATORS

Our crystal-controlled thick film hybrid clock oscillators offer high reliability in small packages. We offer many standard packages including DIP, TO-5, TO-8, Flatpack and LCC. One of our specialties is very high frequency clock oscillators. All hybrid oscillators are manufactured in our new, controlled-environment clean room.

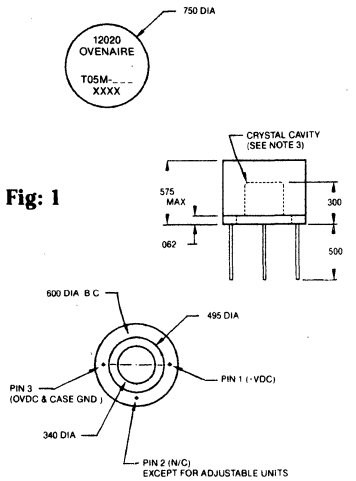
ovenaire mini - control ovens



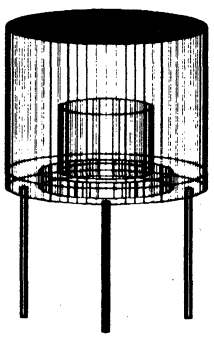


Fig: 1

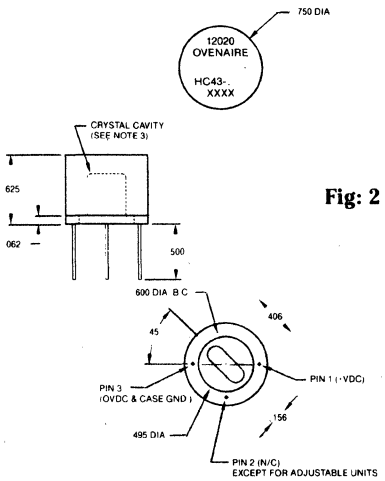

Fig: 2

A miniature component oven is a small electronic device that will reduce the variation in temperature for a given component or circuit by a factor of 10 to 100. In general, if no care has been taken to reduce thermal leakage from the oven and the device to be heated, the reduction factor will run about 10. It is necessary to take special care to insure that thermal loss will be kept to a minimum in order to approach the 100 to 1 reduction. It is important to look at the basic operation of the oven and sources of thermal leakage to get a feel for how this can be done.

With the increasing demand for more accuracy in electronic equipment, it is often found that the performance of a component or circuit over a given temperature range is not adequate. This is especially true if the equipment is to be used over a wide range of temperatures. In many cases it is possible to improve the performance considerably by the use of a miniature component oven. The incorporation of an oven in a given piece of equipment or on a printed circuit board is not simply a matter of applying the oven to the board and assuming that the problem has been solved. There are certain factors which must be taken into consideration prior to using these devices if they are to serve their intended purpose.

ovenaire customized ovens

The component oven consists of three basic parts, a heater, a temperature sensor, and a control circuit. The heating element is usually some form of resistance device which is used to convert electricity to heat. The temperature sensor is usually a temperature variable resistor such as a thermistor. The control device in its simplest form is a thermostat. A thermostat serves as both the temperature sensor and controller. It has a set of contacts which opens the circuit when a certain temperature is reached. In more complex ovens the controller is an electronic circuit which reads the temperature sensor and when the selected temperature is reached, the circuit reduces the current to the heater. This circuit is referred to as a proportional controller because during normal operation, the controller continuously changes the oven current in response to changing amounts of heat loss in order to keep temperature constant.

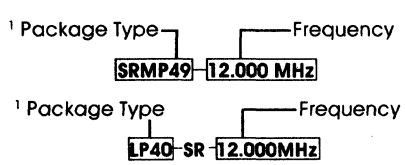
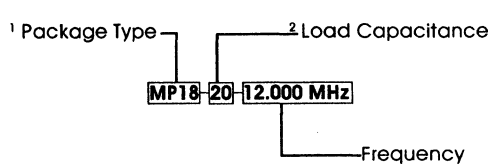
CRYSTAL SELECTION GUIDE



The PLETRONICS Quartz Crystal Selection Guide has been prepared to assist you in selecting the crystal you need. As long as you know what frequency you want, and you know what package you would like, you can easily find the desired part number. If you can't find a basic part number in this guide to meet your needs, call for help. We will gladly help you prepare the appropriate special part number and, of course, the custom crystal to fit your unique application. And we'll do it faster than you would have believed possible.

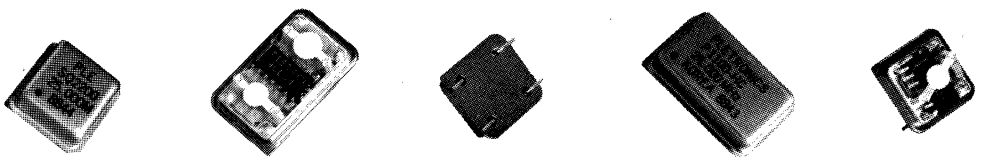


CRYSTAL PART NUMBERING GUIDE

The PLETRONICS Crystal Part Number is composed of three major elements: (1) the crystal package type, (2) the frequency of operation, and (3) the calibration method. If the crystal has been calibrated at series resonance, the package number will be preceded or followed by "SR". If the crystal has been calibrated at parallel resonance, the package number will be followed by the load capacitance value in picofarads.

- When calibration is at **series resonance**:

- When calibration is at **parallel resonance**:



[1]Package Type: See Selection Guide above
[2]Load Capacitance: Specified by customer in picofarads (pF)

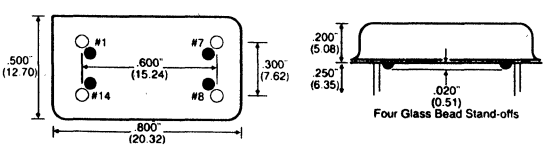
P1100-3S Clock Oscillators (Tri-State — Enable/Disable Clock Oscillators)

These "True" tri-state clock oscillators are fully HCMOS and TTL compatible. When the input at pin 1 is in "Enable State," the output at pin 8 is also in "Enable State" (normal). When the input at pin 1 is in "Disable State," the output at pin 8 is also in "Disable State" (high impedance). The input is normally disabled by grounding pin 1. Thus, with pin 8 in the high impedance condition, the unit is ready to receive test signals or to connect to alternative circuits.

—Enable/Disable input requirements at pin 1:
Vih 0.6 Vcc minimum Vil 0.4V maximum
Iih 10μA maximum Iil -150μA maximum

DF1100 Series Clock Oscillators

These clock oscillators contain two independently operating crystals in one package: One independent output from Pin 1, the other independent output from Pin 8.
—Frequency Range: Pin 1: 4 MHz to 60 MHz.
Pin 8: 4 MHz to 60 MHz.



—Both outputs are TTL and HCMOS compatible.

P1100-SC Series Clock Oscillators

These clock oscillators compatible with 4000 Series CMOS are designed for applications requiring high voltage and low current consumption. Available frequency ranges depend on the input voltage specified as follows:
—When Vcc = 12 to 15V, 250 Hz to 15.00 MHz.
—When Vcc = 9 to 12V, 250 Hz to 12.00 MHz.
—When Vcc = 6 to 9V, 250 Hz to 8.00 MHz.

TTL

Standard TTL outputs can drive up to 10 TTL loads. Some Q-Tech clocks use low power Schottky (LS) dividers and gates to reduce internal power consumption. These units drive 2 TTL loads or 4 LS loads over the full military temperature range.

CMOS, HCMOS, ACMOS & "Z" DRIVERS

Q-Tech **"C"** type clock oscillators are compatible with the **high voltage, 4000 series CMOS** logic family. Frequencies from .01 Hz to 15 MHz and voltages from 5 volts to 15 volts are available.
The **"HC/AC"** clock oscillators match the **High Speed CMOS** logic family. Q-Tech HC/AC clocks produce rail-to-rail CMOS logic levels at frequencies to over 100 MHz. These units can drive one TTL load or high capacitance CMOS and NMOS loads.
Options available in the HC/AC line include provisions for **special symmetry** option, a **low current** option for battery operation when the output frequency is below to 100 KHz, and optional 10 TTL drive capability. Although normally run at 5.0 volts like TTL, HC clocks can operate down to 2.5 volts, with some restrictions on maximum frequency.
The **"Z"** type clock oscillators have **more power to drive very high capacitance loads.** Use "Z" designation in part number: e.g. QT6Z9M—12 MHz. This unit can drive 150 pF load with a typical 6 nanoseconds (ns) rise & fall times (t_r, t_f).
Extra outputs, gates, special digital functions and automatic testing provisions can often be included at low cost.

ECL

The ECL logic family is characterized by **very high speed** (clocks available to 200 MHz.) Q-Tech ECL clocks use 10K, 10KH, 100K and ECLinPS for compatibility with most ECL systems.
ECL components typically use a negative **Vcc of – 5.2 Volts D.C.,** referenced to ground pin. for example, the Q-Tech QT48 package, built as an ECL clock, would use – 5.2 Volts on pin 7 ("Vcc") and ground on pin 14. Other pin configurations are also available.
2 new ECL options are available (QT6E1 and QT41E1 series) with quick delivery on standard frequencies. For more information, request bulletin **ECL.**

Available Features:

1. Full Military Temperature range
2. Internal bias (Vbb) available on a pin
3. Low cost commercial version (request bulletin ECL)
4. A.C. coupled output for r.f. applications
5. Custom clocks with gates, complementary outputs, etc.
6. Positive Vcc.
7. Custom load requirements.

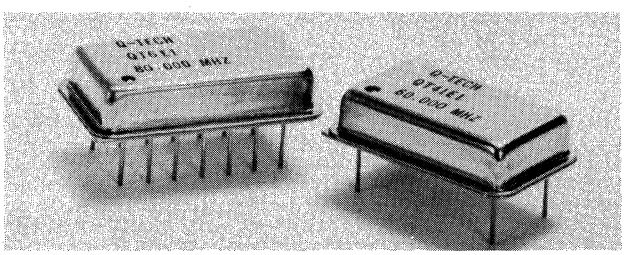
SURFACE MOUNT CRYSTALS

Q-Tech is introducing its new line of Surface Mount Crystals: the ***QX64A*** (85 mils thick) and ***QX64B*** (65 mils thick) ***series*** with a frequency range of 5 MHz to 125 MHz. These surface mount crystals can withstand full military environmental testings. They are hermetically sealed in a 40 pad LCC with any pin configuration at no extra charge. They are also available in swept quartz for ***radiation hardened applications.*** For more details please request bulletin ***SMX.***

Surface Mount Crystals

ULTRA-SMALL HF AND VHF SOURCES

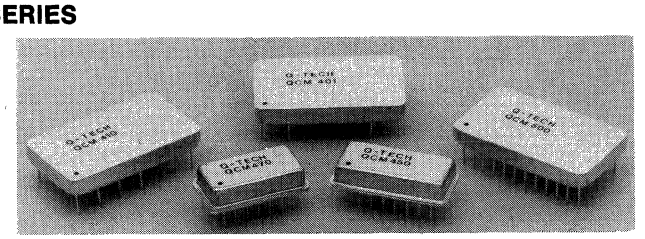


Q-Tech's crystal controlled oscillator model ***QT-815*** is available in the frequency range from 4 MHz to 500 MHz. With a package size of just 1.66 in. x .875 in. x .275 in., the ***QT-815*** is one half the size of competing units with no compromise in specifications. Features include: Low noise, crystal stability, + 7 dBm output, low DC current. Other packages and options available. For full details please request bulletin ***QT-800.*** Also, see page four of this ad.

VCXO'S

Q-TECH ***Voltage Controlled Crystal Oscillators*** can be ***"frequency shifted"*** or ***"controlled"*** with an external voltage source. Q-Tech VCXO's, often used for frequency synthesis, clock recovery and other phase lock loop applications, are available in DIP packages as well as custom packages. Typical deviation (pulling) is +/– 100 ppm for a control voltage range of 0 to 5 volts. VCXO's requiring a wider pull range, improved linearity, ECL or sinewave output are also available. Integrating the VCXO, the loop filter and the phase detector into one small package can reduce cost, space and system noise. Q-Tech Voltage Controlled Oscillators (VCOs) are also available.
For more details, please request the VCXO bulletin.

ECL CLOCK OSCILLATORS



In addition to its complete line of ECL Clock Oscillators, Q-Tech now offers another version of unscreened and fast delivery ECL in 2 standard DIPS: ***QT6E1*** (14 pin DIP) and the ***QT41E1*** (4 pin DIP) ***series.*** These units operate at – 5.2 Volts with a frequency range of 1 MHz to 200 MHz. For more details please request bulletin ***ECL.***

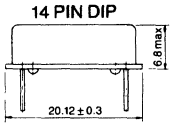
MGX0 SERIES OSCILLATORS

- ☐ 14 Pin DIP Compatible
- ☐ TCX0 Specs/Low Power
- ☐ Extremely Shock Resistant



The DS-MGX0 series oscillators use miniature GT cut crystal units (DS-MGQ) developed by SEIKO INSTRUMENTS. Their excellent frequency temperature characteristics (down to +2.5ppm over temperature) make the DS-MGX0 ideal for applications, such as cellular telephones to facsimile machines and computer designs.

The DS-MGX0 incorporates precision electrical adjustable capacitance (PEAC) elements verses the use of trimmer capacitors. PEACs are floating gate semiconductor elements that can vary internal capacitance by applying voltage to pin #1 (#3 for SM model). When not adjusting frequency, voltage can be removed and the PEAC maintains the capacitance setting. The PEAC coupled with the excellent temperature characteristics of the DS-MGQ enable +2.5ppm temperature stability over a wide temperature range.

SUPER TIME SAVER!

Do you work with ICs? Do you have trouble finding the IC you need? Are you sick and tired of sifting through dozens of manufacturers' data books? Do you have trouble comparing one set of specs to another? Are you sick and tired of wasting time?

Do we have good news for you! Get your hands on the latest annual copy of the IC Master. The Master will save you both time and money. Here's how.

The Master lists every single IC you can buy. Better yet, the Master lists ICs by function. You know what you want to do. The Master tells you who makes what for what you want to do.

There's more! The Master lists every known alternate source to every integrated circuit. If somebody makes a substitute for an IC, the Master tells you. And fast!

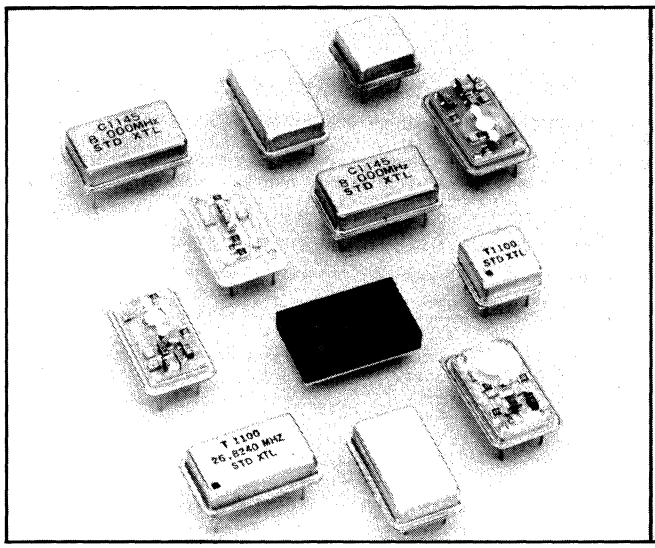
Want to find a custom or semicustom IC? The Master tells you who the manufacturers are, what their capabilities are, and what design tools you need.

Looking for a distributor or a local sales office? The Master tells you where they are. Got a technical problem? The Master tells you who to call. Can't figure out a part number? The Master tells you how the part number systems work.

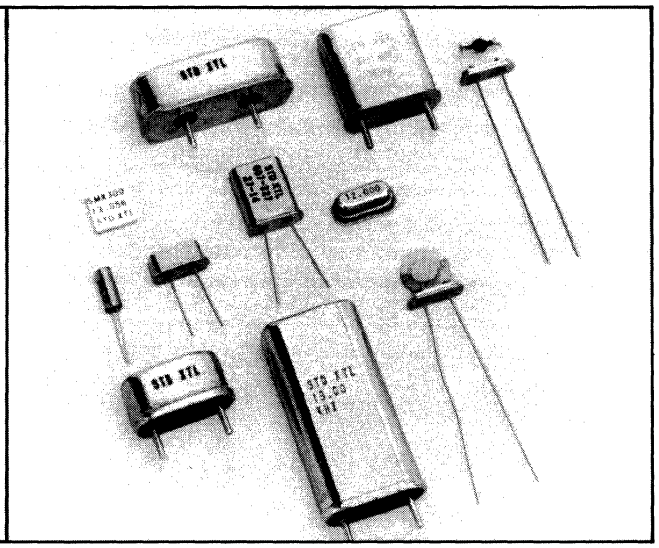
There's more! The Master has a section on microprocessor development tools with complete performance parameters. There's another section on programmable logic devices giving you everything from output configuration to PLD development systems.

Want to know if there's an application note available on a given part? The Master tells you!

If your question has anything to do with integrated circuits, you need the IC Master. Subscribe now by calling (516) 227-1314. Ask for Marie Botta. Tell Marie you need the Master now.



If you prefer, write to Marie, Hearst Business Communications, 645 Stewart Ave., Garden City, NY 11530. She'll mail you the IC Master subscription form right away.



And, if you tell her you saw it in the 1991/92 EEM, she'll take $10 off the subscription price!

ICMASD...IC Alternate Source Directory

The all new 1991 version of the world famous Alternate Source Directory is now available in floppy disk form for your IBM XT & AT and 100% compatible personal computer with hard drive.

The **1991 ICMASD** contains the more than 180,000 listings that appear in the Alternate Source Directory Section contained in Volume Two of the printed version of the 1991 IC Master ...plus additional discontinued parts. The database includes complete vendor addresses and phone numbers.

You can personalize the **ICMASD** for your application. The program allows you to add comments, up to 20 digits long, to each listing. These comments can be part numbers, prices, or any information specific to your needs. You may also add, delete and/or discontinue devices!

For greater flexibility the base number search feature enables you to access parts by base number, i.e., the device number stripped of prefixes and suffixes. You don't need to know the manufactures codes to call up any of the alternates to these devices.

The **1991 ICMASD** is fast, convenient and very user friendly!

Complete program documentation is included. When ordering, be sure to specify if you want the **1991 ICMASD** on three, double-sided, double-density disks OR on one high-density disk.

For immediate delivery you can order the **1991 ICMASD** at $179.50* simply by charging your Visa or MasterCard credit card. To place your order or for more information, call or write:

*The following notes apply to options C, F, I, L and N (± 200 ppm deviation)
- They are only available at frequencies up to 25 MHz
- Linearity of ± 10% is standard
- Models CO-231V and CO-236V, which are normally packaged in a 1.5" x 1.5" x 0.5" metal can with epoxy base, require a metal base which increases height to ⅝"; pin diameter is then .030".

XSIS

The QPL Source for Hybrid Oscillators M55310/8, 11, 14, 15, 16, 17, 18, 19

XSIS has earned the reputation among OEM's as the industry's most reliable supplier of advanced-design microcircuit crystal oscillators. Superior designs and consistent high-quality workmanship make the XSIS oscillators virtually failure-free. Overall quality and the industry's best on-time quoted delivery make XSIS the supplier of choice for hi-rel hybrid oscillators.

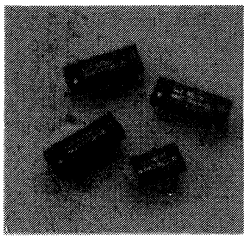
TTL — CMOS — HCMOS — ECL — GATED — SCHOTTKY — MULTI- FREQUENCY OUTPUTS

All oscillators manufactured by XSIS are tested for all electrical parameters over the operating temperature range. 100% screening tests include fine and gross leak, constant acceleration, automatic temperature cycling and electrical tests plus 160-hour power-on burn in. When required, other testing may include PIND test, destructive and non-destructive bond pull test and die shear test. These tests are also performed in-house on a continuous sampling basis to insure consistent quality.

Environmental tests performed in-house include shock and vibration, salt spray, moisture resistance and 8-hour steam aging.

Temperature, humidity, airborne particulate levels and electrostatic discharge (ESD) conditions are monitored and controlled in our expanded engineering, production assembly and test areas.

XSIS Electronics, Inc. is an OEM certified supplier and our only product is the superior hybrid crystal oscillator. As a QPL source, all XSIS microcircuit oscillators are manufactured to the electrical and mechanical parameters of MIL-O-55310, workmanship standards are in accordance with MIL-H-38534, the product assurance program plan is in accordance with MIL-STD-790E, and the quality system is as required by MIL-I-45208B.



- Calibration accuracy: ± .0015% @ +25°C.
- Frequency stability-vs-temperature: ±.005% over -55°C to +125°C
- Frequency aging @ +25°C: ±.0005% per year
- Lowered input current
- Unique, rugged design for high shock and vibration environs
- Resistance-welded, hermetically-sealed .480" square LCC and 14-pin DIP packages for utmost long-term reliability

DIGITAL DELAY OSCILLATOR SERIES 0458

This delay oscillator works as an asynchronous start-stop free running clock pulse generator. The oscillator is intended as the primary control element of state machines used in digital controllers. The assertion of the input (high) trigger causes the oscillator to free run, producing TR thru T4 clock pulses for as long as the input is asserted. Oscillation ceases when the input trigger is negated.

1. Delays measured at 1.5V level on leading edge only.
2. Delay tolerances: ± 5% or ± 2 ns whichever is greater, referenced from input and guaranteed only under the following test conditions: V_{CC}=T_{YP},T_A=T_{YP}, E_{IN}=3.2V, T_{RI}=2 ns, T_w=T_d, d=33%, R_L=1 megohm and C_L=15 pf.
3. Temperature coefficient of delay will vary, depending upon total delay, according to the formula: TC= 300 + (25,000/T_d), in ppm/°C.
4. Delay will vary approximately 4% for every 5% change in supply voltage.
5. Risetime measured from 0.75V to 2.4V level.
6. Measured with no loads on taps.

Over the past two decades, **Kappa** has optimized, packaged, and critically tested literally thousands of specific variations of several hundred different passive and hybrid delay lines: fixed tapped, continuously adjustable, and electrically trimmable (varactor-tuned) lines; over virtually the complete signal spectrum from control (subaudio), through audio, sonar, RF, HF, and a wide variety of pulse rates widths and duty cycles.

Typical design families include:

- PRECISION SONAR DELAY LINES (Series A) 500 μsec to 10^6 μsec ±1%; linear to ±0.05%
- LOW-DISTORTION LINES (Series D) Delay-to-Risetime Ratio: 50 max; Bandwidth: 50 MHz max
- MINIATURE CONTINUOUSLY VARIABLE DELAY TRIMMERS (Series TT) Size: 1/4 Cubic Inch; up to 120 ns; resolution ≤0.25 ns.
- SUPER-η™ DELAY LINES (Series H) Embody New Design Principle Providing the Highest Efficiency yet Obtainable in Lumped-Constant Delay Lines.
- MINITRIM DELAY LINE (Series MT) Resolution Less Than .5 ns and Delay Ranges Up to 300 ns.
- VIDEO BROADCASTING DELAY LINES (Series BC) Widely Used in the Most Demanding Color TV Applications in American and European Systems.
- TRANSPONDER/TACAN/DME (Series C) Designed to Meet the Requirements of MIL-D-23859 and to Withstand the Most Rigorous Military Environments.

SUPER TIME SAVER!

Do you work with ICs? Do you have trouble finding the IC you need? Are you sick and tired of sifting through dozens of manufacturers' data books? Do you have trouble comparing one set of specs to another? Are you sick and tired of wasting time?

Do we have good news for you! Get your hands on the latest annual copy of the IC Master. The Master will save you both time and money. Here's how.

The Master lists every single IC you can buy. Better yet, the Master lists ICs by function. You know what you want to do. The Master tells you who makes what for what you want to do.

There's more! The Master lists every known alternate source to every integrated circuit. If somebody makes a substitute for an IC, the Master tells you. And fast!

Want to find a custom or semicustom IC? The Master tells you who the manufacturers are, what their capabilities are, and what design tools you need.

Looking for a distributor or a local sales office? The Master tells you where they are. Got a technical problem? The Master tells you who to call. Can't figure out a part number? The Master tells you how the part number systems work.

There's more! The Master has a section on microprocessor development tools with complete performance parameters. There's another section on programmable logic devices giving you everything from output configuration to PLD development systems.

Want to know if there's an application note available on a given part? The Master tells you!

If your question has anything to do with integrated circuits, you need the IC Master. Subscribe now by calling (516) 227-1314. Ask for Marie Botta. Tell Marie you need the Master now.

If you prefer, write to Marie, Hearst Business Communications, 645 Stewart Ave., Garden City, NY 11530. She'll mail you the IC Master subscription form right away.

And, if you tell her you saw it in the 1991/92 EEM, she'll take $10 off the subscription price!

ACTIVE DELAY LINES (ADL-H/EDL SERIES)

TDK Active Delay Line ADL-H/EDL Series are 5-output (EDL: 2-output) lumped constant type delay lines with built-in TTL logic elements (Schottky type). In addition. TDK multilayer chip inductors are employed as inductance elements, and by combining these with multilayer chip capacitors, a compact, high reliability construction has been obtained.

Features

- Contained in DUAL-IN-LINE type package.
- Excellent quality due to transfer molding using high quality resin.
- A low height of only 5.08mm maximum is realized as a result of using TDK chip inductors and multi-layer chip capacitors.
- Since a TTL IC is built in, waveform shaping is not required.
- IC autoamtic insertion equipment can be used.

Technitrol delay-module performance is widely known and highly regarded by both military and commercial users. Many models, such as the ultrastable STTLDL shown below, are unmatched in performance and reliability. Designed primarily for high-performance applications, the STTLDL has very high output stability over a wide range of temperature and input-voltage variations. Increasingly, the STTLDL is selected as a commercial prototype for brand-new designs — and then written in because of the superior performance it offers.

We invite you to consider the STTLDL as an example of Technitrol capability. Its technology is an integral part of all our delay modules.

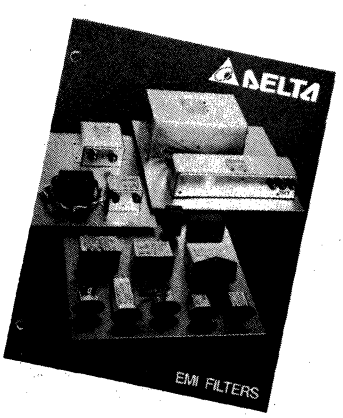
—Both crimped and soldered connections. 5
—Anti-rotation terminals to prevent open connections. 6
—Corrosion-proof case. 7



4. Quality control
—100% tested for Hipot, leakage current and insertion loss before and after potting.
—Less than 200 parts-per-million (ppm) defect rate.
—Approved for Ship-to-Stock program (no incoming inspection) at major computer manufacturers' facilities.

5. Availability
Standard items are maintained in stock in Northern California for immediate shipment to OEM customers and distributors throughout North America.

6. Price
Delta filters are very competitively priced due to mass production techniques and cost-saving designs.

7. Custom Design and Testing Services
Delta has engineering labs and shield rooms in Taipei and Northern California. These facilities allow us to design and fabricate custom filters to meet special requirements not met by standard filters, and to test customers' equipment for compliance with FCC and VDE conducted emission requirements. ELPAC COMPONENTS 32 YEARS OF EXCELLENCE

EMI FILTERS MADE EASY

EMI AND EMI FILTERS

EMI stands for electromagnetic interference. EMI is unwanted electromagnetic energy, usually in the frequency range used for communications, 10 KHz to 2 GHz.

EMI can disrupt the operation of electric and electronic equipment. This is when EMI filters are needed. They shield equipment from harmful EMI and they reduce EMI emissions.

WHAT ABOUT EMI REGULATIONS?

Major industrialized countries have established limits for EMI. In the United States, industrial and consumer products are governed by the Federal Communications Commission. FCC 20780 is the specification for RF interference of electronic devices. This specification is for Class A computing devices (commercial, industrial or business) and Class B devices (residential).

For military products, the U.S. Department of Defense standards are MIL-STD-461. This regulation specifies limits on electromagnetic interference emissions and susceptibility characteristics. There are nine categories ranging from aircraft (Class A1) to commercial equipment (Class C3).

In Europe, the accepted regulatory agency is Verband Deutscher Electrotechniker (VDE).

There are often special EMI restrictions for equipment used to process secure information. The most widely used limits for data security are the U.S. Government's Tempest standards. The word "Tempest" refers to the study and containment of emissions which, if intercepted and analyzed, could reveal sensitive information.

WHAT EMI FILTERS ARE NEEDED?

The right filter depends on (1) the system requirements and (2) the specifications of the appropriate regulatory agency. For example, a normal electronic system environment might only require.

- ☐ subsystems operating compatibly with each other.
- ☐ adequate enclosure shielding to comply with the radiation limits of either FCC 20780, VDE 08871/0875, or MIL-STD-461.

A more stringent, Tempest secure system might require:

- ☐ complete EMI filtering of every incoming and outgoing signal line.
- ☐ total shielding of radiated emissions by EMI gasketing.
- ☐ a completely secure metal enclosure.
- ☐ a high insertion loss AC power line filter to eliminate signal noise back onto the AC power line.

For either application, or for systems that fall in between, the best approach usually requires custom filter technology provided by a company such as ELPAC.

WHY ELPAC?

ELPAC has an extensive line of standard filter components. However, most of our customers need a custom design. That is where ELPAC's 32 years of experience really pays off. We specialize in custom signal and power line filters, particularly applications requiring minimum size and weight.

ELPAC can quickly prototype and manufacture custom filters. One reason is our highly trained engineering staff. Another is our use of state-of-the-art equipment for computer simulation, computer aided design, and spectrum analyses. Still another is our design and manufacture of the film capacitors used in our filters. Our control of capacitor design and manufacturing helps us achieve the high performance standards of our filter products.

Our filter products are used in most commercial and military aircraft as well as in the NASA Space Shuttle.

ELPAC has earned an outstanding reputation for quality and customer satisfaction.

THE DESIGN AND MANUFACTURING PROCESS

From start to finish, ELPAC's design and manufacturing process provides the highest standards of quality and performance. Here is how we do it:

STEP 1: Understanding the Customer's System

We begin by talking to the customer about system requirements. Typically, we determine the applicable regulatory agencies, size limits for the filters, and the frequency range and insertion loss requirements.

STEP 2: Simulating The Filter

ELPAC analyzes the system requirements and uses computer simulation to design a filter network. This results in a prototype filter design that does the job with the fewest components.

STEP 3: Fabricating The Prototype

Next, ELPAC fabricates the prototype filter. This filter is tested at ELPAC to the customer's system requirements. The process usually involves "fine-tuning" the filter elements to optimize filter performance. This testing takes place in accord with MIL-STD-220, under a quiet EMI environment and with both a 50 ohm source and load impedance.

STEP 4: Customer Testing

The customer now tests the prototype filter. In most cases, the prototype filter meets or exceeds all the system requirements. When the customer's system is dramatically different from the ELPAC testing environment, small design changes may be necessary.

STEP 5: Production Manufacturing

After the customer approves the prototype, the filter is released to ELPAC's manufacturing division. Each step of the filter process is monitored by a computerized MRP system. Manufacture of the filter is accomplished by experienced personnel in accordance with the MIL-I-45208 quality system. As part of this manufacturing cycle, ELPAC provides component certification, in-process and final article source inspection, and 100% electrical testing.

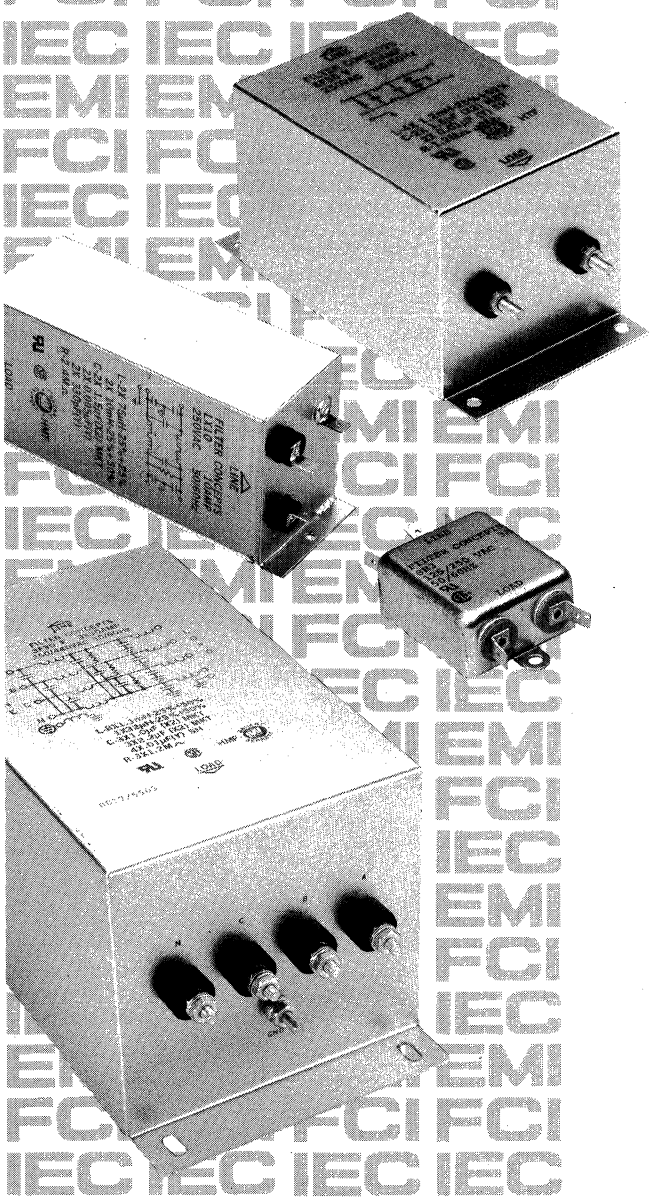
STEP 6: The Customer Takes Delivery

Here is where it all pays off. The toughest part of the job has been completed and the customer can look forward to delivery of the manufactured product. On time! Within the specifications! And at a competitive price!

ELPAC'S CUSTOM SOLUTIONS FOR COMPLEX FILTER APPLICATIONS

A partial list of applications for filter products include:

- ☐ Ground missile control system
- ☐ NASA Space Shuttle
- ☐ Shipboard fire-control system
- ☐ Aircraft power distribution system
- ☐ Avionics communication system
- ☐ Underwater missile control system
- ☐ Land vehicle, high energy discharge system
- ☐ Aircraft data computer
- ☐ Very high temperature, commercial avionics



ELPAC thrives on technical challenge. We regularly tackle the "impossible" jobs. Our 32 year track record proves ELPAC is a name you can trust.
