CIRCUIT

HGN-369

The line filters HGN 369 are used in applications having ON/OFF-switch on front-side but mains input at the rear-side. IEC-connector, voltage-selector for four different voltages, fuse (5 x 20mm or 3 AG optionally) and a highly efficient filter in a totally enclosed metal housing ensure best attenuation, e.g., in instruments, scales, 19'-slide-in-units.

Comments: The FN 370 combi filter line protects electronic equipment from common and differential mode line interference in the range of 150 kHz to 300 Mhz. It is especially suitable for use in equipment intended for world wide export. The voltage selector is designed for two, three or four different voltages. There are also FN 370 filters for medical devices available. The FN 377 and 379 provide higher performance in attenuation.

FEATURES

Power line filter for wideband interference suppression

Comments: The FN 670 series of two stage filters has been designed specifically for use with switch mode power supplies. It has been designed for extremely low leakage current (less than half a milliamp). Therefore, it will not be affected by the high peak current which results from switching power supplies.

Comments: The FN 680 series of two stage high performance filters has been designed specifically to meet the requirements of VDE class B, which extends down to 10 kHz. These filters have no resonances above 20 kHz, and are especially effective against the switching transients which occur from switch mode power supplies.

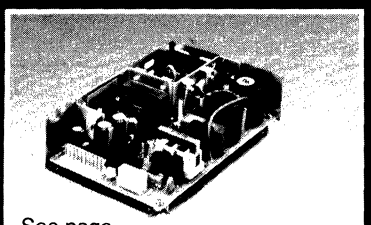
GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with the System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?



The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

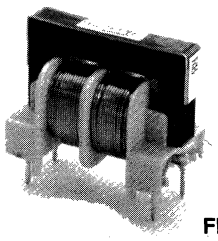
The strength of Tamura's AC and DC power conversion families lies in providing consistently dependable products. All Tamura power and magnetic devices are designed and manufactured to deliver lower AQL levels, guaranteeing you the lowest incoming rejection rates you've ever experienced. For example, last year we shipped over **100 million transformers**– most to customers using a **ship–to–stock** acceptance program.

At Tamura, we're already life testing (not just designing) tomorrow's products– today. Over 100 design engineers at our technology center are dedicated to this task, assuring you of having the most up–to–date technology in your products. Today we are already designing the robotics to build these quality products, in high volume and at low cost. Over 150 product support engineers at 16 Tamura factories see to it.



Satisfy your AC and DC requirements for today and tomorrow. Contact Tamura for your specific requirements.

Tamura quality circles the electron world.

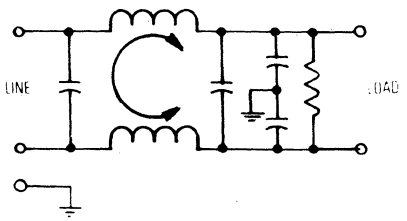
PA/PB SERIES



THE **TRI-MAG** PA/PB SERIES OF A.C. LINE FILTERS HAVE BEEN DEVELOPED PRIMARILY FOR COMPUTER SYSTEMS THAT USE SWITCHING POWER SUPPLIES. THE CURRENT RATINGS ARE HIGH ENOUGH TO ALLOW DESIGNERS TO PROTECT A COMPLETE COMPUTER SYSTEM FROM EXCEEDING THE CONDUCTED EMISSION LIMITS SPECIFIED EITHER BY FCC OR VDE.

THE PA IS AVAILABLE IN CURRENT RATINGS OF 1, 3, 5, 6 AND 10 AMPS AND THE PB IS AVAILABLE IN 1.3 AND 5 AMPS FOR OPERATION ON A.C. LINES OF 115 TO 250 VOLTS 50/60 Hz.

SPECIFY EITHER PA OR PB FOR THE CONDUCTED LIMITS THAT YOU WANT TO MEET.

Part No.	Current	Case	Leakage
PB1	1	2.5 × 2 × 1.5	1mA @ 250VAC
PB3	3	2.5 × 2 × 1.5	1mA @ 250VAC
PB5	5	2.8 × 2.0 × 1.5	1mA @ 250VAC

128 filters in a mainframe

Filters are offered in a wide variety of types that you can mix and match within the 16 card mainframe.

Filters come one, two, four, or eight per card, depending on resolution and other performance features.

2 MHz filters

We have a tradition of leading the way to higher frequency filters. We introduced the industry's first 2 MHz bandwidth filters for programmable use. 80 dB/octave attenuation. Time delay superior to Bessel.

Elliptics as sharp as 130 dB/octave

Precision was first to offer elliptics with 80 dB/octave attenuation. Now we're the first to add the sharper option of 130 dB/octave for frequencies up to 204 kHz.

Passband ripple is 0.044 dB p-p, and there's 1° phase match up to the cut-off frequency.

Open door policy on configuration

You can mix types of filters. You can also add a variety of preamps, post amps, gain ranging amplifiers, and transducer amplifier/filters. Refer to Section 1100 for more details.

A variety of additional system enhancements match the Precision 6000 to your requirements. Frequency-band translators, switch matrices, buffered I/O interface cards and prototype cards are available for your system. See Section 2325 for details.

Easy programming

Set up the system at the front panel. One command uploads the set-up to a host computer. Down-load later to program the system. Choice of serial, GPIB, or parallel computer interfaces.

Precision family of signal conditioners

Call Precision Filters for all your signal conditioning requirements. Signal switching systems, A/D conversion systems, and VXI-based systems are available. See Section 2325.

• See amplifier systems, transducer/amplifier systems, and auto-ranging amplifier systems in Section 1100.
• See other data acquisition systems in Section 2325.

FILTERS 1.0 MHz to 1.0 GHz

Eagle manufactures a wide variety of radio frequency filters. Our goal is to offer a wide variety of standard designs in order to ease the selection process and reduce costs to you the customer. In accordance with this goal the following unique approaches to RF filter manufacure have been taken.

Standard Frequency System-SFS™ Eagle has pioneered this in the filter industry. Basically SFS™ increments are by a fixed percentage. For example standard values would be 1.0 MHz, 1.2 MHz, 1.5 MHz rather then 1.0 , 2.0 , 3.0. As you can see by studying the cutoff frequencies this is identical as standard resistor values. Using this system as few as 46 cutoff frequencies blanket the spectrum from 1.0 MHz to 1.0 GHz. Experience has shown that 95% of the applications can use a standard filter rather than a custom design since a custom frequency can be no more then 5 % away from one of our standard frequencies..

Partially Assembled Module-PAM™ To insure quick delivery and maintain low costs Eagle has developed this concept. In this system the mechanical packages are designed for maximum flexibility both electrically and mechanically. Filter modules are partially assembled for each frequency group and installed into the proper enclosure. When an order is received the unit is trimmed to the final cutoff frequency resulting in a finished filter in days instead of weeks. Standard proven designs spare the customer of the unsurities and cost of custom units. Additionally, there are many standard, and stocked, values for each type of filter which are ready for 48 hour shipment.

Pricing-Eagle has the lowest prices for connectorized filters in low volumes. In 2-4 quantities the HLC700 lowpass filters begin at $95.20 for a standard frequency model. The tuneable filters are as low as $89.10 depending on the frequency range selected.

Due to limitations in space many filter types that are made by EAGLE are not listed here. Please write or call for the complete catalog of Eagle filters and other products.

HLC-700 Lowpass, Highpass, Bandpass and Bandstop Filters

HLC-700 Description:

Eagle HLC-700 series are compact, high performance filters. Stainless steel hardware and connectors assure that there is no corrosion due to galvanic potentials. Cases are solder sealed to keep out dust and foreign materials.

With minimum power ratings of 25 watts, and many models even higher, the spurious free dynamic range of these filters is tremendous. The filters are electrically very rugged, are resistant to ESD and EMP, and may be connected directly to antennas for receiver use or medium power transmitters.

HLC-700's are available in Lowpass, Highpass, Bandpass and Bandstop configurations. Lowpass and Bandpass filters are discussed on the following pages. Please request HLC-700 filter catalog for detailed specifications on Bandpass and Bandstop as well as complete information on Lowpass and Highpass filters.

- **46 Standard cutoff frequencies from 1.0 Mhz to 1000 Mhz**
- **Custom frequencies: $50.00 setup**
- **500 watt and 1000 watt family available**
- **7, 9, 11 or 13 sections**
- **Manufactured to MIL-STDS**

EAGLE HLC700 enhanced chebychev low pass filters are available in four configurations: these are 7, 9, 11 or 13 sections. The enhanced chebyshev design yields a steeper transistion band with no increase in insertion loss. When used as signal filters these units offer excellent immunity from internal intermodulation due to the high power rating.

EAGLE HLC71xB Band pass filters are available from 1.0 to 330 Mhz in standard center frequencies as listed in the specification section. These filters come in standard bandwidths from 2 percent to 20 percent. The table indicates skirt performance of the various bandwidths. Other center frequencies and bandwidths are available as specials. These filters are ideal for IF filtering or other applications where small size and low cost are important.

Specifications:

Electrical Power: 25 watts pass and 10 watts stopband

HDF400 Dielectric filters

These filters offer low insertion loss at a narrow 2% bandwidth.Using four coaxial resonators with dielectric loading to reduce size. Due to the low loss these filters make excellent preselector filters at congested facilities. These units are excellent replacements for cavities in applications where space is at a premium. With a generous 25 watt power rating in the passband, or stopband, the filters may also be utilized to clean up small transmitters.

Specifications:

Electrical: Power: 25 watts pass or stop band.
Return loss: > -14 dB in passband
Mech: Size: 2"x4"x1.75" Weight: <8 Oz

SUPER TIME SAVER!

Do you work with ICs? Do you have trouble finding the IC you need? Are you sick and tired of sifting through dozens of manufacturers' data books? Do you have trouble comparing one set of specs to another? Are you sick and tired of wasting time?

Do we have good news for you! Get your hands on the latest annual copy of the IC Master. The Master will save you both time and money. Here's how.

The Master lists every single IC you can buy. Better yet, the Master lists ICs by function. You know what you want to do. The Master tells you who makes what for what you want to do.

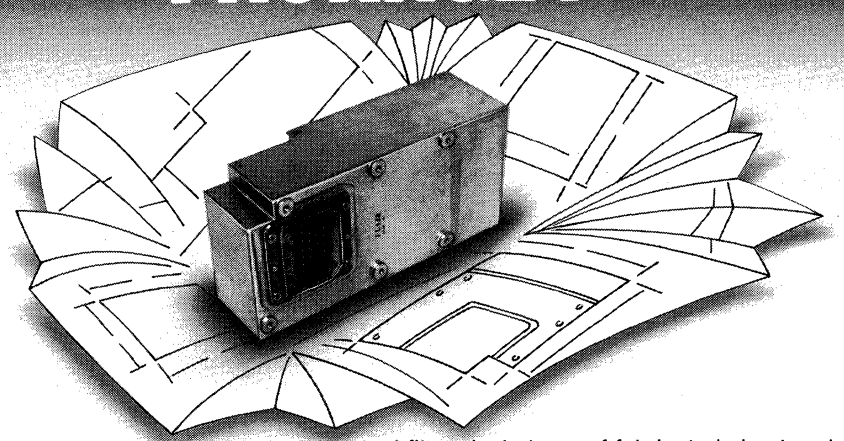
There's more! The Master lists every known alternate source to every integrated circuit. If somebody makes a substitute for an IC, the Master tells you. And fast!

Want to find a custom or semicustom IC? The Master tells you who the manufacturers are, what their capabilities are, and what design tools you need.

Looking for a distributor or a local sales office? The Master tells you where they are. Got a technical problem? The Master tells you who to call. Can't figure out a part number? The Master tells you how the part number systems work.

There's more! The Master has a section on microprocessor development tools with complete performance parameters. There's another section on programmable logic devices giving you everything from output configuration to PLD development systems.

Want to know if there's an application note available on a given part? The Master tells you!



If your question has anything to do with integrated circuits, you need the IC Master. Subscribe now by calling (516) 227-1314. Ask for Marie Botta. Tell Marie you need the Master now.

If you prefer, write to Marie, Hearst Business Communications, 645 Stewart Ave., Garden City, NY 11530. She'll mail you the IC Master subscription form right away.

And, if you tell her you saw it in the 1991/92 EEM, she'll take $10 off the subscription price!

Digitally Programmable 8-Pole Active Filters

Complete with Internal Solid State Switches

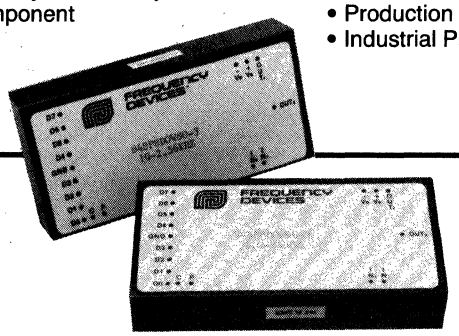
848 and 878 Series—Lowpass and Highpass

A Design and Application Breakthrough

General Description

The 848 and 878 Series are digitally-programmable lowpass and highpass active filters that are tunable over a 256:1 frequency range. These units contain 8 bits CMOS clocked "D" latches which can be digitally configured to operate in any of three modes: Each unit is available with any single factory-set tuning range listed below:

- 1 Versions: 0.1 Hz to 25.6 Hz
- 2 Versions: 1.0 Hz to 256 Hz
- 3 Versions: 10 Hz to 2560 Hz
- 4 Versions: 100 Hz to 25.6 kHz
- 5 Versions: 200 Hz to 51.2 kHz



All 848/878 Series models are fully finished filters which require no external components or adjustments, and operate from non-critical ±12 to Ω18V power supplies. A 20 kΩ input impedance and a 10Ω (max.) output impedance make these compact (2.0″W × 4.0″L footprint, by 0.75″ or 1.0″H) encapsulated plug-in modules convenient and easy to use.

ICMASD...IC Alternate Source Directory

The all new 1991 version of the world famous Alternate Source Directory is now available in floppy disk form for your IBM XT & AT and 100% compatible personal computer with hard drive.

The **1991 ICMASD** contains the more than 180,000 listings that appear in the Alternate Source Directory Section contained in Volume Two of the printed version of the 1991 IC Master ...plus additional discontinued parts. The database includes complete vendor addresses and phone numbers.

You can personalize the **ICMASD** for your application. The program allows you to add comments, up to 20 digits long, to each listing. These comments can be part numbers, prices, or any information specific to your needs. You may also add, delete and/or discontinue devices!

For greater flexibility the base number search feature enables you to access parts by base number, i.e., the device number stripped of prefixes and suffixes. You don't need to know the manufactures codes to call up any of the alternates to these devices.

The **1991 ICMASD** is fast, convenient and very user friendly!

Complete program documentation is included. When ordering, be sure to specify if you want the **1991 ICMASD** on three, double-sided, double-density disks OR on one high-density disk.

For immediate delivery you can order the **1991 ICMASD** at $179.50* simply by charging your Visa or MasterCard credit card. To place your order or for more information, call or write:

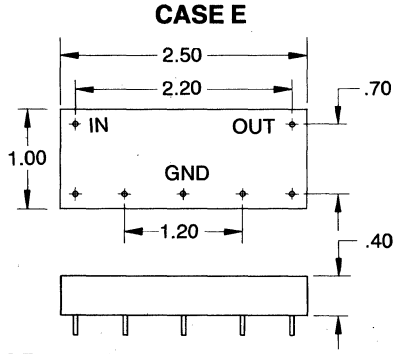
ATTENUATION vs. FREQUENCY

PASSBAND GROUP DELAY

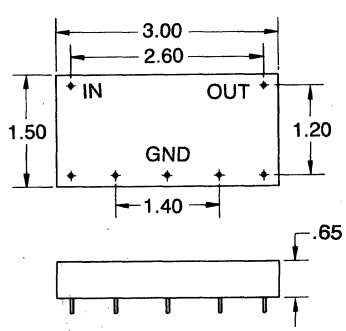
PASSBAND ATTENUATION

Designed and manufactured to meet the stringent requirements of video analog and digital systems, KR Electronics' group delay equalized lowpass filters are optimized for performance and size.



The three primary criteria for video applications are sharp transition, constant group delay and flat passband. The graphs at the left illustrate the typical response of a MDV8B500 filter. The filter makes a transition from the end of the passband to >45 dB at a shape factor of 1.4. To practically eliminate phase distortion, group delay equalizers are used to achieve constant group delay (< ± 10 nsec) over the entire passband. These filters also exhibit flat amplitude response (< ± .1 dB) up to the cutoff frequency. This performance is available in a miniature, low profile, PC board mountable package.

These filters are ideally suited for anti-aliasing in A/D and D/A applications. Various levels of attenuation are available for different resolutions. For filters used after D/A conversion, Sin(X)/X shaping of the passband is available.



KR Electronics has a strong background in custom design and manufacture. This gives you the flexibility to specify the frequency, shape factor and package configuration that meet your particular requirement.

RF/Microwave Filters In A Hurry For Customers In Trouble

Tunable Notch Filters 22 - 900 MHz

For suppression of interference to electronic systems:

•VHF/UHF Systems •Broadband LAN •Mobile Radio •Paging •CATV •FM •TV

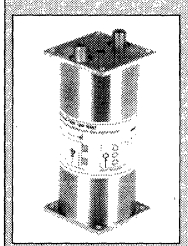
The 6367 series comprises 6 separate tunable notch filters, each of which covers an approximately 2:1 frequency range with adjustable 3 dB bandwidth.

In CATV, LAN or other Broadband Data Systems, adjacent channel or FM carriers often interfere with reception of a desired channel or data frequency. The notches offer a convenient means of suppression.

Paging Transmitters often overload CATV and other off air reception systems. The exact frequency is often unknown to the offended party. These filters offer a convenient means of "search and suppress."

intermodulation in their front end, due to reception of a strong, unwanted carrier. These filters offer "front end" insurance against such intermodulation or desensitization.

Laboratory applications include suppressing discrete, unwanted carriers to increase the accuracy of spectrum noise measurements.



Standard models delivered in 3 days.

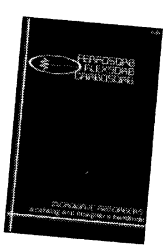
FERROSORB™ is used to fabricate terminations, attenuators or spurious energy suppressors 1-26 GHz by casting or machining:

RIGID, machinable stock comes in plates, rods and square or rectangular bars.

FERROFLOW™ and CARBOFLOW™ are two part casting systems to produce rigid magnetic and non-magnetic parts. Two part system FLEXFLOW™ produces flexible parts such as gaskets for double duty: sealing against moisture and RF leakage.

FREE design handbook and catalog F/81 describes these materials in detail: physical properties to machine and cast them - including mold design.

Also described is a standard line of low VSWR terminating inserts for rectangular waveguide WR42 - WR284 and circular waveguide 0.375" - 3.00" diameter.



The design section shows how to design low VSWR coax/waveguide loads, including sliding elements for calibration, elements for variable coax and waveguide attenuators, coaxial amplitude compensators, waveguide absorptive harmonic filters and spurious energy absorbers for cavities, probes and filters.

Our ability to custom design-build-test new absorbers from your "Black Box" specs is illustrated with a variety of special parts from our 23 years of designing microwave components and equipment for defense and industry.

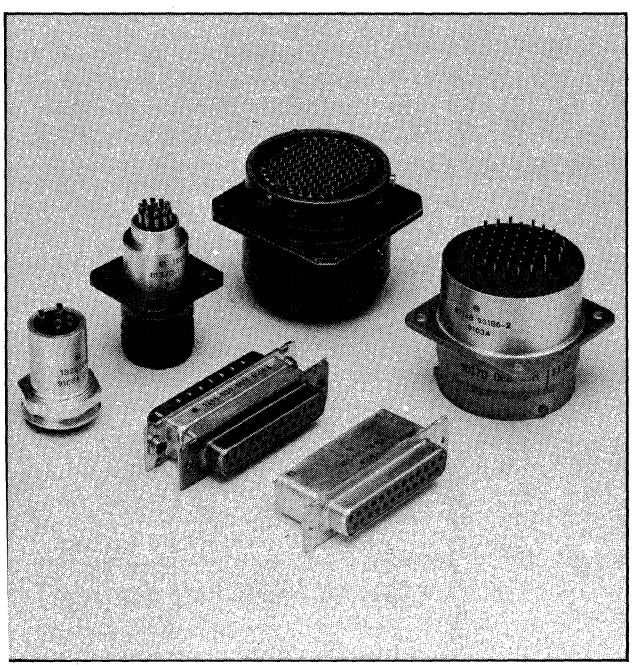
CUSTOM DESIGNED FILTER NETWORKS AND ARRAYS

MURATA ERIE NORTH AMERICA



Murata Erie specializes in developing sophisticated circuit designs and creating high component density packaged networks and arrays. And Murata Erie does it all...in-house. Our engineering design teams analyze individual customer problems, design specific components or networks to solve the problem, build prototypes and test the complete system.

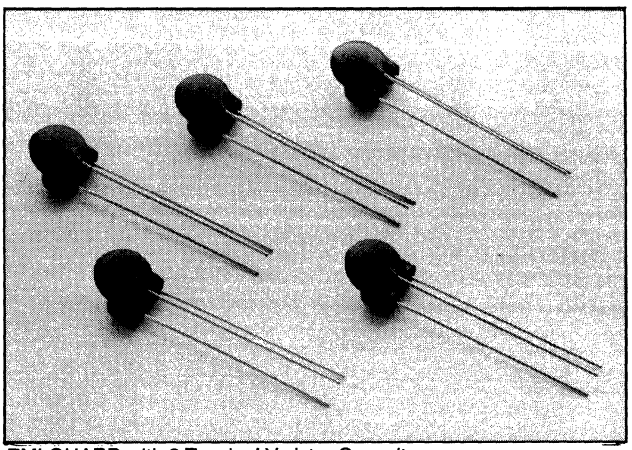
To support the high technological content of these custom networks, the engineering and test capabilities at the Murata Erie facility have become one of the most advanced in the industry today. The reliability of every component and network is assured by a comprehensive battery of tests performed under carefully controlled conditions. Then, in-line prototype techniques further validate component performance prior to volume production.

These technical support activities permit Murata Erie to respond to customer needs promptly and efficiently with positive performance engineered into the customer's system. If your requirements are unique, if you have a critical space, weight or environmental problem, Murata Erie can help solve your specific requirements for you with a custom designed filter network.

FILTERED CONNECTORS

Murata Erie does not usually manufacture the connector itself but procures a fully qualified connector and adds the filter elements to it. This "Piggy-Back" construction offers the best of two worlds, a connector manufactured by experts in their field and filters manufactured by Murata Erie who are also experts in their field, a tough combination to beat.

Murata Erie's mechanical and electrical engineering teams have developed this product line with two main goals in mind. First to offer you a package that is as electrically efficient as possible and secondly to environmentally protect this package by completely encapsulating it in a specially formulated epoxy, developed and tested over many years.



Murata Erie achieves its first goal of electrical efficiency by soldering every junction between all active components. This results in the absolute best grounding technique available to you. Just as one would not rely on a capacitor mounted on a P.C. Board by mechanical means to maintain its electrical integrity in a critical circuit, we, at Murata Erie, do not rely on mechanical grounding as others do to provide the various insertion loss characteristics required. The solder construction and complete encapsulation results in a filter connector that is more than capable of withstanding the many complex electrical and environmental requirements that have become commonplace in our sophisticated electrical society.

Filter connectors are available to meet the following MIL specifications: MIL-C-5015 MIL-C-83723 MIL-C-26482 MIL-C-38999

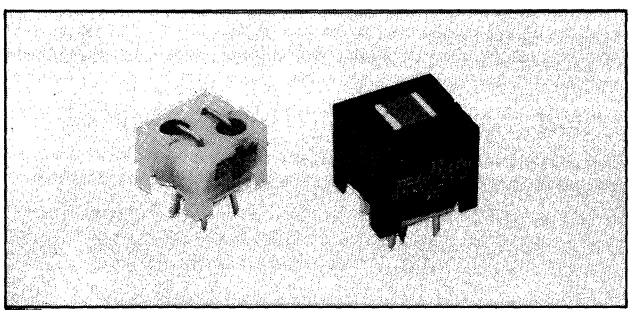
EMI/RFI SUPPRESSION FILTERS

MURATA ERIE NORTH AMERICA

EMI-GUARD with 3 Terminal Varistor-Capacitor



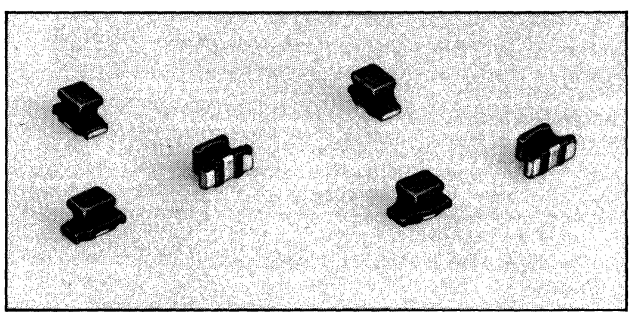
EMI-GUARD DSS710 D 223S 12-22

The DSS710 EMI-GUARD uses a new capacitor element which provides the varistor function. THis varistor-capacitor not only works as a bypass capacitor but also lets most high-voltage surges flow to ground.

The varistor-capacitor used in the DSS710 EMI-GUARD has a 3-terminal structure so that its high frequency functions are substantially better than those of conventional capacitors. Furthermore, it is combined with ferrite beads to form a T-type filter circuit that more effectively dampens noise.

The DSS710 EMI-GUARD efficiently removes quick-rising surges and high-frequency noise above 50 or 60 MHz which conventional capacitors and varistor-capacitors are incapable of removing.

Varistor capacitors are used even where EMI filters fail. They are self-healing and effective in circuits having 500-600V impulses.

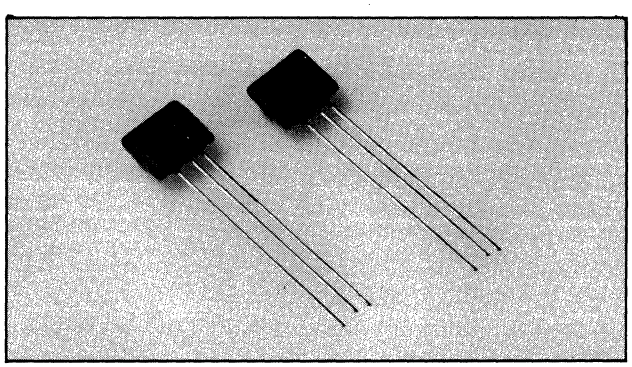


BNX [for DC power supply]

BLOCK TYPE EMIFIL®, BNP/BNX SERIES

Murata Erie's new block type EMIFIL BNP/BNX Series completely eliminates noise from extremely wide frequency bands. The BNX is perfect for use in DC power circuits, while the BNP is ideal for eliminating noise in logic signal circuits. Both are designed to perform superbly—the result of Murata Erie's wide expertise in the fields of through-type barrier layer capacitors, monolithic chip capacitors and bead inductors.

Each block contains a number of compact EMI-suppression filters. In addition, the input/output terminals and the grounding terminal are aligned in the same direction, thus permitting fast and easy assembly on any type of P.C. board.



SURFACE MOUNT CHIP FILTERS, NFM52 SERIES

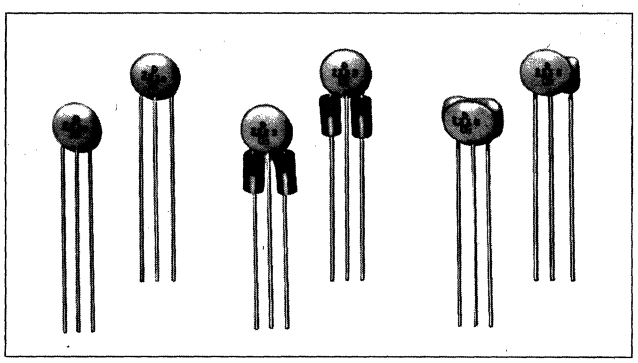
The NFM52R Series chip is an efficient signal line noise suppression filter for high-speed digital signal lines where base-band frequencies and noise band frequencies are very close.

Murata Erie has combined its superior ceramic technologies with a unique circuit configuration to realize outstanding noise suppression effect in these applications. The NFM52R Series assures noise reduction to meet the specifications of CISPR, FCC, etc.

APPLICATIONS

Noise suppression for compact digital instruments, laptop personal computers, HDTV, EDTV, portable VTR, etc.

SIGNAL LINE NOISE FILTER, NFV610 SERIES



This new high performance noise suppression filter utilizes a unique circuit design and a total components concept to provide exception performance in high speed, high impedance digital signal lines. It uses considerably more components than previously available filters so that the high input and output impedances of digital IC's can be matched. This impedance matching greatly reduces the waveform distortions, created by reflections and ringing, that are apparent with convention filters.

The NFV610 Series of noise suppression filters meets all applicable specifications of the FCC, CISPR, etc.

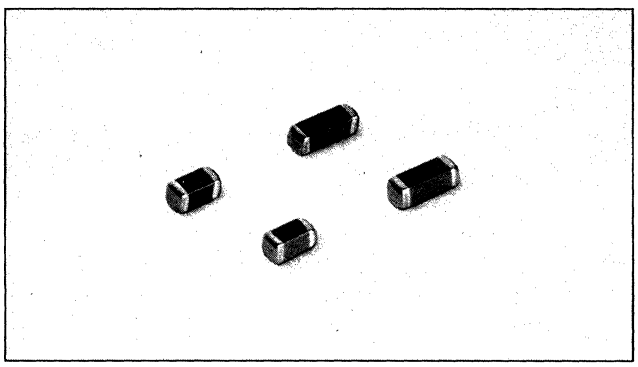
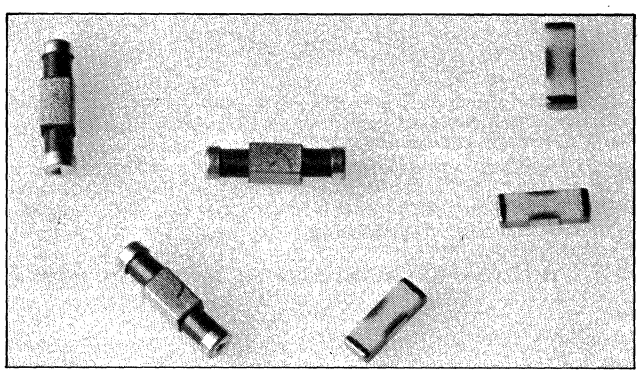
EMI/RFI suppression filters



MURATA ERIE NORTH AMERICA

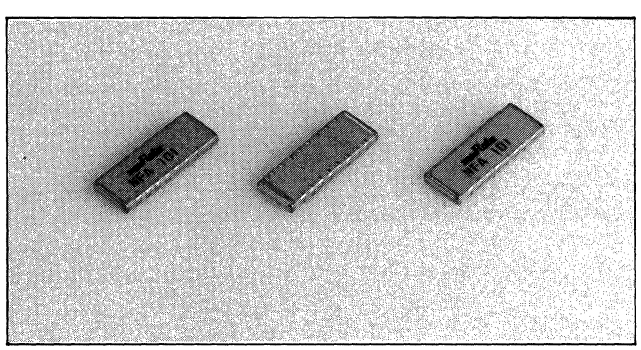
Disc-Type for PCB Mounting



The three terminal takes advantages of lead inductance and is actually a T type filter when compared to a normal two leaded disk capacitor. The advantage is that the inherent resonance is shifted up in frequency while at the same time the attenuation above the resonant point is improved because of the inductive elements.

These parts are available with or without ferrite beads on the two outside leads which further improves the insertion loss. They are ideally suited to both DC powerline filtering and signal line filtering particularly at I/O ports.

Surface Mount Ferrite Chips



The BLM series of ferrites provides a large range of attenuation from 70 Ohms at 100 MHz to 600 Ohms at 100 MHz due to a unique internal construction. This coil like, multilayer ferrite bead is an inexpensive and effective way to attenuating noise on signal and DC powerlines without introducing any capacitance.

Surface Mount Filters

The first series of SMT filters is a three terminal chip cap, essentially a feedthru capacitor whereas the second is a three terminal T filter which has ferrites on each end of it and the third is a PI filter configuration.

The capacitive only filter, NFM41 series, is designed for low current 300mA signal line applications. The T series, NFM61R, is more suited to DC Powerline filtering because of the higher current rating of 2 amps and the T configuration which is more suited to low impedance circuits. The PI network is designed for high speed digital and video line filtering and has four specific cutoff frequencies of 10, 20, 50 and 100 MHz.

Surface Mount Filter Arrays

The NFA is similar to the NFM41 described above except that eight feedthru capacitors are built in one slab of ceramic and the BLA is a similar part except that it is ferrite. By utilizing these two components, the design engineer has the flexability of building the type of filtering circuit required by the application. These components are ideally suited to I/O filtering particularly when placed near an output connector.

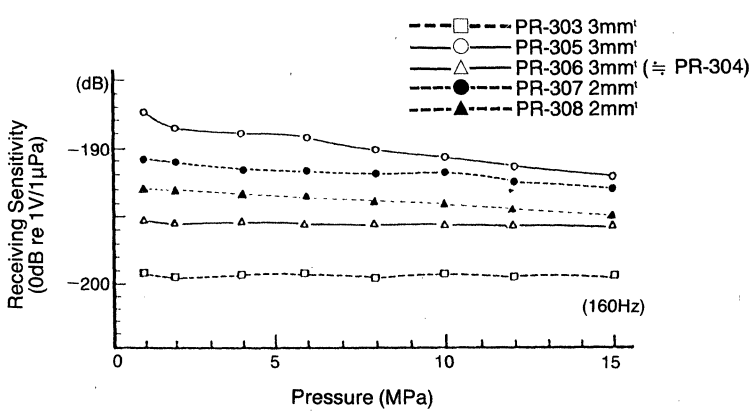
PIEZO-RUBBER

Piezoelectric flexible composites (**NTK** Piezo-Rubber) have been developed at **NTK-NGK.**
The features of **NTK** Piezo-Rubber are as follows.



- **Flexible** not brittle.
- **Easily workable.** Can be cut easily with knife.
- **Large area sensor and laminated thick sensor**
  We can produce the Piezo-Rubber over a few hundred millimeter square and up to five millimeter thickness.
- **Large damping and flat frequency characteristics**
  Receiving waveform has high fidelity and it is used at frequency of 10 ~ 5MHz.
- **Acoustic impedance close to value of water**
  Acoustic impedance of Piezo-Rubber is about 8×10^6 Ns/m^3.

PRECISION FILTERS

A growing selection of filters

Precise programmable filters are offered in a wide variety of types that you can mix and match within the 16 card capacity of the Precision 6000 mainframe. Filters come one, two, four or eight channels per card, depending on resolution and other performance features.

Custom systems at off-the-shelf prices

Not only can you mix various types of filters, you can also add a variety of preamps, post-amps, gain-ranging amps, and transducer amps (see Section 1100), as well as other signal conditioning devices such as frequency-band translators and switch matrices (see Section 2325).

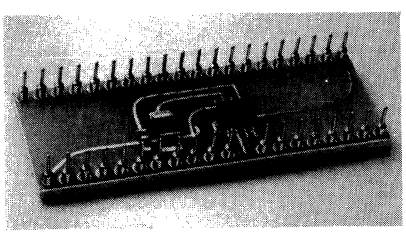
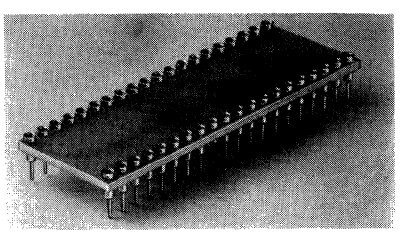
CORRECT-A-CHIP™

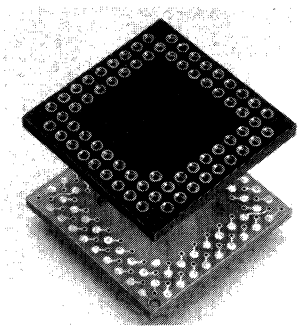
Enhanced Sockets/Hybrid Sockets



with bifurcated pins

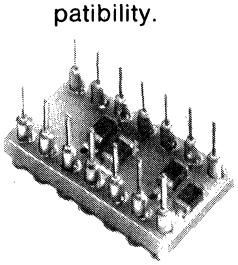


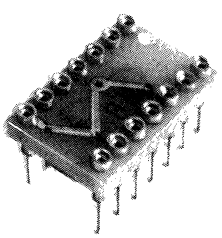
with collet pins



Circuit paths can be re-routed using the Aries Correct-A-Chip technology. The miniature printed circuit board inside the Correct-A-Chip provides circuit paths making the desired electrical connections and has high reliability collet contacts to accept devices and solder tail contacts for board insertion. Correct-A-Chip technology solves problems such as the need to use alternate IC's (availability, obsolescence or better performance, etc.) thus eliminating the need for new p.c. boards, jumper wires, cut traces or other alternatives. Full utilization of Correct-A-Chip technology may also incorporate both surface mount active and passive devices thus using available real estate to maximum advantage. The Correct-A-Chip is available with stamped pin or high reliability collet sockets.

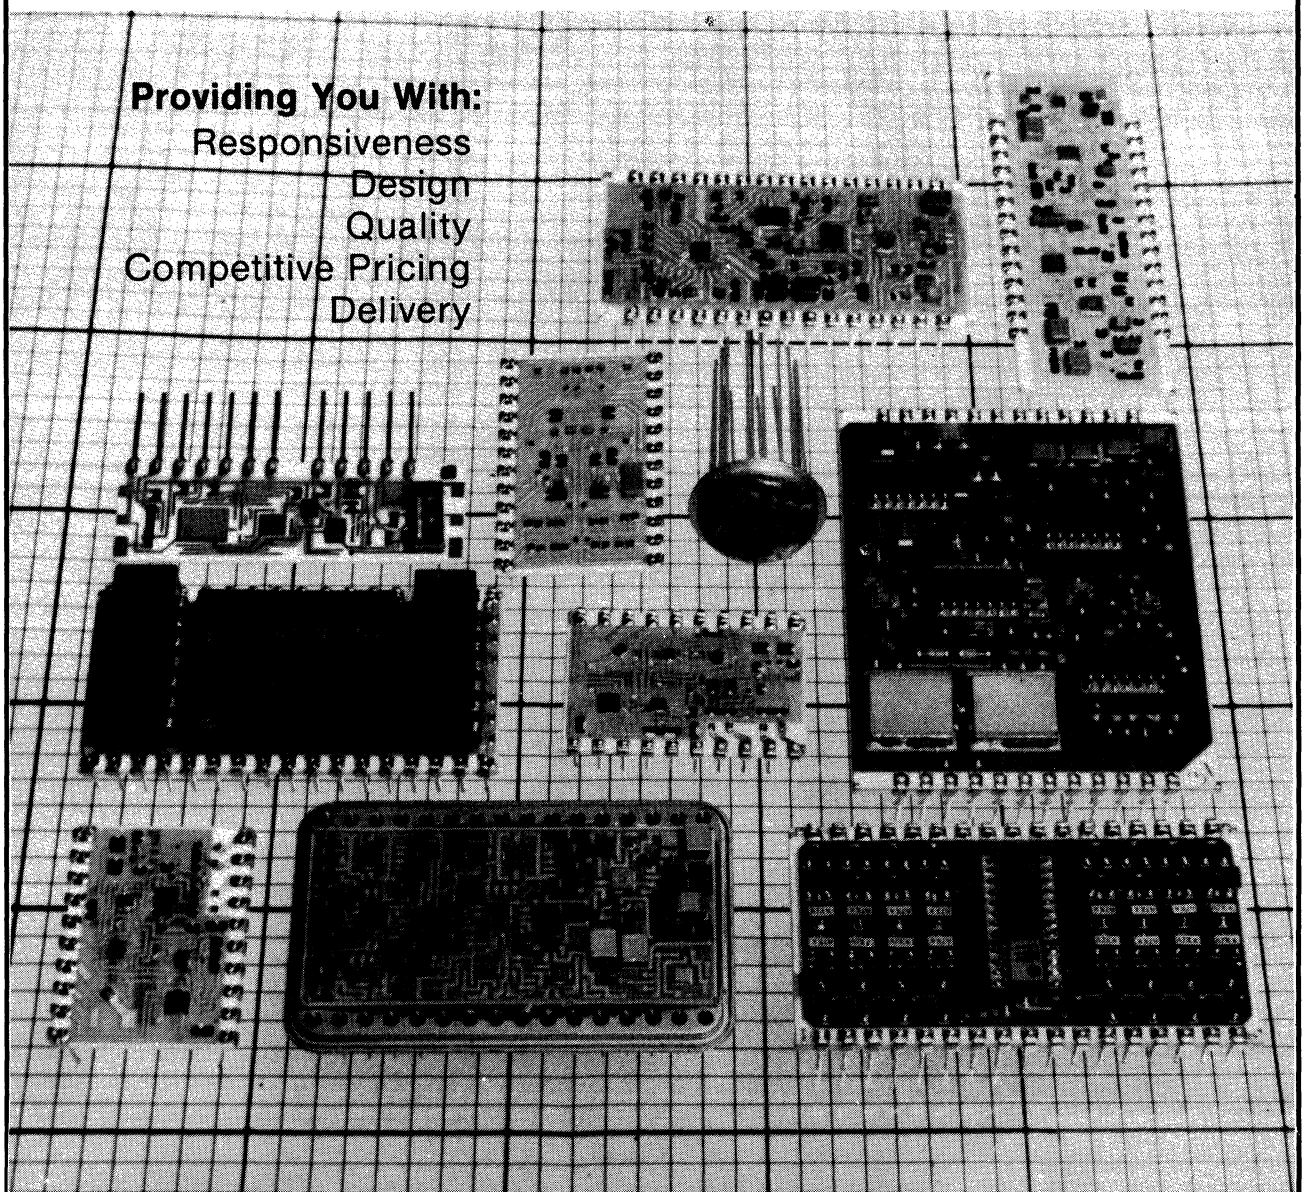
CORRECT-A-CHIP Specials





This special is a 40 pin collet socket, with a surface mount 7705 integrated circuit plus two surface mount resistors plus two capacitors all mounted on the socket. The effect of all this is that the socket becomes a hybrid, which is actually a reset monitor which constantly checks to make sure there is a minimum voltage to the microprocessor that will be plugged into the 40 pin socket. Although this was a special, designed for a specific application, it is quite possible that another customer may need to do the exact same thing. The Aries part number for this is 1107939.

Pin Grid Array Adaptors using the Correct-A-Chip technology are solving many problems of IC pin/out incompatibility.



High-Voltage Transient Protection is incorporated into this special Aries Correct-A-Chip. DIP and SIP sockets easily lend themselves to this technology incorporating surface mount devices. In the sample shown transient suppressors have been surface mounted to protect 1488 or 89 IC from high voltage blow-out. The new Correct-A-Chip socket is retrofitable after a blow-out has occurred thus preventing future loss of 1488 or 89 IC's.

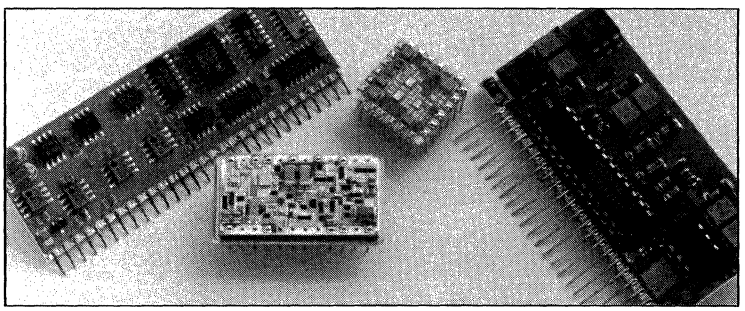
HEI Custom Hybrid Design and Production Services

HEI is experienced in the design and manufacture of custom design-disclosed hybrid circuits for a variety of electronic applications. The company has been a supplier of custom hybrids for 20 years, producing circuits for many electronic applications. Capabilities include multiple layer designs, double-sided through-hole processes, flip-chip, chip and wire and surface mount processes.

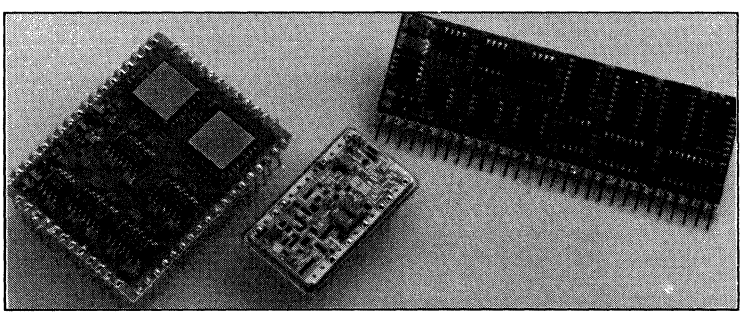
The company specializes in the design of ultra-miniature outlines, having produced some of the smallest hybrids in the industry. HEI services include preliminary application cost analysis, prototype development and final production. Finished parts are 100-percent functionally tested - guaranteed to meet or exceed the customer's specification.

Thick film hybrid circuits offer several important advantages to the electronics designer. These include greater circuit density than conventional circuit boards, improved heat dissipation, and fast development time.



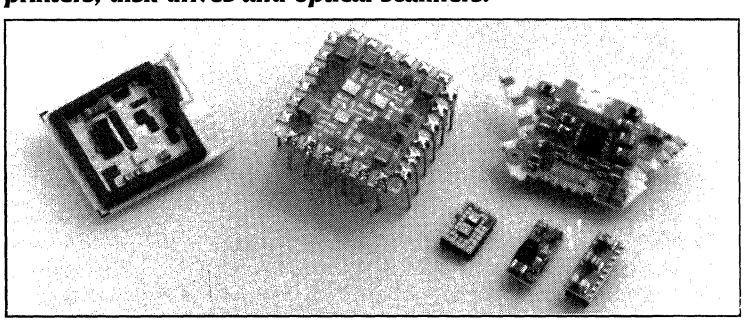
Hybrid construction offers some of the size reduction and performance efficiencies of ASIC's without large NRE, and without need for high volume production. Unlike ASIC's, hybrids do not require complex and costly micro-design work.

The reduced size of hybrids complements circuit performance because of shorter signal paths and lessened potential for stray capacitance and cumulative inductance. Low-profile, low-mass hybrids withstand higher G forces and vibration levels than conventional circuits.



Alumina ceramic hybrid substrate material combines high thermal conductivity with low thermal coefficient of expansion. Since all components are mounted to a common thermal plane, temperature variation between components is reduced.

Hybrids may be adjusted under load by means of laser trimming of capacitive and resistive elements in order to meet very closely-specified tolerances.



HEI hybrids can be made in multi-layer, double-sided and through-hole formats, with chip and wire-bonded IC's or surface-mounted devices.

Hybrid analog and digital circuits for industrial equipment such as analog controls, pressure sensors, signal amplifiers and optical sensors

Digital hybrid circuits used in computer peripherals such as printers, disk drives and optical scanners.

Miniature hybrid amplifiers and control circuits used for medical equipment such as hearing aid amplifiers, intravenous drip sensors, ultrasound imaging, blood sensors and nerve stimulators.

MINIGLOSSARY THYRISTORS/ HIGH POWER DIODES

THYRISTORS

A thyristor is a four-layer semiconductor (pnpn) that can be switched from an OFF to an ON state. This is usually done by a voltage or current pulse to the gate terminal. The device will then continue to conduct so long as the principal current of the device flows through the thyristor's two main terminals.

In many respects a thyristor is analogous to an electromechanical latching relay. In fact, thyristors have largely replaced these relays in newer equipment designs. But, misapplications and/or failure to fully understand the parameters of these and other solid state devices often leads to catastrophic field failures.

The terminology shown on this page has been condensed from common industry data books and is intended to be a guide for the engineer.

di/dt: *Critical rate of rise of ON state current* is the user's maximum design limit (Fig. 1).

di_R/dt: *Rate of decay of ON state current* (Fig. 1 & 2).

dv/dt (critical): *Rate of rise of OFF state voltage*. Lowest voltage rate of rise to cause a thyristor to turn ON.

dv/dt (reapplied) : *Rate of rise of reapplied OFF state voltage.*

I_{FSM}: *Nonrepetitive ON state surge current in diodes.* Maximum peak value of ½ cycles (60 Hz) a diode can withstand up to 100 times in its lifetime.

I_{TSM}: *Nonrepetitive ON state surge current in thyristors*. Maximum peak value of 60 Hz cycles a thyristor can withstand up to 100 times in its lifetime.

I_{DRM}/I_{RRM}: *Maximum peak forward/ reverse leakage current* at specified temperature and repetitive conditions.

I_{GDM}: *Continuous gate current not to trigger*. Highest dc gate current that will *not* cause thyristor to switch from OFF to ON at a specific temperature.

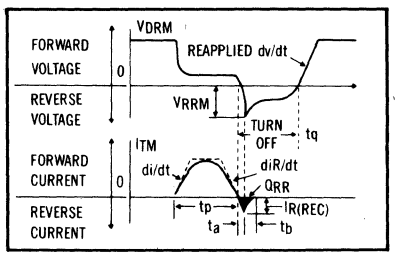

Fig. 1. Concurrent voltage and current waveforms

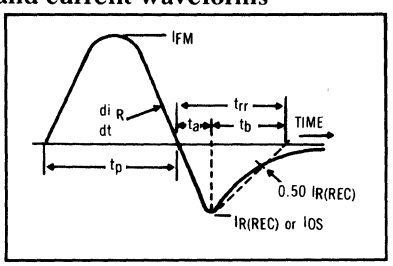

Fig. 2. Recovery current waveform

I_{GT}: *Continuous gate trigger current.* Absolute minimum gate current required to switch thyristor from OFF to ON.

I_H: *Holding Current*. Minimum current required to hold thyristor ON.

I_L: *Latching current*. Minimum current required to hold thyristor ON after removal of gate drive.

$I_{(REC)}$; *Recovery current*. Peak value of reverse current during recovery or turn OFF (Fig. 1 & 2).

I_{OS}: *Overshoot current*. See $I_{R(REC)}$.

I^2t: Maximum ON state, short time thermal capacity of the silicon element for operations less than ½ cycle of 180° conduction angle.

$I_{T(AV)}$: *Average ON state current* (max.)

Q_{RR}: *Reverse recovered charge* (Fig. 1).

$R_{\theta JC}$: *Junction-to-case thermal resistance* in degrees C per watt.

$T_{C(MAX)}$: *Max. allowable case temperature.*

$T_{J(MAX)}$: *Maximum allowable junction temp.*

t_d: *Delay time*. Interval between a specified point at beginning of gate pulse and the instant at which the principal voltage drops to a specified value. (OFF-ON) (Fig. 3)

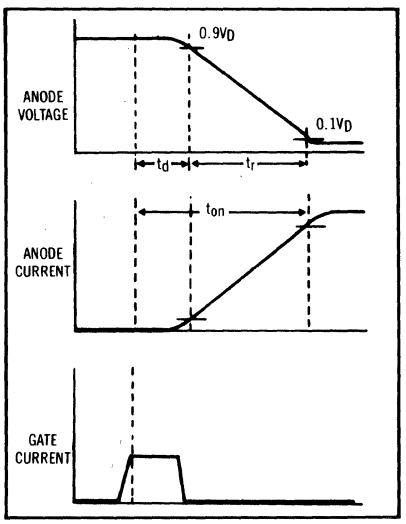

Fig. 3. Turn-on time waveforms

t_{on}: *Turn-on time*. The sum of delay time and rise time. (OFF-ON) (Fig. 3)

t_q: *Turn-off time.* Time between principal current reaching zero and the instant thyristor can block forward voltage without turning ON. (Fig. 1)

t_r: *Rise time*. Time between principal voltage dropping from one value to a second lower value when thyristor turns from OFF to ON. (Fig. 3)

t_{rr}: *Reverse recovery time*. (Fig. 2)

V_{DRM}/V_{RRM}: *Maximum repetitive peak OFF state/reverse voltage* excluding non-repetitive transients.

V_{DSM}/V_{RSM}: *Maximum nonrepetitive peak OFF state/reverse voltage.*

V_{FM}/V_{TM}: *Maximum forward voltage drop* at a specific forward current and case temp.

V_{GDM}: *Gate nontrigger voltage*. Highest dc voltage that will *not* cause thyristor to switch from OFF to ON.

V_{LATCH}: *Latching voltage*. Voltage required for thyristor to latch ON at a given gate current and junction temp.

$V_{TM(DYN)}$: *Dynamic ON state voltage*. Transient ON state voltage of thyristor when triggered into conduction for a given load and time.

CUSTOM THICK-FILM HYBRIDS

interpoint

MIL-STD-1772 Qualified

R E L I A B I L I T Y

20 Years of Hi-Rel Expertise

Interpoint Corporation is the premier world-wide supplier of thick-film hybrids for high reliability electronic applications. For over two decades it has proven itself by building custom microcircuits for the most demanding applications—commercial and military aircraft, computers, medical electronics, missile systems, satellite payloads.

Interpoint is a dedicated hybrid manufacturer—our entire corporate mission is design and production of superior microcircuits. Founded in 1969 as Integrated Circuits Incorporated, Interpoint was one of the first suppliers to offer full certification and qualification to the highest quality standards under MIL-STD-1772—and one of the first to implement Statistical Process Controls and Computer Integrated Manufacturing.

The Choice Is Yours

Interpoint offers the system designer more choices than any other microcircuit manufacturer.

- Choose domestic manufacturing in our MIL-STD-1772, 50,000 square foot Redmond Washington plant. Or pick cost effective off-shore production in our 40,000 square foot, military quality facility in Taiwan.
- Select test standards—up to full MIL-STD-883C test procedures are available in-house as well as custom screening to your own specifications.
- Choose package styles, from full hermetic welded cases to cost effective ceramic and plastic potted styles.
- Select the delivery system—large or small orders, inventory stock or just-in-time.

In programs that need the highest levels of reliability, Interpoint hybrids are the first choice. Interpoint hybrids are used on virtually every airliner in the West, the most advanced fighter aircraft, in medical electronics, computers, and industrial controls.

Short Lead Times

Interpoint has become one of the acknowledged industry leaders in applying systems management techniques to the hybrid process—from initial design and analysis through production and final test. This expertise means high reliability, fast turn-around, and precision engineering for each circuit.

Interpoint can produce a prototype of your circuit in as little as 8 to 12 weeks.

PROVEN RELIABILITY: WITH THE INDUSTRY'S WIDEST CHOICE OF DOMESTIC AND INTERNATIONAL MANUFACTURE.

A Single World-wide Quality Standard

Interpoint is the only thick-film hybrid supplier to provide both the highest standards of quality and a choice between domestic and international production.

Our US facility is fully qualified under MIL-STD-1772 and the company is listed in MIL-M-38510G's Qualified Manufacturer's List (QML).

We apply the same quality standards —the same source controls and process requirements—to our Interpoint manufacturing facility in Kaohsuing, Taiwan. This facility has been audited and approved for military program level production by some of the largest suppliers of Hi-Rel electronics.

Interpoint offers a complete in-house screening capability that includes full compliance with MIL-STD-883C method 5008. Screening includes electrical test over temperature; visual inspection; gross and fine leak tests; stabilization bake; temperature cycling, constant acceleration, and burn-in.

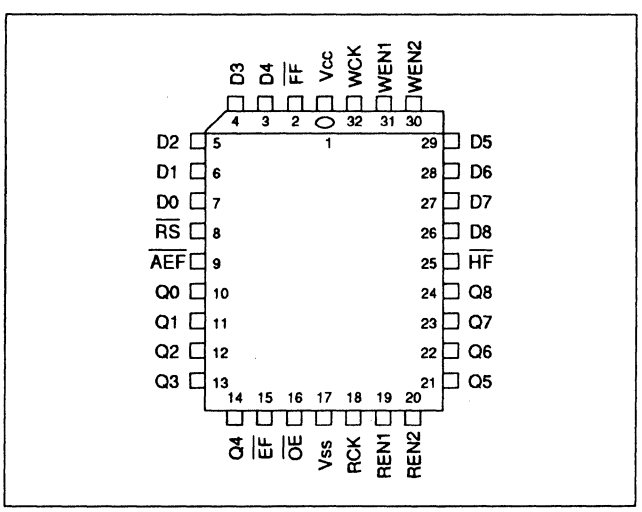
LH5492
4k × 9 CLOCKED FIFO

FUNCTIONAL DESCRIPTION

The LH5492 is a 4k x 9 bit dual-port memory with internal addressing to implement a First-In-First-Out Algorithm. One port is dedicated to write operations, and the other is dedicated to read operations. Two edge-sampled enable inputs are provided for each port. These read and write controls are designed to interface to continuously clocked synchronous systems, but the independent read and write clocks may be operated completely asynchronously relative to each other. Data flow is initiated on the rising edge of the appropriate clock signal, and gated only by the corresponding enable control inputs.



A broad range of status flags monitor the extent to which data has been written into the FIFO. These include Empty, Half, Almost Empty/Full (within eight of Empty or Full), and Full status flags. These flags may be tied directly enabling the inputs to prevent overrun of FIFO boundaries. Alternately, enabling read/write operations may be controlled entirely by external system logic, while the flags serve as system interrupts. This approach is particularly useful when the relation between read and write clocks is asynchronous.

A level-sensitive output-enable input provides high impedance output capability for interface to shared system buses. This output-enable function along with the multiple read and write enable inputs allows for simplified implementation of bidirectional FIFO interfaces, as well as interfaces between system buses of different word widths.

FEATURES

LH5420
256 × 36 × 2 BIDIRECTIONAL FIFO

FUNCTIONAL DESCRIPTION

The LH5420 contains two FIFO buffers which operate in parallel but opposite directions for bidirectional data buffering. The two FIFO buffers are each organized as 256 words by 36 bits. The LH5420 is ideal for either wide unidirectional or bidirectional data applications, since component count and board area is reduced.

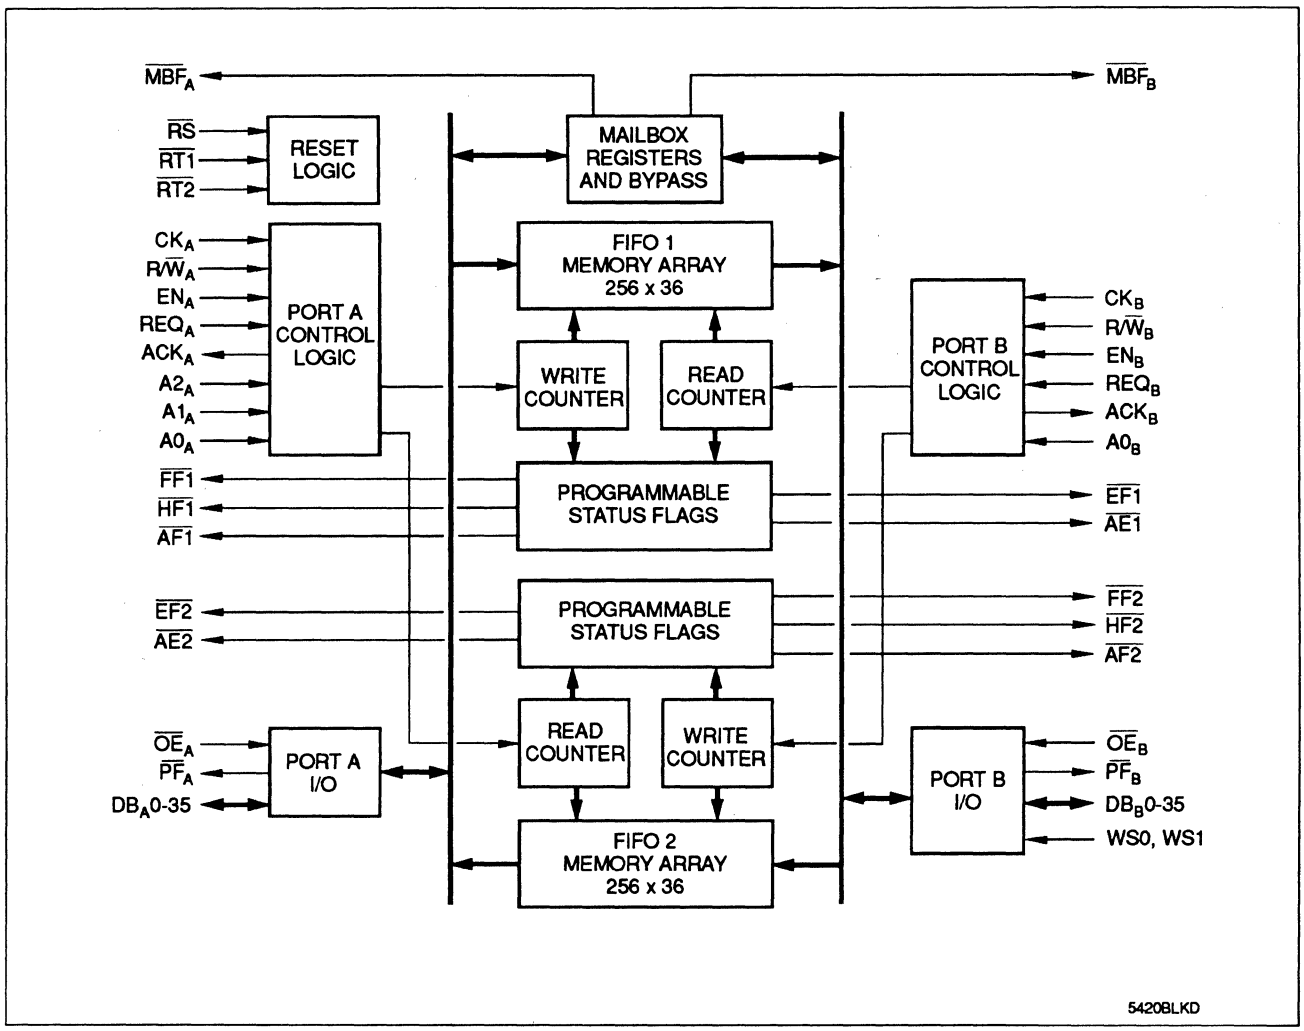
Each port has its own port-synchronous clock, but the two ports may operate asynchronously relative to each other. Data flow is initiated on a port by the rising edge of the appropriate clock and gated by the corresponding edge sampled enable and read/write control signals. Clock duty cycles can vary from 40% to 60% without sacrificing performance.

FIFO status flags monitor the extent to which the FIFO buffers have been filled. These include Empty, Almost Empty, Half Full, Almost Full, and Full flags for each FIFO. The Almost Empty and Almost Full flags are programmable over the entire FIFO depth, but are conveniently initialized to 8 locations from the respective boundaries at reset.

A synchronous request acknowledge handshake is provided on each port for FIFO data accesses. This request-acknowledge handshake resolves FIFO full and empty boundary conditions, when the two ports are operated asynchronously relative to each other.

Two mailbox registers provide a separate path for passing control or status words between ports. Each mailbox has a flag which is synchronized to the reading port's clock. This mailbox function can facilitate the synchronization of data transfers between asynchronous systems.

A Data Bypass mode allows Port-A to directly transfer data to or from Port-B at reset. In this mode the device acts as a registered transceiver under Port-A control. For instance, a master processor on Port-A can use the Data Bypass feature to pass initialization or configuration information directly to or from a peripheral device on Port-B during a system start-up.



A word width select option is provided on Port B for 9 bit, 18 bit, or 36 bit data accesses. This allows word width matching between Port A and Port B with no additional logic; and ensures maximum utilization of bus bandwidths. A Byte Parity Check Flag on each port ensures data integrity. These flags initialize for odd data parity at reset, but may be reprogrammed for even or odd parity.

Precision Chip Resistors

These precision Chip resistors are edge trimmed to tolerance providing excellent high frequency response. Edge trimming leaves a solid symmetrical block resistor void of any laser cuts eliminating the capacitive effects from a plunge or "L" cut trim.

- Resistance range 20ohm to 1 Kohm edge trimmed, 1 Kohm to 1 meg ohm non-edge trimmed
- Automatic laser trimming to ±.05% absolute
- Edge trim for high frequency applications
- Gold or solder coated terminations over a nickel barrier
- TCR ±50, 25 or 10 PPM °C — NiCr ±200, or100 PPM °C — TaN
- Single side or wrap around terminations
- Sizes — .020" x .040" to .100" x .100".

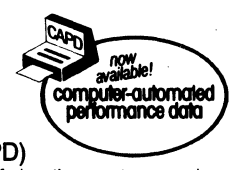
Mini-Circuits

how to use this guide

Over 1,000 RF/microwave signal-processing components are available from Mini-Circuits.



LOOKING FOR DATA ON A SPECIFIC MODEL? The model index contains a list of all models in alphabetical/numerical order with reference to specification and data pages.

SPECIFICATION PAGES. Each specification page is organized by series within the product line and by models within the series. Information given includes National Stock Numbers (NSN), equivalent MIL—part numbers, pin connection designations, case styles, and notes to the tables.

Full specifications for each model are given in table form. The various models within a series differentiate from each other by the frequency range they cover. Frequency range is defined in the tables by the lowest frequency f_L to the highest frequency f_U. For most models, the frequency range is further subdivided into three segments: L = low range, M = mid range, and U = upper range. Each range is defiined at the bottom of each table in terms of f_L and f_U.

CASE STYLES AND DIMENSIONS ARE EASY TO FIND . . . Each series has a particular case style. The specification page includes a photo and a reference number to the particular dimensions and outline drawing of the case, tolerances, bracket options, case material and finishes.

QUESTIONS AND ANSWERS... As the world's leading manufacturer of RF/microwave signal-processing components, we receive lots of phone calls with pertinent questions relating to RF/microwave signal-processing components, such as defining performance needs, estimating intercept points, and applying proper test procedures. We've gathered a number of such questions, with their answers, and encourage you to contact our Application Engineering staff when you need assistance.

Computer-Automated Performance Data (CAPD) is a Mini-Circuits innovation, offering the most comprehensive database for RF/microwave signal-processing components.

No more guesswork about RF/microwave signal-processing component performance in your systems design. Gain, directivity, input and output VSWR, conversion loss, isolation, and 1 dB compression point are given over a wide span of frequency data points; this allows a designer working within a narrow portion of the device's frequency range to pinpoint key parameters where it is most critical. The CAPD tables include typical values for each model, along with statistical process-control parameter "sigma" which is the measure of unit-to-unit variation. The more detailed and comprehensive the data available to the designer, the greater the probability of a sound and reliable design...the aim of Mini-Circuits' CAPD effort.

Call or write for your free copy of Mini-Circuits handbook on RF/microwave signal-processing components. Included is the most comprehensive compilation of data and design information, performance curves, "how-to-select" charts, and provocative Question and Answer sections.

Mini-Circuits

reliability and quality control

reliability and quality control

All Mini-Circuits' RF signal-processing components are subjected to rigid quality control procedures starting from raw material procurement through product production and final inspection; the objective—to supply our customers with the finest RF signal-processing components available. Here's a list of some of the procedures taken to insure high-quality performance and product reliability:

A. 100% testing of each unit in process.
B. 100% testing of each completed unit.
C. 100% inspection of every solder connection.
D. All transformers bonded to the header for protection against severe shock and vibration.
E. All resistors and capacitors bonded to the header for severe shock and vibration protection.
F. Resistor power dissipation derated more than 50%.
G. All components rated for greater than +125°C.
H. All transformer leads double wrapped.
I. Heavy coated wire insulation for HiPot/altitude.
J. Completely encapsulated for protection against mechanical shock/vibration and temperature shock.
K. Permanent case marking of model number.
L. Cupro-Nickel case for long-lasting finish especially under salt atmosphere conditions.

4.5 sigma unit-to-unit repeatability

Applying powerful statistical process control techniques, we guarantee "skinny" sigma on mixers and power splitters with the spec limit at least 4.5 sigma from the mean value (process capability Cpk of 1.5). This means production units shipped to you will very closely match the performance of samples we supplied for your evaluation and prototypes. Such product uniformity translates to substantial reductions in cost by trimming manufacturing throughput time, rework, specialized test equipment, troubleshooting, report paperwork, and inspection personnel. And more reliable performance of systems in the field under adverse conditions. Bottom line...a more competitive and profitable position.

mixers

ultra–rel mixers

All Mini-Circuits' Ultra-Rel mixers carry a five-year guarantee, a reliability breakthrough attributed mainly to H-P's unique Ultra-Rel diodes that easily meet and exceed MIL-STD-883 tests. Each diode must pass the following grueling tests:

LIFE	1,000 hrs. T_A +125°C 50 mA ac
THERMAL SHOCK	−65°C to +125°C, 200 cycles 5 min. dwell
MECHANICAL SHOCK	1.5Kg's, 0.5μsec pulse
VIBRATION	variable frequency 20 to 2,000 Hz
TEMPERATURE CYCLE	−65°C to +125°C 200 cycles, 10 min. dwell
AUTOCLAVE (pressure pot)	14.7 psi, T_A + 121°C, 96 hr.
85/85	85°C @ 85% humidity 168 hr., no bias
ACCELERATED HI-TEMPERATURE STORAGE	300°C, 325°C, 350°C storage until 50% failures

hi–rel mixers

Mini-Circuits hi-rel mixers are screened to:
(1) burn-in for 96 hours at 100°C with 8 ma at 1 KHz
(2) thermal shock per MIL-STD-202, Method 107
(3) Gross and fine leak tests according to MIL-STD-202, Test Method 112B, Conditions C and D.

tx mixers

For the most critical space, military or industrial applications in hostile environments, Mini-Circuits offers TX mixers. Stringent screening and stressing are applied to the TX mixers which employ TX hermetically-sealed diodes that have passed the following tests per MIL-STD-750: (1) high temperature storage for 340 hours at 150°C, Method 1032; (2) thermal shock, Method 1051, Test Condition C (−65°C to +150°C, 10 cycles); (3) constant acceleration, method 2006, Y1 orientation, 20,000 G's; (4) fine leak, Method 1071, Condition H; (5) gross leak, Method 1071, Condition C; (6) burn-in for 96 hours at 25°C, 75 mW/junction at 60 Hz, Method 1038, Condition B. They are then assembled into TX mixers which are then further exposed to these stress tests: (1) thermal shock, MIL-STD-202, Method 107; (2) burn-in for 96 hours at 100°C, with 8 ma at 1 KHz; (3) gross and fine leak, MIL-STD-202, Method 112B, Conditions A and C.

mil–mixers

Mini-Circuits' MIL mixers undergo further stresses per MIL-M-28837/1A as follows: 1) 12 hours of 20g (peak) 10-2000 Hz vibration over 4 hour intervals on each of three mutually perpendicular directions, 2) bake-in for 24 hours at 100°C, 3) burn-in for 48 hours at 100°C with 30 mA dc in each polarity, 4) thermal shock, MIL-STD-202, Method 107, Condition B, and 5) gross and fine leak, MIL-STD-202.

To order a Hi-Rel version of any Mini-Circuit mixer, add the suffix /Hi-Rel; for MIL versions, add suffix /MIL; for TX mixers, add suffix /TX.

power splitter/combiners

hi-rel power splitter/combiners

To assure high quality and long-term reliability, Mini-Circuits' Hi-Rel power splitter/combiners are subjected to:

1) bake-in for 96 hours at 100°C
2) thermal shock MIL-STD-202, Method 107, cond. A (100°C)
3) gross and fine leak tests, per MIL-STD-202, Test Method 112B, Condition C and D.

mil–power splitter/combiners

Mini-Circuits screens MIL-power splitter/combiners to MIL-P-23971 Group A and Group B electrical tests. In Group A, 100% of the lot quantity is tested. In Group B, tests are performed on units selected from Group A according to the sampling plan of MIL-STD-105 special inspection level S-3.

After each unit undergoes an environmental MIL-stress the units are electrically tested to ensure compliance with the applicable MIL specification and customer drawing. These tests generally include insertion loss, isolation, amplitude balance, VSWR, and phase balance.

MCL MIL components which undergo Group A and Group B of MIL-P-23971 are marked with the Mini-Circuits model number followed by /MIL.

When the military part number marking is required, the units must be on the QPL list or must be manufactured from a lot for which first article inspection has been performed. In this case, please contact the factory for pricing and contract requirements.

MIL power splitter/combiners are screened to MIL-P-23971 group A and group B electrical tests plus the following environmental stress tests: 1) thermal shock, MIL-STD-202, Method 107, test condition A, 2) terminal strength, MIL-STD-202, Method 211, test condition A, 3) resistance to solvents, MIL-STD-202, Method 215, 4) solderability, MIL-STD-202, Method 208, 5) vibration, MIL-STD-202, Method 204, test condition A, 6) shock, MIL-STD-202, Method 213, test condition G, 7) moisture resistance, MIL-STD-202, Method 106, and 8) salt spray, MIL-STD-202, Method 101, test condition B.

Above models are resistive power dividers to enable frequency coverage from dc to the highest rated frequency. Since resistive power dividers do not provide a high degree of isolation (basically isolation equals the insertion loss between parts), an amplifier such as Mini-Circuits' ZFL series is recommended when high isolation is required. Matched power rating 0.75W, internal load dissipation 0.375W.

For PC applications, select from the low-cost; plastic-case T series (small enough to be inserted into a standard 1/3 DIP socket), or the hermetically-sealed RFI shielded TMO metal-case series (requiring less PC are a than a flatpack or TO-5 can), or the plastic-case T-H series designed to handle up to 100 mA in the primary winding without appreciable saturation or change in RF characteristics.

Transformer core saturation is influenced by (1) dc current through the winding, (2) RF input power, and (3) frequency of operation. These three variables interact to affect the point at which saturation occurs, see Figs. (1) and (2). These curves show the point where distortion occurs, by visual observation.

Now comparing the T-H series to the conventional T-series in Figs. (1) and (2), note that saturation effects are negligible with the T16-1H; so for wide dynamic range applications, specify the T-H series.

These transformers may be operated as low as 12.5 ohms at the primary with essentially the same impedance matching ratio and only a slight change in frequency response. All Mini-Circuits' transformers are specified as step-up.

For each RF transformer model, the minimum and maximum frequency is given for the insertion loss at the 3 dB, 2 dB and 1 dB points, as shown in Fig. (3) and listed in the data chart. For example, the T1-1 insertion loss is 1 dB from 2 to 50 MHz and 3 dB from 0.15 to 400 MHz.

Coaxial connector models are available from 10 KHz to 500 MHz and are offered with 50 ohm and 75 ohm impedances; 75 ohm connectors are used at 75 ohm ports. The FT1.5-1, with unbalanced input and output, is especially useful for 50 ohm to 75 ohm matching applications. The FTB series with unbalanced output and balanced input (connector ground insulated from the case) helps eliminate ground loop problems, especially when long cable runs are involved.

description

These new high efficiency phase detectors are the only units in the world offering a figure-of-merit greater than 125.

The figure-of-merit M or efficiency of a phase detector can be defined as the ratio of maximum DC output voltage (in mV) divided by the RF power (in dBm). The maximum DC output from these units is 1000 mV with +7 dBm applied to the LO and RF ports, and DC offset is typically 400 microvolts. Thus, its figure-of-merit M is 143, which indicates a highly efficient phase detector. For comparison, a double-balanced mixer used as a phase detector offers 350 mV DC output with the same LO and RF inputs for a figure-of-merit M of 50.

Both the RPD and MPD are packaged in a hermetically-sealed EMI-shielded metal case. The miniature RPD measures 0.4 × 0.8 × 0.4 in. and the micromin MPD only 0.2 × 0.5× 0.25 in.

So when your system requires a high output phase detector, specify the new RPD or MPD series.

Digitally controlled noise sources with variable bandwidth & frequency to 18 GHz

- ***Streamline the design of high-power noise jammers***
- ***Improve performance of ATE systems***
- ***Speed up testing of communications channels***
- ***Improve intermodulation testing and spurious testing of frequency converters***

Noise Com's NCS-4100 Series noise sources have the unique ability to deliver white noise output that is variable over bandwidth and frequency in increments of 500 kHz from 500 MHz to 18 GHz. Bandwidth and optionally center frequency are varied by TTL digital control.

The power spectral density of an NCS-4100 increases with a given output power by 1 dB for each 20 percent reduction in bandwidth. The bandwidth can be up to 20 percent of the center frequency. Output is at least +10 dBm with flatness of ±0.5 dB over bandwidths up to 10% of the center frequency, and ±1.0 dB up to 20% of center frequency.

The NCS-4100 is available in MIL-E-5400-grade subsystem form or as a programmable bench instrument. Options include custom electrical specifications, IEEE-488 bus control, attenuators, switched outputs, and customer-specified modifications.

Noise Com's versatile NCS-4100 Series noise sources can make a big improvement in the performance of your system. To find out more, call **Gary Simonyan** at (201) 261-8797.

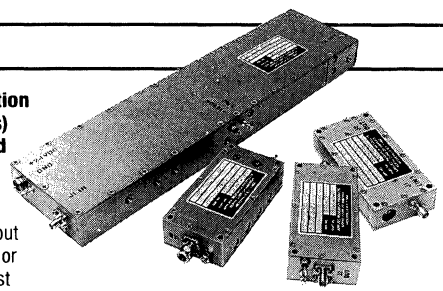
QUALIFIED SUPPLIER CERTIFIED TO MIL-Q-9858A AND MIL-STD-2000 TASK G

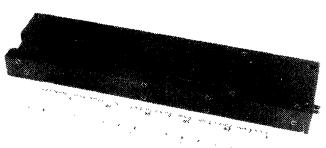
S-Band Transmitter

A 2.2 to 2.4 GHz transmitter available for use in Hi-G applications to 30,000 G's. Phase modulation to a modulation index of 5 with rates from 10 KHz to 5 MHz. Power output in excess of +23 dBm. Optional configuration available to provide bi-phase modulation with a 10 MHz bit rate. Small size resulting from in house hybrid micro-circuitry development.



Flight Termination Receiver

FM solid-state UHF band remotely operated receiver, receives an unmodulated RF signal under normal conditions. In the command state, two or three frequency modulated tones are decoded to provide monitor, arm and terminate commands. Optional configuration provides demodulated signal as an output.



RF Multipliers

Frequency generation through multiplication or phase-lock techniques (A thru J bands) for shipboard, airborne and ground based units.

If your system requires low additive phase noise, wide bandwidth (10%), high power output (10 watts) and multiplications from X2 to X144 or greater, Servo has the design to meet your most stringent requirements.

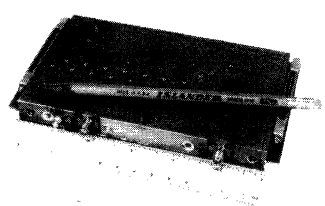
- Multiple Outputs
- Various Primary Power Sources
- Multiple Selectable Outputs
- Custom Multiplier Chains
- BITE
- Crystal Controlled Sources



Our Phase-Lock loops, comprised of I.C. components, together with RF devices, yield outputs of up to 10 watts at microwave frequencies. Our multipliers are available as passive devices or in combination with amplifiers having multiplication factors from 2 to 2000. In combination with varactor multiplier devices output in Ku-band can be obtained.

In addition, we can supply crystal oscillators or internal drivers to provide a self-contained source.

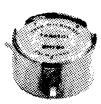
μicrOpuck® CIRCULATORS & ISOLATORS

The Micropuck® family of circulators and isolators was designed to maximize the use of isolators and circulators in stripline and microstrip applications. They are easy-to-mount devices with magnetic shielding which prevents detuning or changes in performance when operating in magnetic fields or in close proximity to ferrous metals. The round design and tab lead configuration allow installation at a reduced cost, replacing milling operations with a simple drilled hole.

The Micropuck® isolator is also available in a flange mount similar to the mounting used on some power transistors. This construction has input and output tabs located 180° from each other as opposed to the 120° separation of the round version. This provides an alternative choice for system designers who prefer the screw-down mounting and can allow the extra space it requires.



Specifications for these microminiature ferrite devices are as good as you'll find anywhere. Look at the data and call our ferrite sales group or local representative.

RESISTORS

THERMAL FUSE INCORPORATED CEMENT RESISTORS

- **MEG**
- **MES**
- **MER**

Since thermal fuses are incorporated, cement resistors respond quickly to overloading as well as external overheating.

These resistors also provide outstanding features against surges. Therefore they are suitable for the prevention of inrush current for switching regulators.

Precision Metal Film Resistors

■ ***Established Reliability*** ■ ***Hermetically-sealed***
■ ***MIL-R-55182, Style RNR/RNN*** ■ ***Characteristics C and E***

For the ultimate in reliability, stability and uniformity of construction, ANGSTROHM hermetically-sealed metal film resistors are unquestionably first-choice. ANGSTROHM has accumulated over 1.234 billion unit failure rate hours to MIL-R-55182 on the RNR/RNN style, characteristics C and E, without a single failure. The true glass-to-metal hermetically-sealed enclosure seals the resistor element in an inert gas atmosphere and protects it from virtually all adverse environmental influences. The glass enclosure will withstand in excess of 3000 p.s.i. external pressure without leakage. The reliability and stability of ANGSTROHM hermetically-sealed resistors have been established by their use in nearly every military, missile, aerospace, and oceanography program having the most demanding applications and the most hostile environments.

Features

- Qualified to MIL-R-55182 Characteristics C and E
- Performance far exceeds the requirements of MIL-R-55182
- Excellent long term stability

- Hermetic glass enclosure is impervious to harmful environments
- Inert gas filled
- Very low noise

Power Rating

Resistors shall have a power rating based on continuous full load operation at 125°C. For temperatures above 125°C, the load shall be derated per the Power Derating Curve for all styles. For power rating at temperatures below 125°C (down to 70°C) the load may be increased per the Power Derating Curve for the particular style selected. In no case should the voltage exceed the maximum voltage rating per the Style and Electrical Specifications table for types HN, HS and HT, in the ANGSTROHM Precision Metal Film Resistors Catalog.

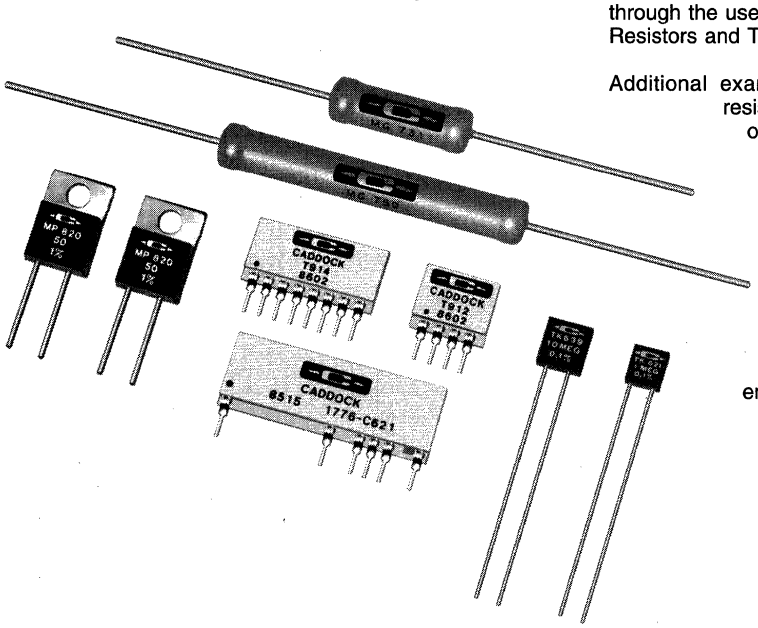
CADDOCK
HIGH PERFORMANCE FILM RESISTORS

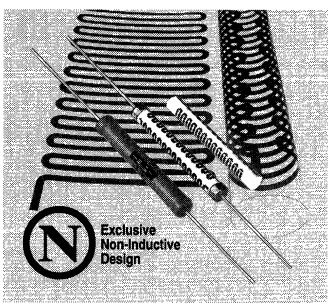
High Performance Film Resistors



The Caddock Electronics General Catalog describes over 200 in-production models of precision discrete resistors and resistor networks that utilize Caddock's high stability, extended life Micronox® and Tetrinox® resistance films. With over 25 years of experience and an exceptional record of in-circuit performance and reliability, Caddock Electronics continues to lead the industry in the development, production and on-time delivery of high performance film resistors

Caddock's Advanced Resistor Technology Provides Many Exceptional Performance Advantages:

Caddock's advanced resistor technology began in 1962 with the introduction of Micronox® harsh environment, high power and high voltage resistors. The Caddock technology was further extended in 1975 with the development of the Tetrinox® resistance system that made possible the introduction of low TC, ultra-stable resistors and resistor networks.



These technological advances have provided the electronics industry with a selection of precision resistor types that provide many high performance advantages.

- **Precision** - Tolerances as close as 0.01%.
- **Long-Term Stability** - Better than 0.005% per 1,000 hours of operation under full load operating conditions.
- **Higher Power Ratings** - Up to five times higher than other resistor technologies.
- **High Operating Temperatures** - Up to +275°C.
- **Ultra-Low Temperature Coefficients** - Standard to less than 10 ppm/°C and custom values as low as 2 ppm/°C.
- **Non-Inductive Design** - Available in resistance values from as low as 0.1 ohm to as high as 10,000 Megohms.

Caddock's Exclusive Non-Inductive Performance is Available in Both High-Power and High-Voltage Micronox® Film Resistors.

For wide-band, high frequency applications, the advantages of Caddock's Exclusive Non-Inductive Design are available in most models of Micronox® resistors. This special sepentine pattern provides for neighboring lines to carry currents in opposite directions thereby achieving maximum cancellation of flux fields over the entire length of the resistor.

The result is a truly non-inductive resistor that is about as inductive as a straight piece of wire the length of the resistor body. This efficient design means faster settling times and minimum distortion in all types of high frequency circuits.

The High-Performance Capabilities of Caddock Film Resistors Can Provide Improved Accuracy and Stability to Precision Circuitry:

Because of the special advantages of Caddock's resistance film technology, Caddock High Performance Film Resistors are often specified in the precision circuits that ultimately establish the overall accuracy and stability of the equipment.

Examples of such applications include many types of precision high-voltage supplies and voltage references that have achieved improved accuracy and extended-life stability through the use of Caddock Type MG Precision High-Voltage Resistors and Type T912 Precision Resistor Networks.

Additional examples of the application of this advanced resistor technology include the industry-wide use of Caddock Type 1776 and Type 1787 Precision Decade Divider Resistors in the signal input circuits of laboratory and bench-type digital voltage and current measuring instruments.

An introduction and index to these Caddock resistor technologies is provided on the next page. Additional information and technical assistance is also available directly from our application engineering team.

We welcome your call.

CADDOCK
HIGH PERFORMANCE FILM RESISTORS

Caddock process control, quality control and test programs

The outstanding levels of performance and reliability that Caddock resistors provide are maintained through intensive programs for manufacturing and process control, quality assurance testing and reliability verification:

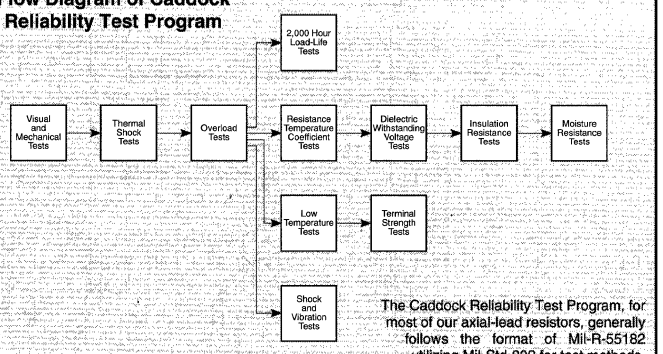
Manufacturing Control

Our manufacturing controls include processes for power conditioning, over-voltage conditioning and maximum temperature conditioning. We also perform many in-process tests to verify the performance levels and consistency of all our resistor types, and to screen out defects which do not meet our high standards.

Quality Control

The Caddock Quality Control System covers every step in the manufacturing process from the examination of incoming raw materials to the final testing and packaging of each resistor product.

To meet the most stringent Q.C. requirements, Caddock's Quality Control Procedures have been approved as being in conformance to MIL-I-45208 in surveys by military and space systems customers.



Reliability Verification

In addition to tests for tolerance, stability and temperature characteristics that are a part of our normal manufacturing procedures, we also perform semi-annual reliability tests to confirm compliance to our exacting product specifications.

The flow diagram of the Caddock Reliability Test Program for axial-lead resistors illustrates the sequence of the tests in this program.

Data from the Caddock Reliability Test Program is available to assist designers in qualifying Caddock resistor products for use on high reliability programs.

Flow Diagram of Caddock Reliability Test Program

The Caddock Reliability Test Program, for most of our axial-lead resistors, generally follows the format of Mil-R-55182 utilizing Mil-Std-202 for test methods.

Customer Required Quality Assurance Testing

For our customers whose program requirements for performance, quality and reliability verification include added testing, our specially developed in-house testing capabilities and data acquisition systems give us the ability to perform customer required testing for the most demanding program requirements.

Design Assistance and Assistance in Developing the Resistor Product Specifications

By providing design assistance and technical support at the initiation of a new design and a new Specification Control Drawing (SCD), we have often been able to achieve improvements in both the resistor product performance and cost while fully achieving the program's quality objectives.

For assistance in design and specification development and assistance in the application of our quality assurance testing capabilities to your specific circuit performance and program needs, call or write our applications engineers at our main offices in Riverside, California.

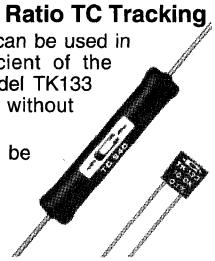
Extended Maximum Continuous Operating Voltage Rating



Maximum continuous operating voltages up to 60% higher than the values listed in the table can be achieved through special factory conditioning, provided the power ratings are not exceeded. To specify maximum continuous operating voltages above the values listed in the table, add a "-15" to the model number (Example: TG950-15). Note that the standard overload and overvoltage ratings do not apply to the "-15" resistors.

Combine Type TG and Type TK Resistors for Low Ratio TC Tracking

The Type TG Low TC Precision High Voltage Resistors can be used in combination with the low Absolute Temperature Coefficient of the Type TK Low TC Precision Radial-Lead Film Resistors (Model TK133 with TC of 5 ppm/°C) to achieve 30 ppm/°C Ratio TC without special matching.

With special matching, a **Ratio TC of 10 ppm/°C** can be achieved.

The low temperature coefficient for both the Type TG and Type TK resistors will also minimize ratio drift due to power dissipation warm-up.

HIGH PERFORMANCE FILM RESISTORS

Type MG Precision High Voltage Resistors

Now with Extended Resistance Range to 10,000 Megohms and Additional Models

Temperature Coefficient as tight as 80 ppm/°C. Combined with Excellent Long-Term Stability, and Precision Tolerances.

Caddock's Micronox® resistance films are the source of the Type MG Precision High Voltage Resistors' outstanding combination of performance features:

- Single-resistor values as high as 10,000 Megohms.
- Maximum continuous operating voltages as high as 48,000 volts ("-15" Ratings).
- Overvoltage capabilities of 150% of standard working voltages for all models and values.
- Resistance Tolerances from ±1.0% to ±0.1%.
- Temperature Coefficient, for standard resistance range, of 80 ppm/°C in combination with resistance tolerances as tight as ±0.1%.
- Typical extended life stability of 0.02% per 1,000 hours for standard resistance range as demonstrated by reliability testing.

This exceptional performance has been proven through many years of use in equipment that demands the highest reliability and stability, including TWT amplifiers, X-ray systems, geophysical instruments and medical electronics.

Preconditioning for Power and Voltage Ratings

All power ratings and maximum operating voltage ratings are for continuous duty. These ratings are based on pre-stress voltage levels applied during the manufacturing process to provide for stable resistor performance even under momentary overload conditions.

Maximum operating voltages 60% higher than the values listed in the table may be specified by adding "-15" to the model number (Example: MG750-15), provided power ratings are not exceeded. Note that overload and overvoltage ratings do not apply to the "-15" resistors.

Non-Inductive Performance

Most models are manufactured with Caddock's patented Exclusive Non-Inductive Design which uses a serpentine resistive pattern that provides for neighboring lines to carry current in opposite directions, thereby achieving maximum cancellation of flux fields over the entire length of the resistor. This efficient non-inductive construction is accomplished without derating of any performance advantages.

Type MX Resistors Utilize Caddock's Patented Coating Design

Type MX Lab Grade Precision High Voltage Resistors combine Caddock's Exclusive Non-Inductive serpentine pattern with a patented, high thru-put screen printed silicone coating. The alignment of the gap in the coating pattern with the gap in the serpentine resistor pattern provides a complete encapsulation of the resistor element. The cap and lead assemblies are pressed onto the resistor core, finishing the resistor and providing rugged terminal attachment.

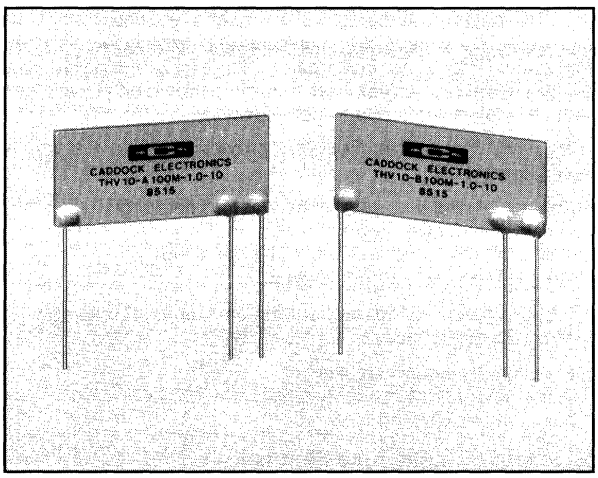
Type THV Precision High Voltage Divider Networks

CADDOCK
HIGH PERFORMANCE FILM RESISTORS



Ratio TC to 10 ppm/°C, Ratio Tolerance to ±0.25%, Voltage Ratings of 10 KV, 15 KV or 20 KVDC

The Type THV Precision High Voltage Divider Networks introduce Caddock's advanced high voltage resistor technology which doubles the allowable working voltage over the length of the high voltage section. This technology combines Caddock's Tetrinox® resistance films with a patented laser-generated V-Notch Geometry which optimizes the voltage gradient over the length of the resistance pattern.

Type THV networks provide tighter ratio temperature coefficients and tighter ratio tolerances than have previously been available in standard high voltage divider products.

- Ratio Temperature Coefficients of 10 ppm/°C or 25 ppm/°C from -55°C to +125°C.
- Ratio Tolerances of ±0.25%, ±0.5%, ±1.0% or ±2.0% at Rated Voltage.
- Voltage Rating of 10 KVDC, 15 KVDC or 20 KVDC at +125°C.
- Standard Voltage Division Ratios of 1,000:1 or 100:1, with custom ratios available.

These specifications can provide important improvements in performance in many types of advanced electronic systems, including TWT power supplies, radar systems, X-ray systems, analytical equipment and high resolution CRT displays.

CADDOCK
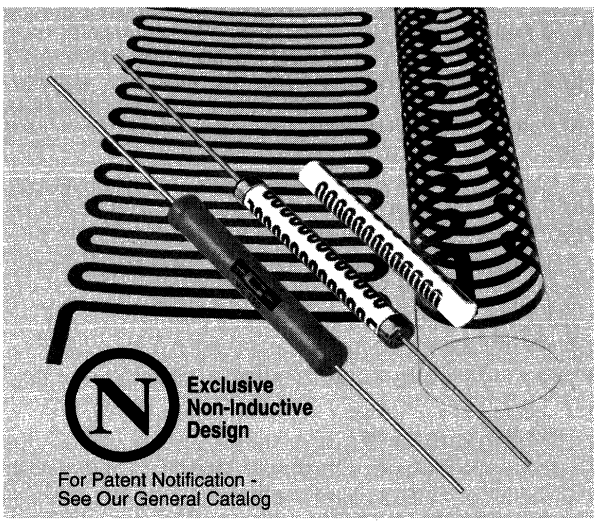
HIGH PERFORMANCE FILM RESISTORS

Type MS and MR Power Film Resistors

Power Film Resistor Family with Wide Resistance Range and +275°C Maximum Temperature

With power ratings to 15 watts and voltage ratings as high as 6,000 volts in an axial-lead resistor with values to 30 Megohms, the Type MS Power Film Resistors deliver the performance capabilities that can simplify circuit design and reduce equipment cost and complexity.

Type MS Power Film Resistors provide all these features in a single resistor:



- Full power and voltage ratings, without derating:
  - for non-inductive performance.
  - for high resistance values that extend the critical resistance value up to 10 times.
- Higher voltage ratings without the limitations of minimum wire size and spacing.
- Excellent long-term stability.
  Tests demonstrate typical stability of 0.05% per 1,000 hours over extended life.

Micronox® Resistance Films

Type MS performance begins with Caddock's Micronox® resistance films. Produced exclusively by Caddock Electronics, these proven complex oxide films have been used reliably for over 25 years in Caddock's precision power resistor products.

Micronox® resistance films are fired directly onto a ceramic core at temperatures above 1400°F. These resistance films have demonstrated outstanding stability when exposed to a high ambient temperature, thermal shock and high power densities.

This unique approach to precision power resistors opens new design possibilities by providing a wider resistance range, precise temperature characteristics, and higher temperature and power handling capability.

There's no derating of performance with Caddock's Exclusive Non-Inductive Design.

Most models are manufactured with Caddock's patented Exclusive Non-Inductive Design which uses a serpentine resistive pattern that provides for neighboring lines to carry current in opposite directions, thereby achieving maximum cancellation of flux fields over the entire length of the resistor. This efficient non-inductive construction is accomplished without derating of any performance advantages.

The result is a truly non-inductive resistor that is about as inductive as a straight piece of wire the length of the resistor body. This efficient design means faster settling times and minimum distortion in all types of high frequency circuits.

Carefully Controlled Manufacturing and Test Procedures Assure Compliance with Strict Quality Control Requirements.

Manufacturing Control

Type MS Resistors are produced under intensive manufacturing controls with processes which include power conditioning, overvoltage conditioning and maximum temperature conditioning.

Quality Control

From the certification and testing of all materials to the supervision of manufacturing processes, all Caddock Type MS and MR Power Film Resistors are produced under procedures that have been approved for conformance to the requirements of Mil-I-45208 in many recent surveys.

Reliability Verification

Type MS resistors are included in the Caddock Reliability Testing Program. Conformance to specification parameters including Extended Life, Shock, Vibration and Humidity are verified on a periodic basis. Data from Type MS resistors can be compared by similarity to other Caddock resistor types, since Type ML, MM, MS, MP, MG and MK represent an identical combination of materials - aluminum oxide substrate, Micronox® resistance film and silicone insulating coating.

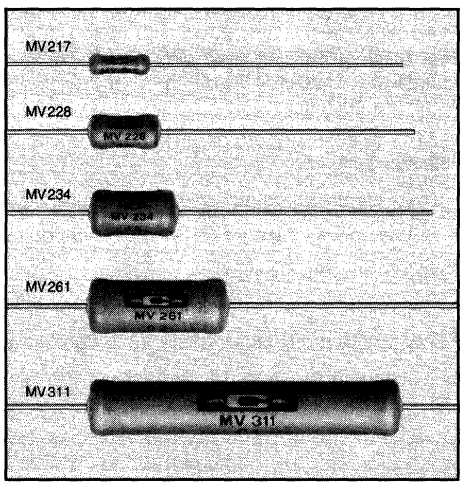
Type MV Low Resistance Power Film Resistors

CADDOCK
HIGH PERFORMANCE FILM RESISTORS



Values from 0.1 Ohm to 50 Ohms with Exclusive Non-Inductive Design

Type MV Low Resistance Power Film Resistors combine Caddock's Exclusive Non-Inductive Design with many high performance capabilities of Micronox® resistance films to achieve these special advantages:

- Low Resistance - from 0.1 ohm to 50 ohms.
- Maximum Operating Temperature up to +275°C.
- Five Sizes and Power Ratings.
- Full Power Ratings without derating for Non-Inductive Performance.

The interdigitated terminations in the Type MV resistors provide a multiple-path distribution of the current into parallel resistance sections, which provides low resistance values and non-inductive performance. This Exclusive Non-Inductive Design provides significant performance improvements in high speed or inductance sensitive electronic circuits, including high performance power amplifiers, high-speed data transmission systems, high frequency video amplifiers, current switching circuits and current sensing circuits.

Cost Effective Non-Inductive Design

The MP816 Kool-Pak™ Power Film Resistor is constructed with our Micronox® resistance film fired onto a flat substrate. The terminal attachment and resistance element geometry are configured to provide outstanding non-inductive performance. The resistor body is then completely surrounded by a high thermal conductivity molding compound to finish this cost effective power resistor package.

*** DERATING CURVE**

The case temperature is to be used for purposes of establishing the maximum applied power. See Derating Curve. The case temperature measurement is made with the thermocouple contacting the bottom insulated mounting surface of the package (center of bottom surface), the device mounted on a heat sink, themal grease applied at a mounting torque of 6 to 8 in-lbs. Without a heat sink, when in free air at 25°C, the MP816 is rated for 2.25 watts.

Derating for case temperature above 25°C is 0.128 W/°C.

Mounting Note: The MP816 must be mounted using a screw and compression washer mounting technique. This will provide sufficient pressure on the package over time and through large temperature variations to maintain the maximum power disslpation capability. Maximum torque to be applied to mounting screw is 8 in-lbs.

Non-Inductive Design

Series MP820 Kool-Tab™ Power Film Resistors are constructed with our Micronox® resistance film fired onto a flat substrate which is thermally bonded to the copper heat sink tab. The resistor body is then molded in silicone to finish the TO-220 configuration. The lead wire attachment and resistance element geometry are configured to provide outstanding non-inductive performance.

*** DERATING CURVE**

The case temperature is to be used for purposes of establishing the maximum applied power. See Derating Curve. The case temperature measurement is made on the metal mounting tab against the molded body. Without a heat sink, when in free air at 25°C, the MP820 / MP821 is rated for 2.25 watts.

Derating for case temperature above 25°C is 0.133 W/°C.

Mounting Note: Maximum torque to be applied to mounting screw is 8 in-lbs.

HIGH PERFORMANCE FILM RESISTORS

Type MK Precision Power Radial-Lead Film Resistors

Non-Inductive with New Expanded Resistance Range — 1 Ohm to 100 Megohms

Here are the low cost precision resistors that provide high density packaging in large volume printed circuit applications. Available in two miniature rectangular package configurations with standard lead spacings, Type MK Precision Power Radial-Lead Film Resistors now cover the entire resistance range from 1 ohm to 100 Megohms.

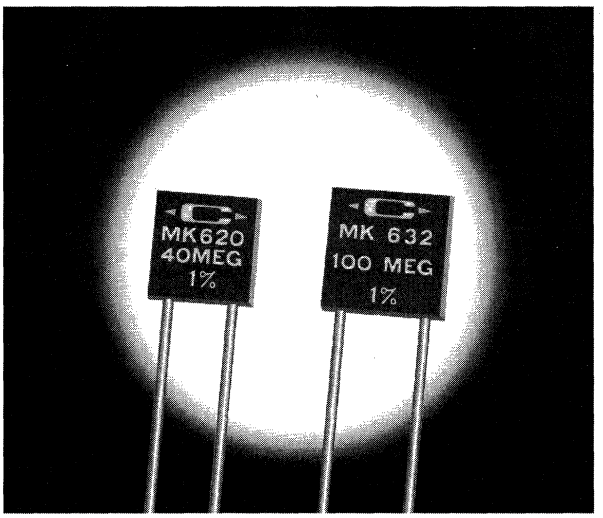
Constructed with Caddock's Micronox® resistance films fired onto a solid ceramic substrate, Type MK Precision Film Resistors combine all of these outstanding advantages:

- **±1% Resistance Tolerance is Standard** - tolerances to ±0.1% are available on special order.
- **Operating Temperature** - from -55°C to +175°C.
- **Full Power Rating at +125°C.**
- **Temperature Coefficient is Only 50 ppm/°C from 5 ohms to 5 Megohms and 80 ppm/°C up to 100 Megohms** - referenced to 25°C with the ΔR taken at -15°C and +105°C.
- **Extended Life Stability is Typically Better Than 0.1% per 1,000 Hours.**
- **Caddock's Non-Inductive Performance** - provides faster settling times and minimum distortion in all types of high frequency circuits.

This combination of performance advantages in a small, standardized case can simplify many engineering and production problems:

One size of Type MK resistor can replace many sizes of axial-lead resistors.

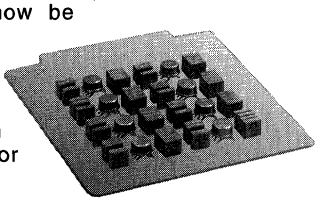
This table of "RN" style axial-lead resistors shows the many sizes and power ratings that can be replaced with either of the two models of Type MK Precision Film Resistors within the maximum allowable voltage ratings.



Comparison of Type MK and "RN" Ratings and Dimensions

Resistor Type	Power Rating	Maximum Resistance	Mounting Hole Spacing	
MK120 or MK620	**.50 W**	**40 Megohms**	**.150 (3.81)**	Even the smallest Type MK resistor can replace all of these RN type resistors
MK132 or MK632	**.75 W**	**100 Megohms**	**.200 (5.08)**	
RN50	.05 W	1 Megohm	.400 (10.15)	
RN55	.10 W	5 Megohms	.500 (12.70)	
RN60	.125 W	10 Megohms	.625 (15.90)	
RN65	.25 W	20 Megohms	.875 (22.20)	
RN70	.50 W	40 Megohms	1.000 (25.40)	

DIMENSIONS IN INCHES AND (MILLIMETERS)



The largest Type MK - rated at .75 watt - requires less board space than even the .05 watt RN50.

The smallest Type MK - rated at .50 watt - provides power dissipation **equal** to the RN70 resistor. The RN70 resistor requires a mounting hole spacing of 1 inch and a side-to-side spacing of .25 inch, resulting in a total mounting area of .25 square inch - **10 times the area required for a .50 watt Type MK resistor!**

One standard resistor configuration can simplify board layouts.

With the exceptionally wide range of resistance values that are available in each model of Type MK Precision Film Resistors, circuits can now be designed for maximum packaging densities without the need for leaving extra space where resistor value changes can require larger resistors or non-uniform lead spacings.

Standardization of resistor size can speed assembly procedures and reduce procurement costs.

The standardization of resistor size can pay additional dividends by simplifying assembly procedures. The radial leads do not require additional bending prior to insertion, and the standard lead spacing can reduce the time required for assembly.

The combination of higher power ratings and smaller size can also lower procurement costs. By reducing the wide variety of sizes and types of axial-lead resistors to a single, standardized resistor type, unit prices can be lowered and inventory problems simplified. HIGH PERFORMANCE FILM RESISTORS

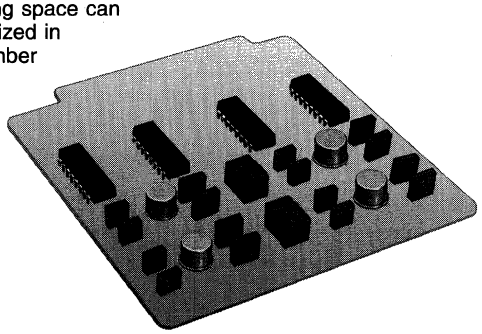
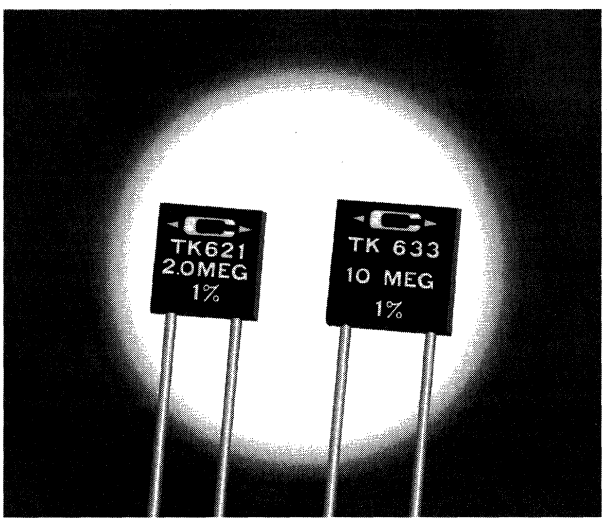
Type TK Low TC Precision Radial-Lead Film Resistors

Low TC of 5 ppm/°C, 10 ppm/°C or 20 ppm/°C and Resistance Range from 1Kohm to 10 Megs



Caddock introduces a new design element for precision electronic circuitry - an advanced technology breakthrough that solves many critical circuit stability problems - the **Type TK Low TC Precision Radial-Lead Resistors with the Tetrinox® resistance system.**



Type TK Low TC Precision Radial-Lead Film Resistors provide a combination of performance advantages never before available in a resistive component:

- **Low Temperature Coefficient** - better than 5 ppm/°C, 10 ppm/°C or 20 ppm/°C over the entire temperature range from -55°C to +125°C!
- **Long-Term Absolute Stability** - better than ±0.05% per 2,000 hours of operation.
- **Extended Resistance Range** - from 1,000 ohms to 10 Megohms.
- **Precision Tolerances** - ±1% is standard, and tolerances as close as ±0.05% are available.
- **Wide Operating Temperature Range** - from -55°C to +175°C.
- **Small Size** - with three miniature rectangular cases for maximum packaging density and minimum mounting area.
- **High Power Density** - with power ratings of .2 watt and .3 watt in molded cases, the largest of which is a standard CK06 package.

- **Caddock's Non-Inductive Performance** - provides faster settling times and minimum distortion in all types of high frequency circuits.
- **High Density Packaging** - the radial-lead mounting and small rectangular case of the Type TK resistors permit high packaging densities in low profile circuitry. Because the three models of the Type TK resistors are available in an exceptionally wide range of resistance values, lead spacing and mounting space can be standardized in a larger number of designs.

Building on over 20 years of experience with our unique complex oxide technology, Caddock has perfected the Tetrinox® resistance system - the first high resistance system to provide a TC that is well within 10 ppm/°C and that is also essentially linear over the entire temperature range from -55°C to +125°C.

The exceptional performance of Type TK resistors can achieve improvements in many circuit applications:

Low TC "Matched-Pair" Voltage Dividers Can be Assembled Without Pre-Selection of Resistors.

An important application for Type TK resistors is in "matched-pair" voltage dividers where the low 10 ppm/°C temperature coefficient provides ratio tracking of less than 20 ppm/°C without resistor pre-selection or special testing.

With factory selection, Type TK resistor pairs can be matched to within 1 ppm/°C.

Extended Resistance Range Reduces Power Requirements

Because the Type TK resistors provide resistance values as high as 10 Megohms - values that are up to 100 times higher than other types of ultra-low TC resistors - engineers can now design precision circuits with lower current drain and lower power requirements.

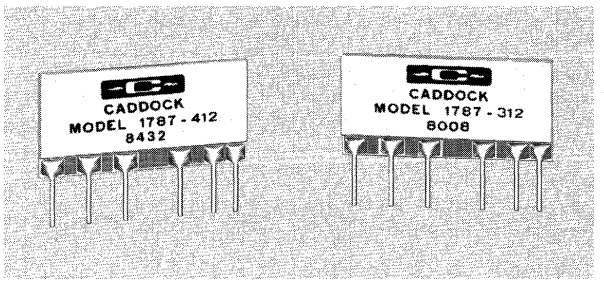
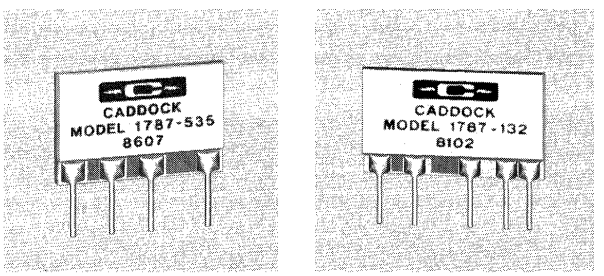
Type 1787 Current Shunt Resistor Networks



Accurate Current Sensing in Multi-Range Instrumentation



Type 1787 Current Shunt Resistor Networks utilize Caddock's Micronox® resistance films and advanced high thru-put laser manufacturing capabilities to achieve many vital advantages in precision current measurement circuits, including laboratory and bench-type digital instrumentation:

- The thin-profile single-package configuration replaces as many as four discrete current shunt resistors.
- The monolithic construction and standardized lead spacing simplify installation.
- Caddock Micronox® resistance films provide exceptional stability for improved long-term measurement accuracy.

Twelve standard models in five network arrangements provide the specific accuracy and resistance values required for a wide range of current measuring instruments and circuits.

Prototype quantities of most models of the Type 1787 Current Shunt Resistor Networks are available either from stock or within 6 weeks after receipt of order.

Low Absolute TC and Ratio TC in Resistor Networks with Custom Performance

The exceptional design flexibility provided by the Type T1794 Custom Low TC Precision SIP Resistor Networks gives each circuit designer the freedom to choose the precise combination of specifications required to optimize both the performance and the price of custom precision and ultra-precision resistor networks.

For precision analog designs with special circuit requirements, Caddock's Type T1794 Custom Low TC Precision SIP Resistor Networks are available with performance that includes:

- **Resistance Values:** from 500 ohms to as high as 50 Megohms.
- **Absolute Tolerances:** ±1.0%, ±0.50%, ±0.25%, ±0.20%, ±0.10%, ±0.05% or ±0.025%.
- **Ratio Tolerances:** ±1.0%, ±0.50%, ±0.25%, ±0.20%, ±0.10%, ±0.05% or ±0.025%.
- **Absolute Temperature Coefficient:** 50 ppm/°C, 25 ppm/°C or 15 ppm/°C from 0°C to +70°C.

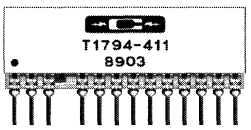
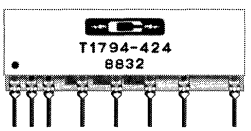
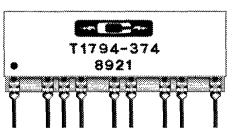
- **Ratio-of-Ratios:** as required, to as close as 0.025%.



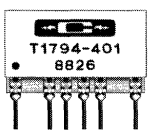
The unique thin-profile, single-in-line edge-mount package design allows the wide range of flexibility necessary to blend the performance of Tetrinox® resistance technology with particular circuit specifications to arrive at the final network package size, pin spacing and pin style.



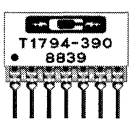
By optimizing both performance and configuration, many designers find that these precision networks can achieve savings in both component costs and insertion costs, as compared to discrete precision resistors - even in production lot quantities as low as 1,000 units.



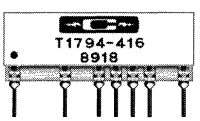
Applications for the Type T1794 Custom Low TC Precision SIP Resistor Networks include:

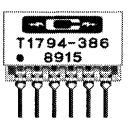


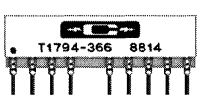
- **Voltage Divider Networks**
- **Amplifier Gain-Setting Networks**
- **Differential Input Networks**
- **Attenuator Networks**
- **Current-to-Voltage Converter Sense Networks**

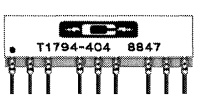


Our high thru-put manufacturing capability is now committed to the production of these custom precision resistor networks. Custom network designs for requirements that range from 500 networks per year to 400,000 networks per year are now in production.









Optional Pin Style

Low profile, single-in-line package with one row of right-angle pins.

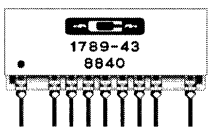
Type 1789 Custom Low Resistance Value Precision SIP Resistor Networks

CADDOCK
HIGH PERFORMANCE FILM RESISTORS

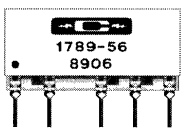
Low Resistance Custom Resistor Networks with Values as Low as 0.5 ohm

The design flexibility achieved by Caddock's advanced resistance film technologies is extended to low resistance values in precision resistor networks through the application of Caddock's Micronox® resistance films.

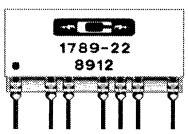
By applying this technology to the low-profile, single-in-line package configuration, the Type 1789 Custom Low Resistance Value Precision SIP Resistor Networks are available with a combination of features, which include:



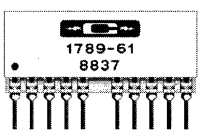
- **Resistance Values:** from 0.5 ohm to 10,000 ohms.
- **Absolute Tolerances:** ±1.0%, ±0.50%, ±0.25%, ±0.20%, ±0.10% or ±0.05%.
- **Ratio Tolerances:** ±1.0%, ±0.50%, ±0.25%, ±0.20%, ±0.10% or ±0.05%.
- **Absolute Temperature Coefficient:** 100 ppm/°C, 80 ppm/°C or 50 ppm/°C from 0°C to +70°C.
- **Ratio Temperature Coefficient:** 80 ppm/°C, 50 ppm/°C, 25 ppm/°C or 15 ppm/°C from 0°C to +70°C.
- **Power Rating:** 100 mW to 2 Watts per resistor.



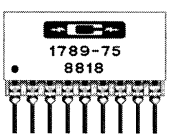
Where high accuracy and low resistance values must be combined - as in high accuracy current measurement circuitry - Kelvin terminations can be provided for low resistance values to minimize lead resistance errors.



The optimum design of Type 1789 Custom Low Resistance Value Precision SIP Resistor Networks is best achieved when the performance of Micronox® resistance film technologies is blended with particular circuit specifications and the unique thin-profile, single-in-line package design to arrive at the final network package size, pin spacing and pin style.



Applications for the Type 1789 Custom Low Resistance Value Precision SIP Resistor Networks include:



- **Current Summing Networks**
- **Precision Termination Networks**
- **Precision Current Shunts**
- **Current Sensing Networks**
- **Impedance Matching Networks**

SERIES 800 AND 1000

This general line is available in a wide variety of sizes and terminations. They retain the non-inductive and heavy load characteristics of all Carborundum ceramic resistors. These resistors can handle up to 1000 watts, 165 KJ and 165 KV in resistance values from 1 ohm to 1 megohm.

Parts are specified by the four or five character type number (for example 885SP, 888AS, 890A), the first two digits of the resistance, a single digit to indicate the power of ten multiplier, and a "J" for ±5%, a "K" for ±10%, or an "L" for ±20%. Where the resistance is less than ten ohms, the power of ten multiplier is not used, and an "R" replaces the decimal point. Thus R50 = 0.50 ohm, 7R5 = 7.5 ohm, 220 = 22.0 ohm, 152 = 1500 ohm, etc. Standard construction for SP resistors is aluminum metalization. Type A resistors have nickel metalization. *Type AS resistors have silver metalization with a dielectric coating. These standard features are designated by "DS." The AS resistor can also be supplied for oil applications with "GO" or "HO" which provide a radial or horizontal tab terminated resistor, coated for use in oil. "N" provides a no arc terminal with a dielectric coating for applications requiring high energy or current density performance. Consult Customer Service for additional options and part number detail. A typical part number would be 886AS501KD. This represents a type AS resistor, 5" long × ¾" diameter, 500 ± 10% ohms, with dielectric coating and silver terminations.

Termination and Mounting

Electrical connection to the resistive bodies of resistors is made by flame-sprayed metal end bands. The standard metal is aluminum for type SP, nickel or silver for types AS and A. Special terminations of brass or copper overspray or tinned ends are readily available specials. Add "B," "C," or "T" respectively to the part number to designate these special terminations.

In most cases, connections to the resistors may be made by stock clips such as these:

TYPE AS EPOXY COATED STYLE

Carborundum Type AS High-Energy Ceramic Resistors are available with an epoxy coating which protects the resistors body from contaminants. It is especially useful where the resistor is employed in an application where it is not protected from a dirty ambient atmosphere or where it is immersed in a cooling or dielectric fluid. Energy level in oil should not exceed 300 joules/cc.

The overall length, L, of the coated resistor is approximately 0.25" longer than the uncoated part; the diameter, D, is approximately 0.30" greater. Coated resistors are also available with an axial mounted tab.

SPECIAL PURPOSE Wirewound Resistors

Engineered to Your Special Requirements

A COMPANY OF VISHAY DALE®

The photo at left illustrates only a few of the many special purpose wirewound resistors built by the Dale Special Products Section in the Wirewound Division.

Full-time engineers assigned to this section draw on the industry's largest file of non-standard resistor design and production information. Often, in a matter of minutes, these engineers determine a fast, practical route to the production of your non-standard part.

The list below shows some of the options and combinations which can be achieved:

WIREWOUND OPTIONS

Construction: Heat sink, silicone coated, epoxy or silicone molded (single or multi-element), hermetic seal (ceramic tube or metal can encapsulated), clip mounted or fireproof inorganic construction.

Leads: Radial and axial type, special materials and dimensions, spaded, threaded, insulated, quick-disconnect eyelet, printed circuit, ferrule.

Matching: T. C. by pairs, value and set, close tolerance, resistance ratio.

Special Types: Extended low or high resistance range, adjustable, low reactance, special wire alloys, very low or high T. C., high stability, special tolerances, tapped, water cooled, temperature sensitive, inductive.

Pre-conditioning: Power aging, temperature cycling, temperature and power, short-time overload, thermal shock, X-ray, temperature aging.

Shunts: Low value, 4-terminal resistors built to customer specifications or designed by our engineers to meet your current sensing requirements.

Fuse Resistors: Our hybrid components designed to act as an ordinary resistor under normal circuit conditions, and as a fuse under fault conditions. Dale offers a variety of standard types, physical sizes and basic styles. Each application should be referred to Dale for an individual design to insure optimum performance in any particular circuit. See our special pages on fuse resistors.

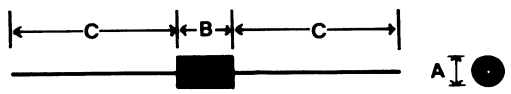
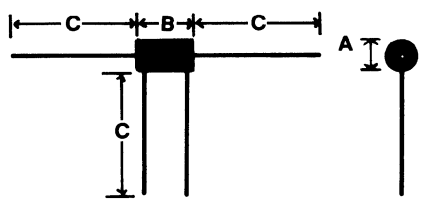
PRECISION WIREWOUND RESISTORS

GENERAL RESISTANCE
A PRIME TECHNOLOGY COMPANY



1,500,000 resistors in stock — all manufactured to meet the most exacting standards of accuracy, stability and reliability.

General Resistance has been engaged in the development and manufacture of precision wirewound resistors for over 30 years. The widest possible range of form factors is available, including axial and PC mounting types, in resistance values and accuracies to meet virtually any requirement.



"Standard values" are normally available from stock. And *any* resistance value from 1Ω to 1,100,000Ω, as well as accuracies other than the "standard" ±0.1%, ±0.025% and ±0.01%, are available.

All General Resistance resistors are manufactured to the exacting standards typified by military specifications such as MIL-R-93/ MIL-R-39005 (RB and RBR styles).

UH-1M–NEW RESISTOR PRODUCT

Hy-Meg Corporation, thru the use of state-of-the-art thick film technology, is now able to offer resistance values up to 3 teraohms with nearly identical performance as standard thick film axial leaded resistors. By using a cermet film element, we are able to manufacture a resistor with electrical and mechanical properties far exceeding those of the older carbon element type resistor.

The protective coating used on UH-1M resistors was developed to provide long term stability and exceptional protection against moisture.

DIMENSIONS

POWER RATING: The power rating for any UH-1M resistor is 1 watt at 25°C.

RESISTANCE: UH-1M resistors are available in values from 1×10^8 to 3×10^{12} Ohms.

TOLERANCE: 1,2,5,10 and 20 percent are available over the entire value range.

MAXIMUM WORKING VOLTAGE: 1,500 volts DC.

MAXIMUM OPERATING TEMPERATURE: 125°C ambient.

ISA-PLAN® PRECISION RESISTORS

ISA-PLAN® precision resistors, or current sensors are ideal for sensing and controlling current. ISA-PLAN® resistors are the result of long term development with the intention of creating a small and effective measuring resistor for current measurement up to 50 A and more. Using a new and advanced production technology we are able to offer a product with excellent physical properties at a very low price.

ISA-PLAN® resistor elements are etched from a foil rolled from the high precision resistance alloy MANGANIN®. The shape of the resistor is ideal with respect to the power rating, accuracy and inductance. The substrate is either a specially treated aluminum sheet, or a glass fibre laminate with high thermal and mechanical stability and a coefficient of thermal expansion specially adapted to MANGANIN®. To maximize heat dissipation additional copper foils are placed in the laminate. The high power limits of the resistor are achieved by using high temperature resistant materials of special construction with a good heat dissipation over the substrate towards the terminals. To protect the resistors against environmental influences and moisture, type C and A resistors are coated with a chemically resistant and insulating sintered epoxy. Resistor types PBH and PBV are constructed similar to TO-power semiconductors and are transfer-molded in a special high temperature resistant epoxy. Self-heating under nominal load is typically 30°C. The maximum temperature of an application depends on the required accuracy as indicated in the temperature/resistance curve of MANGANIN®.

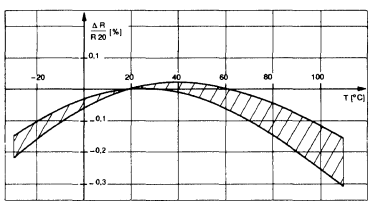
HIGH POWER CAPABILITY

High power resistors are bonded onto an anodized aluminum plate so that the heat generated can effectively flow to an external heat sink.

The very low thermal resistance of less than 1.5K/Watt for type A and C high-load resistors allows power ratings up to 10 Watt without losing the 0.1% accuracy.

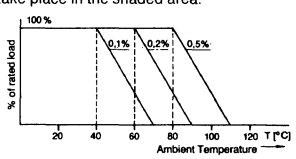
Type PBH and PBV resistors allow power ratings up to 10 Watts, also. Because of their higher internal heat resistance of less than 4K/Watt and because of their slightly different design, the accuracy remains within 0.5% of nominal resistance value at full rated power.

FOUR-POLE TECHNIQUE (KELVIN-TERMINATIONS)



When testing a low-ohmic resistor, the resistance of the lead-wire and its influence on the temperature coefficient must be considered. This influence can be eliminated if the voltage drop is measured on the resistor itself, or even better, inside the resistor. ISA-PLAN® etching technique allows the use of internal Kelvin connections to the resistor element.

Using this design a 1mΩ resistor with a tolerance of 0.2%, or a 10mΩ resistor with a tolerance of 0.1% having a temperature coefficient of resistance below 10ppm/°C is possible. Whereas with wire-wound resistors this can only be achieved with rather high additional costs and moderate success.



EXTREMELY LOW TCR

ISA-PLAN® resistor elements embody a foil rolled from the high precision resistance alloy MANGANIN®.

The resistance-temperature curve for MANGANIN® is parabolic. Therefore the temperature coefficient of MANGANIN® is not constant.

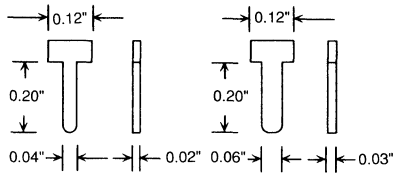
Temperature dependence of resistance of ISA-PLAN resistors. Due to different design and nominal values a variation may take place in the shaded area.

Power derating curve for resistors type A and C for different tolerances.

TWO-POLE TECHNIQUE

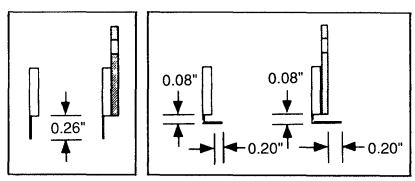
Due to the influence of the leadwires, two pole resistors show a distinct increase of tcr for values of less than 50 mΩ.

For resistance values below 50 mΩ and where high accuracy is required, four-pole resistors (type A, type PBV) instead of two pole resistors (type C, type PBH) are recommended.



DIMENSIONS AND TERMINALS

The use of large, solid copper alloy terminals of high conductivity and mechanical strength guarantees very low connector resistances and an optimal current density within the resistor. A considerable amount of the heat being produced in the resistors can be dissipated by these terminals over the whole printed circuit.



Regarding type A and type C resistors, terminal type K2 is normally used for resistors below 10mΩ and on the high-load version for values less than 50mΩ to 100mΩ. Terminal K2 can be used on other types on request.

PBH and PBV resistors are manufactured with standard terminals (see detail drawings). For special applications, i.e. horizontal mounting or plug connectors we offer style F2.

TYPE OF TERMINALS

CONNECTION TYPES

The tcr varies with temperature according to graph 1255 in a narrow range of values.

The dotted lines in graph 1255 represent a tcr of 10 ppm/°C and illustrate the simplifications made in context with MANGANIN® and its parabolic resistance-temperature curves when linear equations are used.

It should be noted however, that the resistance variation with temperature in graph 1255 covers an absolute range of only ±200ppm.

The resistivity of MANGANIN® is specified in DIN 46460. Although resistance-temperature curves for MANGANIN® can lie between the curves 1 and 5, ISA-PLAN®'s process is designed to conform to the space limited by curves 2 and 3.

From the mathematical point of view, the parabolic shape of the resistance-temperature curve is determined by specifying ∂20 and by a coefficient β which determines the spread of the parabola. ∂20 is the temperature coefficient at 20°C. Setting the origin into the maximum, the resistance-temperature curve for MANGANIN® and its possible range can be determined from the formula:

$R_t = R_{20}(1 + \partial_{20}(t-20) + \beta(t-20)^2)$

The range of variations for ∂20 and β is given:

∂_{20} = 0 to = 20 * 10^{-6}

β = approx. $-0.5 * 10^{-6}$

R_t = Resistance at the temperature t

R_{20} = Resistance at the temperature 20°C.

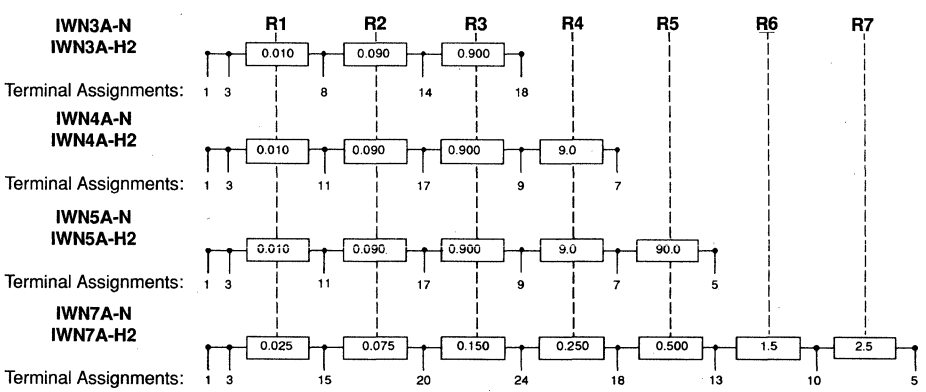
ISA-PLAN® PRECISION RESISTORS

ISA-PLAN® PRECISION CURRENT SHUNT RESISTOR NETWORK



ISA-PLAN® resistor networks were specially designed for application in digital and analog current measuring and regulation devices in which the current has to be very accurately measured and controlled in a range of several orders of magnitude.

ISA-PLAN® has developed networks made out of a precision resistance material without additional connections. Since each resistor element is etched from the same physical section of MANGANIN® foil, the matching of the resistors to each other is unsurpassed in the industry. Using four-terminal termination (Kelvin-technique) the influence of leads and terminals on the resistors is completely eliminated.

FOUR-POLE TECHNIQUE (KELVIN-TERMINATIONS)

In all networks, terminal 1 is the common current connector (I_L) and terminal 3 the common connector for the voltage (E_L). The terminal for the lowest current is both the terminal for current and voltage. In this case, the influence of the very low-ohmic copper connector is almost nil.

ISA-PLAN® PRECISION CURRENT SHUNT RESISTOR NETWORK

ISA-PLAN® HI-POWER, CURRENT SENSING RESISTORS

Type **R** precision resistors are four-terminal (Kelvin devices and are outstanding for their high accuracy at a high power rating. The resistor element is etched from MANGANIN foil carefully aged in a special procedure, which is mounted directly to a 6mm copper plate for optimal dissipation. The heat resistance is below 0.1 K/W. Type R should be mounted on a heat sink whose heat resistance should not be more than 0.1 K/W.

The connectors consist of copper sheet 3mm thick and 50mm wide, thus providing a very low lead resistance and an even current density within the resistor. The current sense terminals are similar to AMP contacts, allowing easy and quick mounting.

REG is a high power, high insulation resistor which has been specially developed for use in RC snubber protection circuits for high current GTO's and thyristors.

REG is designed for a continuous power load of 250 Watts and can withstand instantaneous pulse power up to 2KW. The Manganin resistive element is mounted directly on a ceramic plate that is again bonded on the large copper baseplate. This construction guarantees a very low internal heat resistance of less than 0.1K/W as well as extremely high electrical insulation between resistor and baseplate. The package design maximizes creepage distance between terminals and ground.

Type **RUG** has been designed for applications in which high DC and low frequency AC currents must be measured and regulated with high accuracy and reproducibility. One example is the power supply for superconducting magnets. The RUG resistance element can employ either Zerinan (tcr = 1-3ppm/°C +20°C to +60°C), or Manganin (tcr = 10ppm/°C +20°C to +60°C).

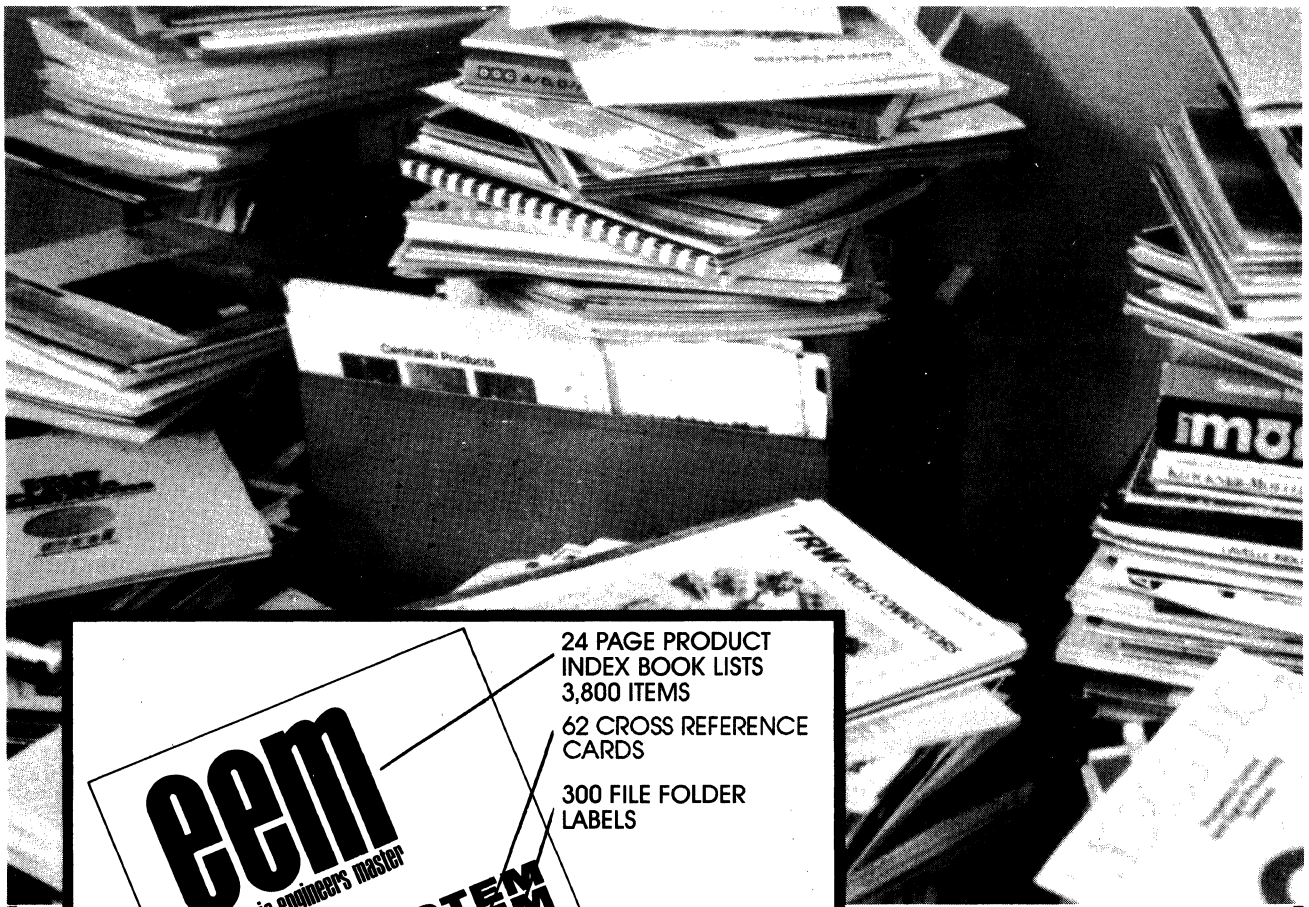
When mounted on a heatsink (water or air cooled) the resistance change which is generated by the temperature increase of the resistance element and its tcr value is negligible.

RUG's package geometry is common to high power transistor modules. The current terminals can be screw-connected with bus-bars or cable connectors via the built-in nuts which are torque secured by the molded case.

BSH is ideal for use in high-current power supplies, UPS equipment and power drive modules for electrical motors.

The BSH resistor is constructed with two 1mm copper-plates that sandwich the isolated manganin resistor element. The resistor is electrically connected to either one of the two copper plates near the terminal holes. This results in a mechanically-rigid construction with a very low heat resistance (<1.5K/Watt). The unique design enables mounting between current rails (bus-bar mounting) which act as a heat sink.

BSH is constructed in a four-terminal (Kelvin) configuration with tab-type terminals (similar to Amp #110) as the sense connectors.



The **RTO** resistor is identical to the SOT-227B 'ISOTOP' package (TO-238). The RTO power resistor is now available for easy mounting with active components on a heat sink. This provides for an effective and low cost assembly of power modules for power supplies and power drives for electrical motors.

Due to the extremely high dielectric withstanding voltage to the base p[late the resistor can be operated at the high side of the a.c. line (i.e. 380 VAC). The RTO is ideal for application as a current sense resistor or as a power resistor in snubber RC-bypass of transistors and thyristors or GTOs.

The heavy copper-leads allow continuous currents up to 150A and short pulse currents to 1500A.

RTO is produced in two-and four-terminal configurations. Single packages with double- or triple-resistors are also available.

KRL
BANTRY COMPONENTS, INC.

KRL's complete product line is now available in Surface Mount Packaging, including: Precision wirewound resistors with temperature coefficients from ±1 PPM to ±10 PPM with tolerances from ±.005% to ±1%; Power Resistors from 1 to 3.5 watts with Wirewound or Metal Oxide elements; Linear Response Temperature Compensating resistors; and Specialty Fuse resistors. While other manufacturers rely on mechanical terminations and connections, KRL has chosen to utilize standard Manufacturing techniques for thru-hole resistors, including Mil-R-93 and Mil-R-26 standards for wirewound resistors and applied them to the production of a surface mountable device. As always, KRL's Application Specialists are available to assist with design criteria for any Surface Mount or Thru-Hole resistive component need.

♣ KRL Temperature Compensating WIRE WOUND RESISTORS

KRL High T.C. Resistors are available in any of the packages listed in this Catalog

RESISTANCE RANGE—10Ω to 5MegΩ

TOLERANCE—Standard from 10%, 5%, 3% and 1%. Accuracies to 0.1% are available. Consult factory for special requirements.

TEMPERATURE RANGE—From −55°C to +145°C

TEMPERATURE COEFFICIENTS—Available from +80PPM/°C to +6000PPM/°C (See Table Right). Use Order Code A thru T for standard T.C.'s shown.

SPECIAL TEMPERATURE COEFFICIENTS—If you need a special...non-standard T.C., use Order Code X and specify the exact T.C. required and temperature range of operation with +25°C as reference temperature. (Factory must approve all non-standard T.C.)

APPLICATIONS—Since there are many packages that a High T.C. Resistor can accommodate, it is impossible to show all types. Most often a customer will have a unique situation and our engineering department will gladly aid in any design and development of customer requirements. KRL High T.C. Resistors have found their way into Power Supplies, Motor Controllers, Computers, Electronic Circuits for D to A and A to D Converters, Temperature Sensors for the Medical Electronics Field, Aircraft Systems, Aerospace Flight Modules, and in Automotive Electronic Ignition Systems.

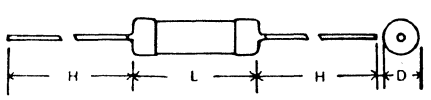
♣ KRL Nonflame Fusible Metal Film Resistors FPR SERIES

FPR Nonflame Fusible Metal Film Resistors



The FPR Nonflame Fusible Metal Film Resistors were designed to limit thermal surge and resulting circuit damage due to excessive voltage. FPR Resistors provide reliable and accurate blow characteristics. The FPR resistors fail in an open mode. These resistors are available in ohmic values from .22 to 100k ohms, and wattage sizes from ¼ to 3 watts.

Various telephone power line, and tip & ring circuits utilize the FPR resistor to protect sensitive parts from lightning strike surges. Other circuits that would benefit from these fusible resistors are inputs that may be exposed to line voltage faults, or power supplies that need current limiting with a safe, nonflame failure mode. Since each circuit has different and custom requirements, KRL/Bantry will work with your engineering staff to choose the correct part for your application.

FEATURES

- Small package size.
- Noncombustible insulating coating.

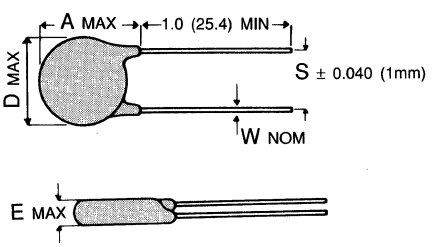
Maida Development Corporation is a domestically owned and operated manufacturer of a wide variety of electronic ceramic components. Since 1947, we have specialized in the custom design and fabrication of ceramic disk capacitors - from ceramic dielectric powder formulation through finished devices - to meet the specific requirements of our customers. Maida's major capacitor products include (1) Class I, Class II, and Class III high voltage disk capacitors, 1 KVDC thru 30 KVDC; (2) capacitors safety-recognized by UL, CSA, and VDE, for across-the-line, line-by-pass, and antenna-coupling applications; (3) close tolerance adjusted NPO disk capacitors; (4) low-inductance leadless disks; (5) slot-mountable "trapezoids" for printed circuits; (6) trimmer capacitors; (7) post insulators/capacitors; (8) radial tubular capacitors; (9) feedthrus and (10) sparkgaps.

Maida Development Company also produces a complete line of metal oxide varistors (MOV's) designed for transient voltage suppression and surge energy absorption. We are now the only U.S. manufacturer of these components, with ceramic formulation, powder preparation, fabrication, and assembly facilities all located in this country. Maida's varistors are recognized by UL, CSA, and VDE. Please contact Maida's Sales Department to request our full-line varistor catalog.



Delivery is both timely and reliable - with either bulk or tape-and-reel packaging.

Our sales representatives are strategically located throughout the USA and the world. Maida welcomes the opportunity to discuss and bid on capacitor requirements not covered by this catalog. Please contact our Engineering Department.

VITREOUS ENAMEL RIBWOUND RESISTORS

BASIC CONSTRUCTION

Crimped ribbon resistance wire is edgewound and then locked to the ceramic core with vitreous enamel. The resistance wire is spot welded to the terminal bands. MRC Ribwounds can be supplied in fixed, adjustable, or tapped styles. Cement or silicone coatings are optional.

HI-OHM RIBWOUNDS AN EXCLUSIVE WITH MRC

In the chart below, note that the maximum ohmic value shown for each wattage is 3 to 4 times higher than that normally available. This development is the result of precision rib winding machines designed specifically by MRC. Unique in the industry, these precision machines produce a winding with extreme uniformity. This allows much closer turns providing significantly higher resistance. Hi-Ohm Ribwounds can replace lower ohmic value round wire power resistors with savings in size.

Many 300 watt units are stocked in both fixed and adjustable styles. Listed are the more popular 300 watt ohmic values. All other wattage ratings and styles are made to order.

APPLICATIONS

Recommended for use where high energy is to be dissipated in the lower ohmic ranges. With its ability to dissipate greater heat, the ribwound resistor is almost one half the physical size of an equally rated roundwire.

Ribwound wattage ratings are based on a temperature rise of 375°C above an ambient of 40°C.

They can be mounted with spring clips (thru 1⅛" dia.); thrubolt hardware individual or multiple-stacked bracket assemblies or live-bracket assemblies.

EDGEWOUND POWER RESISTORS

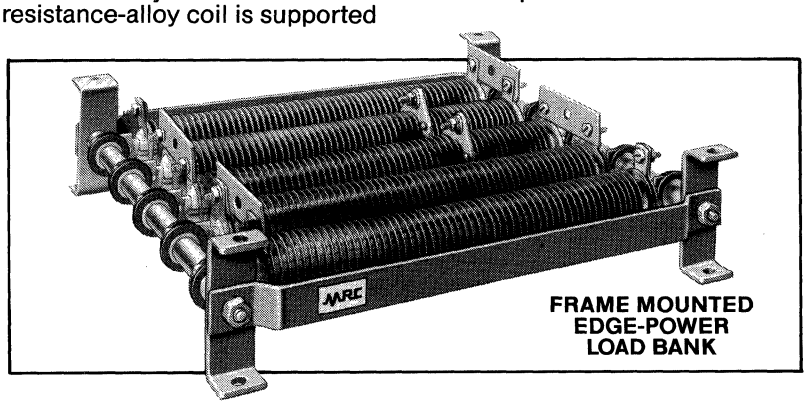
EDGE·POWER

HIGH CAPACITY GOOD WEIGHT/WATTAGE RATIO

New **EDGE-POWER** resistors complement Milwaukee Resistor's roundwire, ribwound and grid resistors which have been the industry's workhorse of electrical power dissipation for many years.



A continuous range of resistor types are now available for your high current applications. EDGE-POWER falls naturally between MRC's ribwound and grid resistors and allows full design versatility from one source.

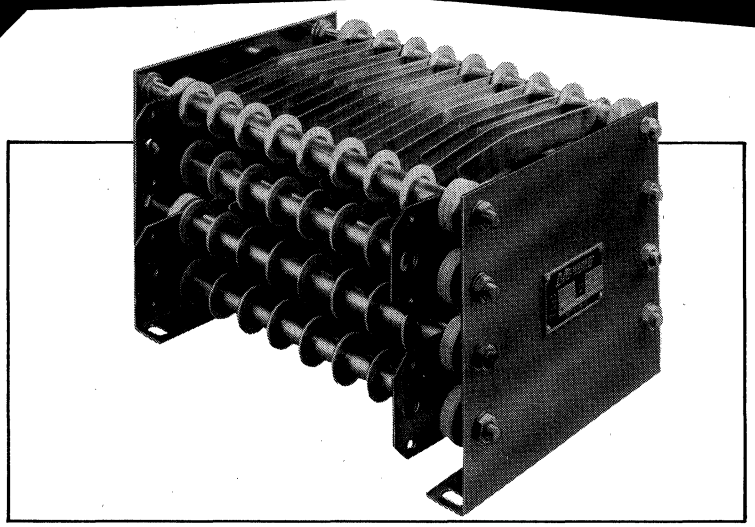
Because of the open coil construction of EDGE-POWER resistors, heat dissipation is efficient, and reasonable surges/overloads are easily accommodated.

The heavy duty resistance-alloy coil is supported on specially designed porcelain insulators which provide insulation and proper turn-to-turn spacing. The end-slot/side-slot support bar provides versatility in mounting and adapts easily to many existing installations.

Movable tap terminals are available as an option. Terminal hardware for cable attachment is provided as a standard item on all terminals and taps.

Frame mounted load banks (as shown below) can be furnished with taps and jumpers to meet your circuit specifications (series, parallel or combination). Your load bank inquiries are invited.

FRAME MOUNTED EDGE-POWER LOAD BANK



Typical Applications of **EDGE-POWER** resistors include motor control (starting, plugging, speed control and braking), load dumping, ballast, current limiting, and voltage dropping. Edgewound resistors are commonly found in:

- Overhead Cranes
- Locomotives
- Lift Trucks
- Plating Baths
- Elevators
- Power Supplies
- Arc and Spot Welders
- Battery Lines/Chargers
- Many Industrial Controls

GRID RESISTORS

...For High Current and High Power Circuits

Milwaukee Grid Resistors are among the most versatile grid resistors developed. They are custom designed with the aid of a computer for specific applications.

Special features that assure longer life include: a patented* grid design that withstands overloads that would destroy conventional grids. Corrosion resistant stainless steel or special alloy elements. All-welded construction to eliminate hot spots and resistance fluctuations. Vibration-proof insulation that allows extended operation at higher voltages.

Taps and independent sections can be easily incorporated into the design to provide added flexibility. MRC grid units can be designed for use with natural convection cooling or with forced ventilation if size reduction is necessary.

They are competitively priced and incorporate more life and greater dependability than usually provided by conventional grid resistors.

MINI-SYSTEMS, INC., thick/thin film chip resistor components are ideally suited for the fabrication of microelectronic circuits where tight resistance tolerance, wide range of resistance values, or short production runs make the conventional screening and firing of thick/thin film resistance networks too costly. MINI-SYSTEMS, INC., chip resistors are made from a carefully engineered selection of materials. Geometries are mechanically precise and uniform. Careful testing and inspection result in the highest quality resistors.

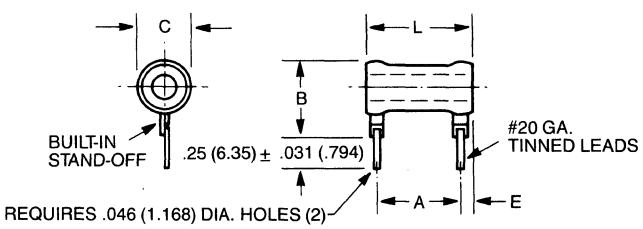
PC-58 Series Radial Lead Power Resistor for PC Boards

- 5% Tolerance
- Vitreous Enamel/Silicone
- PC Board Mounting



Features

- **Radial lead** construction for direct insertion into printed circuit boards; fit standard 0.10 inch matrix boards with standard 0.046 inch diameter holes. Provides a built in stand-off to reduce board temperature.
- **Space saving** radial leads reduce the total length requirement compared to axial lead resistors and increase packaging density possibilities.
- **Flame resistant** vitreous enamel coating.

  Radial-lead resistors are designed specifically for direct insertion into printed circuit boards. Direct insertion reduces manufacturing costs by eliminating the cutting, bending and forming of leads required with axial-lead resistors.

  Radial lead resistors feature all-welded construction to assure stable performance even during heavy usage.

SUPER TIME SAVER!

Do you work with ICs? Do you have trouble finding the IC you need? Are you sick and tired of sifting through dozens of manufacturers' data books? Do you have trouble comparing one set of specs to another? Are you sick and tired of wasting time?

Do we have good news for you! Get your hands on the latest annual copy of the IC Master. The Master will save you both time and money. Here's how.

The Master lists every single IC you can buy. Better yet, the Master lists ICs by function. You know what you want to do. The Master tells you who makes what for what you want to do.

There's more! The Master lists every known alternate source to every integrated circuit. If somebody makes a substitute for an IC, the Master tells you. And fast!

Want to find a custom or semicustom IC? The Master tells you who the manufacturers are, what their capabilities are, and what design tools you need.

Looking for a distributor or a local sales office? The Master tells you where they are. Got a technical problem? The Master tells you who to call. Can't figure out a part number? The Master tells you how the part number systems work.

There's more! The Master has a section on microprocessor development tools with complete performance parameters. There's another section on programmable logic devices giving you everything from output configuration to PLD development systems.

Want to know if there's an application note available on a given part? The Master tells you!

If your question has anything to do with integrated circuits, you need the IC Master. Subscribe now by calling (516) 227-1314. Ask for Marie Botta. Tell Marie you need the Master now.

If you prefer, write to Marie, Hearst Business Communications, 645 Stewart Ave., Garden City, NY 11530. She'll mail you the IC Master subscription form right away.

And, if you tell her you saw it in the 1991/92 EEM, she'll take $10 off the subscription price!

SERIES 9C COMMERCIAL CHIP RESISTORS

SMD (chip) resistors consist of a ceramic body (alumina) on which is deposited resistive paste. Variations in the composition of the paste result in different resistant values. A wrap around termination is deposited at each end of the resistor to allow reflow or wave soldering. The resistive layer is covered with a protective coating to assure mechanical and environmental integrity.

CUSTOMIZED RESISTOR SETS AND NETWORKS

Because of the high consistency and uniformity of the film deposition process and the high, repeatable accuracy of automated trimming equipment, descrete film resistors are available in matched pairs, multivalue sets and discrete networks with high precision and very dependable performance at reasonable cost. Resistance values, tolerances, temperature coefficients, as well as the matching and/or tracking of these parameters, can be specified and meet to exceptionally high degrees. The optimum range for the tightest requirements is 100 ohms thru 100,000 ohms, but 10 ohms thru 1 megohms is a practical range for less stringent requirements.

NOTE:
Cost savings can be realized when relatively tight matching requirements are specified while permitting the absolute parameters of the discrete resistor to have more relaxed specifications.
Application engineers are available to assist you in specifying your requirements in the most economical way possible.
Please contact the factory for complete information.

ENGINEERING DATA:

1 RESISTANCE RANGE AND TOLERANCE "MIL Guidelines"
Standard: Any ohmic value or decimal part of an ohm desired with tolerances to ±0.01%. 10Ω min. res. (.01%).
Special: Higher or lower values beyond the standard limits with tolerances to ±0.005% at calibrated temp. (25°C).

2 TEMPERATURE COEFFICIENT OF RESISTANCE (TCR)
Standard: Zero±5 ppm/°C (100 ohms and above). **Zero ±15 ppm/°C** (values below 100 ohms).
Special: To ±1 ppm/°C. TCR matching to within 0.5 ppm/°C. Please specify temp. span of operation.

3 INDUCTANCE
Standard: Non-inductively wound with balanced reverse pi winding.

4 STABILITY OF CALIBRATION
To ±0.001% (10 ppm) per year at 25°C — no load — regardless of resistance tolerance.

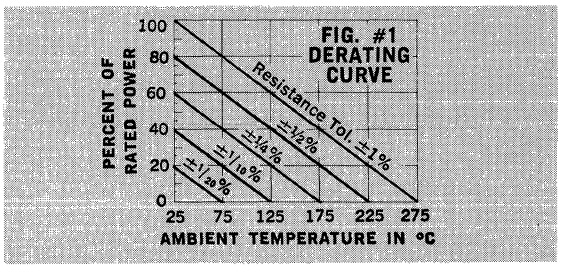
5 POWER RATINGS VS. AMBIENT TEMPERATURE
These resistors are designed for full load operation providing the ambient temperature plus the temperature rise due to power dissipation does not exceed +125°C. (Derated to zero power at +145°C.)

6 HIGH VOLTAGE RATINGS
Type HR-P high operating voltage winding patterns also eliminate dangerous crossovers and potential problems of standard bobbin style resistors. To calculate the safe operating voltage for any resistance value below the maximum listed, apply the formula $E = \sqrt{PR}$.

7 STABILITY VS. THERMAL EMF (With respect to copper terminals)
Standard: <+2 microvolts per °C (100 ohms and above). <−3 microvolts per °C. (values below 100 ohms).

8 PROTECTIVE ENCAPSULATION
Expansion — stress free base coat and epoxy seal. Solder — heat and solvent resistant.

9 MARKING (Identification)
Standard: PRC symbol, type, resistance value and tolerance.
Special: Military or custom marking.



10 TRACEABILITY TO N.I.S.T.
Certification (Absolute values in ohms) to N.I.S.T. is available.

* 0.02 ohm to 0.1 ohm and maximum resistance values available in non-standard physical sizes −0 +.062".
All low value 2-terminal designs are calibrated and tested at mid-point on lead unless otherwise specified.

CONSIDER THESE INNOVATIVE FEATURES:

1 WIDE RESISTANCE RANGE

"Widest in the industry" any ohmic value or decimal part of an ohm from 0.02 ohm to 4 megohms.

2 DEPENDABLE TOLERANCES

Small quantity lots, as well as, competitive high volume production quantities are accurately checked 100% to assure specified limits . . . ±1% (Std.), ±0.5%, ±0.25%, ±0.1% and ±0.05% resistance tolerances.

Call us about your design requirements and questions. Engineering samples are available for testing and evaluation.

3 STABILITY VS. TEMPERATURE CHARACTERISTICS

Carefully selected materials/processes & quality control procedures insure low temperature (TCR) and power coefficients. **Standard:** Zero ±10 ppm/°C 100Ω and above. Zero ± 15 ppm/°C below 100 ohms. **Special** to ±2 ppm.

4 HIGH VOLTAGE RATINGS

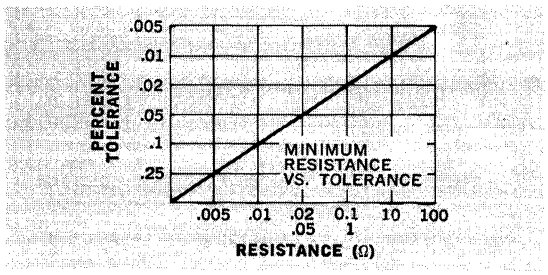
(D.C. Voltage or Peak Voltage)
Precision's high operating voltage winding patterns also eliminate dangerous crossovers and potential problems of standard mandrel style resistors. To calculate the safe operating voltage for any resistance value below the maximum listed, apply the formula $E = \sqrt{PR}$.

5 PRECISION POWER RATINGS

All (Std.) Type SM 1% tolerance resistors are designed for continuous full load operation at 25°C (% Δ under load ≈ .06%/W.). Derate to zero power at +275°C. (Fig. #1)

6 SOLVENT RESISTANT COATING

All Type SM resistors are sealed in a tough solvent resistant—high temperature silicone coating . . . with indelible marking.



7 PURCHASING INFORMATION

Please Specify: Quantity, type, resistance value, resistance tolerance and special features which may apply. TCR characteristic together with temperature span of operation should be specified in behavior spec.

ENGINEERING DATA:

1 RESISTANCE RANGE AND TOLERANCE

Standard: Any ohmic value or decimal part of an ohm desired from 0.015 ohm to 100 ohm with tolerances to ±0.005%.

Special: 0.005 ohm through 0.01 ohm with microhm tolerances to ±0.1%.
(See resistance vs. tolerances graph above)

2 TEMPERATURE COEFFICIENT OF RESISTANCE

Zero ±15 ppm/°C — please specify temperature span of operation.

3 STABILITY VS. TIME CHARACTERISTICS (No Load)

To ±0.001%/year @ 25°C.

4 SOLVENT RESISTANT COATING

. . . with indelible marking.

5 PRECISION POWER RATINGS

Minimum resistance values @ full power ratings are based upon ±1% resistance tolerances at 25°C. Derating is required for higher temperatures, closer tolerances and lower resistance values.

6 TERMINALS

Solderable "hot-tinned" copper wire leads act as an excellent wetting agent and provide long shelf life. Low EMF construction reduces thermal effects. Select any two terminals as current leads (directly or diagonally opposite) and the other two potential leads for voltage drop.

7 TWO TERMINALS VS. FOUR TERMINALS

Two-wire devices are for relatively high values where the effects of lead-out resistance and contact resistance are minimal. Allow approx. +.001 ohm per inch for lead-out resistance on 2-wire designs. Adder may be eliminated by using a 4-terminal resistor for very accurate, repeatable low resistance measurements.

Four-wire circuits will only indicate the voltage drop across the resistor eliminating lead-out and lead-heating errors.

Resistors

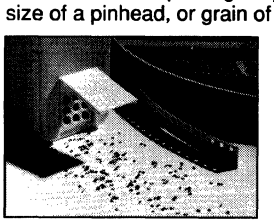
Since the founding of our company almost forty years ago, we have been committed to the idea of quality and reliability being absolutely primary in importance.

ROHM was first in the industry to introduce, and meet, quality levels measurable in parts-per-billion.

Quality is our passion. We breathe it. We live it. And we believe that rigorous, uncompromising product quality results in the greatest possible economy for you.



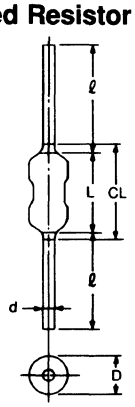
But that doesn't mean we are slow to take on new challenges. Quite the contrary.

ROHM was a pioneer in surface mount technology. Since the introduction of the MCR-18, the original worldwide standard for chip resistors, ROHM has introduced a broad range of new surface mount components. These include standard-setting chip resistors ranging from .063W to 1W with 1% or 5% tolerance levels.

And now we're introducing a totally new geometry to resistive component packaging.

Smallest-Ever Chip Resistor

Our newest package is just about the size of a pinhead, or grain of pepper.



Measuring 1.0 x 0.5mm, the tiny MCR-01 occupies 60% less surface area than the MCR-03, formerly the industry's smallest chip resistor. The MCR-01 weighs 75% less than the larger part.

Rated power for the new package is 0.032W (1/32W) at 70°C, with a maximum operating voltage of 12.5V. Resistance range is 5.6L to 1.5ML; tolerance is ±5%. Opera-ting temperatures range from -55°to +125°C.

Call us for complete specifications on chips, fixed resistors, resistor networks and resistor arrays.

PART NUMBERING SYSTEM

Our part numbering system is explained on the right. As an example, we show the part number of our standard production; passivated; 50 x 40-mil chip; with pretinned nickel barrier wrap-around terminations, 15 ohm ± 5%. The part number is S0504CPX150J:

PACKAGING

Standard production resistors are bulk packed in anti-static bags. High reliability units are packed in anti-static "waffle pack" chip trays. Tape and reel packaging is available for sizes 0504 and larger.

HIGH RELIABILITY SCREENING

State of the Art can supply chip resistors with optional high reliability screening. Any size or style can be processed and tested in a manner that will meet specific high reliability needs. Our standard product could serve as a starting base to which special testing or 100% screening can be added. This can be in accordance with MIL-R-55342 with the addition of Group A and B screening.

If in doubt about the proper codes, or if there is more information than the part number allows, use plain language.

Surface Mount Resistor Networks

State of the Art produces a variety of surface mount resistor and resistor/capacitor networks. These devices feature thick film materials on alumina substrates, providing good thermal management and electrical stability. The standard "lead" configuration is a pretinned wrap-around with NICKEL BARRIER, offering excellent resistance to leaching in rigorous soldering applications such as reflow and vapor phase. For high volume applications where maximum economy is needed, top surface only terminations are available.

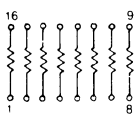
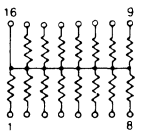
CUSTOM DESIGNS

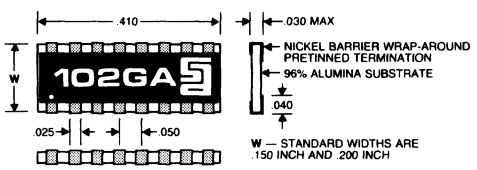


State of the Art can produce a variety of custom network designs for surface mount applications. Using the SLAMDIP, JEDEC, or non-JEDEC style substrates, the individual resistors can be altered to suit the need; other resistance patterns can be applied — limited only by what can be put into the available space.

We can also produce other substrate designs. Custom length, width, and "lead" configuration can be provided. Please contact State of the Art's engineering department for information and quotations.



SLAMDIP RESISTOR NETWORK



When State of the Art's "SLAM DIP" resistor network replaces individual chip resistors, you will save space and reduce your placement labor. Other benefits, such as better tracking and lower board cost, may also develop.

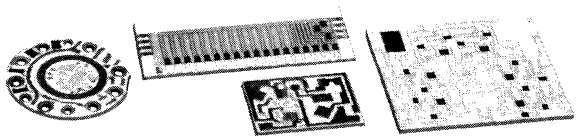
JEDEC LCCC RESISTOR AND RESISTOR/CAPACITOR NETWORKS



Having a maximum profile height of .030" (resistor circuits only), these packages are ideal in circuits where small size and low head space is needed. Limited only by the available space, almost any conductor, resistor or resistor/capacitor circuit can be placed on these substrates. Our 20 I/O configuration is shown below, but a wide variety of sizes is available.

ICMASD...IC Alternate Source Directory

The all new 1991 version of the world famous Alternate Source Directory is now available in floppy disk form for your IBM XT & AT and 100% compatible personal computer with hard drive.

The **1991 ICMASD** contains the more than 180,000 listings that appear in the Alternate Source Directory Section contained in Volume Two of the printed version of the 1991 IC Master ...plus additional discontinued parts. The database includes complete vendor addresses and phone numbers.

You can personalize the **ICMASD** for your application. The program allows you to add comments, up to 20 digits long, to each listing. These comments can be part numbers, prices, or any information specific to your needs. You may also add, delete and/or discontinue devices!

For greater flexibility the base number search feature enables you to access parts by base number, i.e., the device number stripped of prefixes and suffixes. You don't need to know the manufactures codes to call up any of the alternates to these devices.

The **1991 ICMASD** is fast, convenient and very user friendly!

Complete program documentation is included. When ordering, be sure to specify if you want the **1991 ICMASD** on three, double-sided, double-density disks OR on one high-density disk.

For immediate delivery you can order the **1991 ICMASD** at $179.50* simply by charging your Visa or MasterCard credit card. To place your order or for more information, call or write:

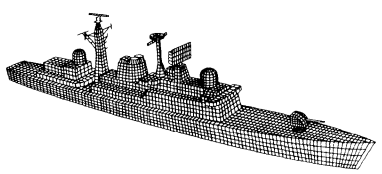
A COMPANY OF VISHAY BULK METAL® RESISTORS

Bulk Metal®Foil Military Resistors



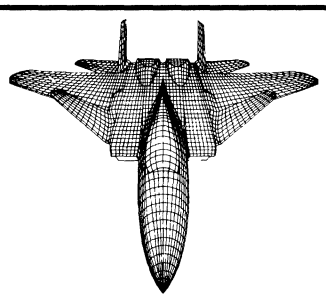
Established Reliability

- TCR: ±2.5 ppm/°C (–55°C to +125°C)
- Load Life Stability: 0.015% (150 ppm) ΔR for 10,000 hrs.
- Shelf Life: 0.0025% (25 ppm) for 3 yrs.
- Voltage Coefficient: <0.1 ppm/V
- Current Noise: –32dB
- Thermal EMF: 0.05 μV/°C

At the cutting edge of today's advanced technology, military programs (such as the space shuttle and the sky lab, satellites, SDI, the Aegis, MK48, missiles and military aviation like the F18) often require established-reliability precision resistors beyond the level of existing military specifications. VISHAY can take the basic generic military resistor, and, with specific testing, offer improved performance specifications such as are detailed here below.

RNC90Y
MIL-R-55182/9

(See Catalog VMF-2000)



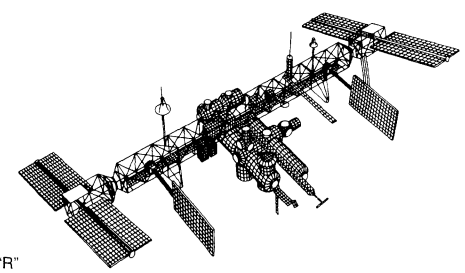
The VISHAY RNC90Y (S555) resistor is qualified to the "R" reliability level for resistance values from 4.99Ω through 121KΩ and for tolerances from ±0.005% to ±1.0%. VISHAY has accumulated over 160 million unit hours of testing on the RNC90Y resistor. The VISHAY RNC90Y high-performance resistors are designed for both the critical military systems market and for demanding industrial applications.

The same resistors are also available as a non-qualified product (S555) for customers desiring extended resistance range. Both the qualified and the non-qualified version are manufactured on the same product line facilities and are subjected to the same process, lot control, conditioning, and basic QPL testing requirements.

The VISHAY RNC90Y resistor is approved to MIL-STD-975D (NASA). It is also manufactured and packaged to comply with ESD requirements.

M122/1
MIL-R-122

(See Data Sheet VMF-300)



The VISHAY M122/1 (S22-1) resistor is qualified to the "R" reliability level for resistance values from 4.99Ω through 50KΩ and for tolerances from ±0.005% to ±1.0%. VISHAY M122/1 high-performance resistors are designed for both the critical military systems market and for demanding industrial applications.

The same resistors are also available as a non-qualified product (S22-1) for customers desiring extended resistance range. Both the qualified and the non-qualified version are manufactured on the same product line facilities and are subjected to the same process, lot control, conditioning, and basic QPL testing requirements.

The VISHAY M122/1 resistor is manufactured and packaged to comply with ESD requirements.

VISHAY
Improved Performance Testing (IPT)

(Contact Application Engineering Dept.)

VISHAY also provides the basic MIL resistors with specific conditioning to ensure improved long term stability. This specific conditioning could include:

- Thermal Shock
- Specific Burn In Cycles
- Short Time Overload

The guaranteed level of the Improved Performance Testing (IPT) Specifications are shown below.

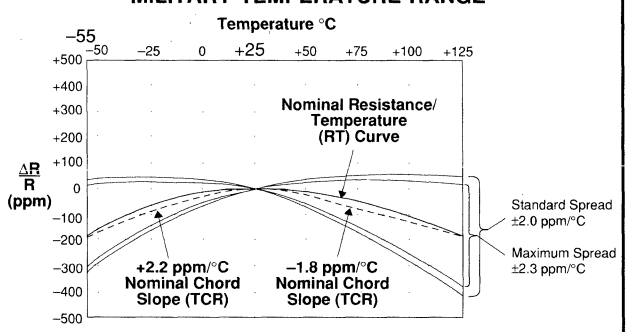
Bulk Metal® Foil Precision Surface Mount Chip Resistors

- TCR: ±0.6 ppm/°C
- Tolerance: to 0.01%
- Very High Stability
- Designed to Exceed Requirements of MIL-R-55342



VISHAY VSM resistors offer an order-of-magnitude improvement in performance over other surface mounted chip resistors. Until now, the best chips available had a ±50 ppm/°C (−55°C to +125°C) Temperature Coefficient of Resistance (TCR); the VISHAY chips, however, exhibit a nominal TCR of only +2.2 ppm/°C over the temperature range of −55°C to +25°C and −1.8 ppm/°C from +25°C to +125°C. The VISHAY standard TCR spread from nominal is ±2.0 ppm/°C over the full temperature range. This TCR characteristic is accomplished automatically without selection and regardless of the date of manufacture — even if years apart! Selected TCR tracking is available to 0.5 ppm/°C. Where other chip resistors are, at best, supplied only as close as ±0.1% resistance tolerance, VISHAY surface mounted chips have standard resistance tolerances to ±0.01%.

VISHAY surface mounted precision chip resistors exhibit performance which dramatically exceeds the requirements of MIL-R-55342. In Trident passivation tests, VISHAY chips repeatedly showed no deterioration when exposed to destructive ceric ammonium nitrate solutions (three 15 second etches), indicating a high order of protection and absence of "nichrome migration."

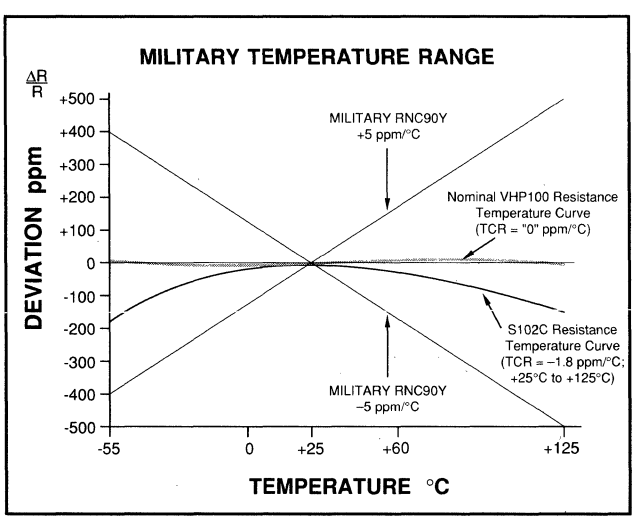
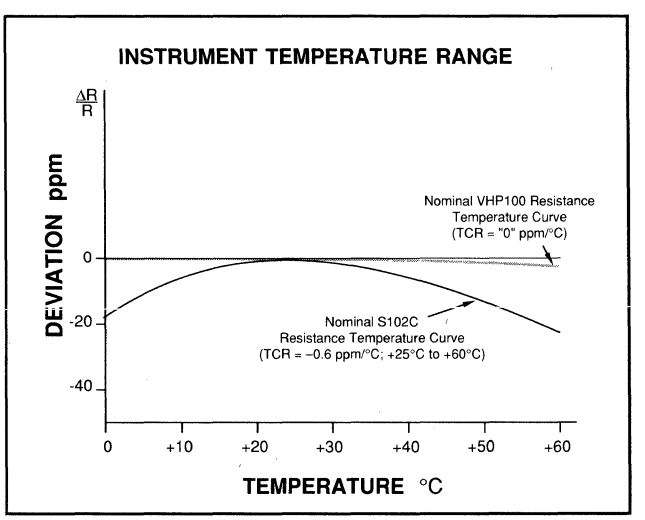
VHP-100, the New Improved VISHAY Resistor with Self-Correcting Resistance versus Temperature Performance



- Essentially Zero TCR
- No Humidity Effect
- Lowest Thermal EMF in the Industry
- Excellent Stability
- Essentially Non-Inductive Performance



VISHAY has achieved an essentially zero temperature coefficient resistor. By combining equal and opposite temperature effects, resistance changes due to temperature are kept to a minimum, to the extent that the resistance deviation of the Model VHP100 resistor remains within a 60 ppm window over the military temperature range from –55°C to +125°C.

BULK METAL® RESISTORS

Precision, Hermetically-Sealed, Miniature TOs, DIPs and Other Packages

Product Capabilities

- Ratio tolerance to 0.0025%
- TCR tracking to 0.5 ppm/°C combined with absolute TCR of 1.0 ppm/°C — virtually not affected by temperature gradients
- Ratio stability under load-life conditions better than 10 ppm
- Rise time to 1 nanosecond, no ringing
- Noise better than -32dB
- Hermetically sealed

The Precision Resistor Network Division of VISHAY manufactures products that add a new dimension of performance to Bulk Metal® Foil technology.

Smaller package sizes, tighter resistance matches, closer tracking and high stability are all achieved when foil chip resistors are bonded into a ceramic DIP or metal enclosure and hermetically sealed.

VISHAY's Precision Resistor Network products are based on fabrication from a standing inventory of packages and resistor chips. This permits quick delivery of prototypes since there are no masks to design or trial processings to be made. Further, it allows any combination of values, tolerances and circuits. There are normally no engineering or setup charges, and no minimum quantities are required. Delivery can be in as few as five days.

The sequence of fabrication includes selection of chips, die attachment, wirebonding, value trimming, and hermetic sealing. The finished product provides the stability associated with foil resistors in a hermetically sealed miniature package.

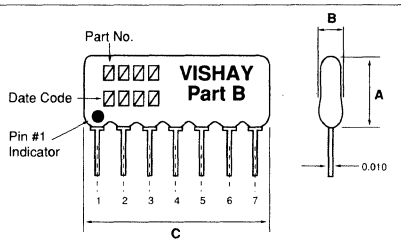
A COMPANY OF VISHAY BULK METAL® RESISTORS

R/2R Ladder Combined Technology Networks



Gives a specified performance at lowest possible price.

- Networks in thick, thin, and foil technologies.
- Networks in SIP, DIP, and hermetic packages.
- 1/2 LSB accuracy from 5 to 15 bits.
  1 LSB accuracy — 16 bits.
- Temperature compensated.
- R = 1K, 10K or 100K.

When resistors are grouped in an array, with access to various bit switches, their electrical schematic appears to look like a ladder — hence, the name "ladder networks".

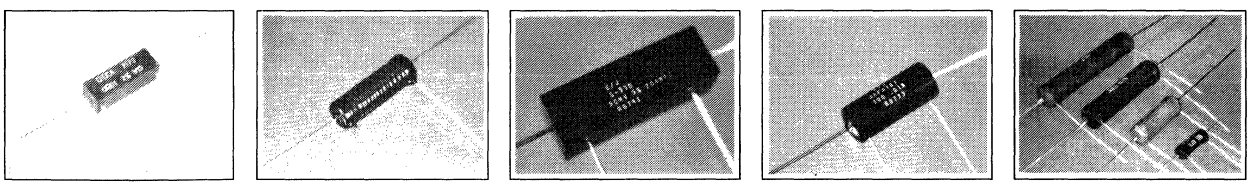
Precision Current Sensors

Tight Tolerance — Low TCR



Axial Leaded Current Sensors

Radial Leaded Current Sensors

Axial/Radial Leaded Current Sensors

Precision Current Sensors are not normally considered high current devices. For high current and power devices, refer to EEM section 2900, Precision Current Shunts, VISHAY Electronic Components Group.

From the various VISHAY Electronic Components Group's facilities around the world, comes a range of products based on resistive foil, wire, thin film and thick film technologies. Precision current sensors from 0.005 Ω to "K" range values are available in a variety of four terminal configurations. Tolerances of ±0.001% are available, depending upon the device and resistance values. TCR as low as ±1 ppm/°C is available over limited temperature ranges.

Both thin film and thick film technologies are available in chip form with sub-ohmic values and four terminal wrap-around terminations.

† A rheostat is a two-terminal variable resistor. When both ends of the resistance element and the slider contact (three terminals) are used, it's called a potentiometer . By tradition, nevertheless, power variable resistors are often referred to as rheostats, no matter how used.

PRECISION CO-MOLDED CONDUCTIVE PLASTIC POTENTIOMETERS & ASSEMBLIES

The JDK Co-Molded Conductive Plastic Process

JDK manufactures one type of potentiometer element — co-molded conductive plastic — because, to the designer and builder of systems in critical applications, there is no justification to use less than the best. In the JDK process, the termination and resistance materials are simultaneously molded with the plastic substrate. The result is a flush circuit with a very hard, smooth surface which, when combined with JDK's multifinger precious metal contacts, promotes ultra-long life, as well as excellent electrical performance in all environments. The superiority of the JDK flush circuit over the raised circuit elements (i.e., conductive plastic film, screened conductive plastic, cermet, hybrid, and wirewound) is most evident in its long-term consistent performance and reliability.

THE JDK DIFFERENCE

Since the JDK process and systems are foremost in the industry, we are able to offer the following features:

- ULTRA-LONG ROTATIONAL LIFE — 50 million cycles minimum for most applications of 6000 & 6200 models
- STATE-OF-THE-ART OUTPUT SMOOTHNESS — always under 0.1%
- NO INTERNAL SOLDER CONNECTIONS — conductive epoxy and welded connections used for greater reliability
- LOW TORQUE — less than 0.1 in oz. available in most single cup 6000 & 6200 models
- 18 MONTH WARRANTY — standard for most applications of 6000 & 6200 models
- OUTSTANDING VALUE = best "price/performance" ratio in the industry
- ALL UNITS DESIGNED, MANUFACTURED, AND TESTED IN ACCORDANCE WITH MIL-R-39023

PRECISION WIREWOUND SINGLE TURN POTENTIOMETERS

PST

The wirewound family of precision single turn potentiometers provides a level of quality that has become an industry standard. Designed for applications that require extreme accuracy and high reliability, they meet or exceed most applicable military specifications. They are ideal for laboratory equipment and as standards for test bench applications. The unique design of the wiper assembly provides back-lash free operation.
The housings are machined from aluminum, brass or stainless steel. Shafts are ground and polished 303 stainless steel with either brass sleeve or precision ball bearings.
These combinations provide close linearity tolerances and high repeatability for a relatively moderate environment.

PRECISION CONDUCTIVE-PLASTIC SINGLE TURN POTENTIOMETERS

PST

These conductive plastic potentiometers have been specially designed for severe environmental conditions in mill-factory operations as well as in critical military applications. The molded, raised track maintains itself free from contamination of foreign particles, oil or water. The high gram pressure of the graphite composition contact on the raised track gives excellent resistance to contact bounce under punishing vibration or shock, as well as an exceptional rotational life. Such units are particularly suited for applications where trouble-free maintenance is required.

HEAVY DUTY LINEAR MOTION POTENTIOMETERS WIREWOUND AND CONDUCTIVE PLASTIC **HDL**

WIREWOUND M2028 This transducer combines the inherent accuracy and reliability of a wirewound potentiometer with the physical ruggedness required in industrial applications. They are used with hydraulic and mechanical actuators to measure and control linear motion. The self-aligning spherical ball ends and MS connector simplifies installation. High duty bearings give the ¼ inch shaft stability in the extended position.

CONDUCTIVE PLASTIC P1991 Where severe environmental conditions exist as in mills, factories and power generating plants, this linear motion transducer is practically indestructible. The unit is impervious to dust, oil and moisture. The molded, raised conductive track and graphite composition contacts provide for years of maintenance free service. As with the M2028, the self-aligning spherical ball ends and MS connector allows for ease in installation.

LIGHT DUTY LINEAR MOTION POTENTIOMETERS WIREWOUND AND CONDUCTIVE PLASTIC

LDL

WIREWOUND (M-Series) These miniature transducers combine the best electrical characteristics in the smallest size at the lowest cost. The units were designed for use in laboratory test equipment, light industrial applications and automation where great accuracy of electrical output is essential. The spherical ball ends add flexibility to mounting. These wirewound, linear motion potentiometers will meet the requirement in the majority of applications.

CONDUCTIVE PLASTIC (P-Series) Where long life in a hostile environment is required, these linear motion transducers with molded, raised tracks and graphite composition contacts have no equal. They are practically impervious to dust, water and oil. The high contact pressure resists the effects of severe vibration and shock. The units are being used in factories and mills where maintenance-free operation is essential.

MOTORIZED POTENTIOMETERS AND SWITCHES

MPS

General Description & Applications

A family of single turn and multiturn, motor driven potentiometers and switches has been developed for industrial servo applications. They are used for such applications as variable speed controls on power generating sets, electrical-mechanical remote control, and readouts. They provide excellent accuracy at an economical price. These integrated motor-potentiometers are the result of years of Maurey experience in the manufacture of precision potentiometers and motor assemblies. The potentiometers, gear head, clutch, and motor are precisely matched to perform to exacting specifications. Motor-clutch-pot units are available in a wide range of specifications. A motor of selected speed and voltage may be matched with single, 3, 5, or 10 turn potentiometers, either wirewound or conductive plastic. When multiple voltages are required, single cups may be conveniently ganged with or without clutches. In addition, Maurey engineers can provide multi-tap potentiometers, special shafts and mountings, and a wide range of AC or DC motors to your specification.

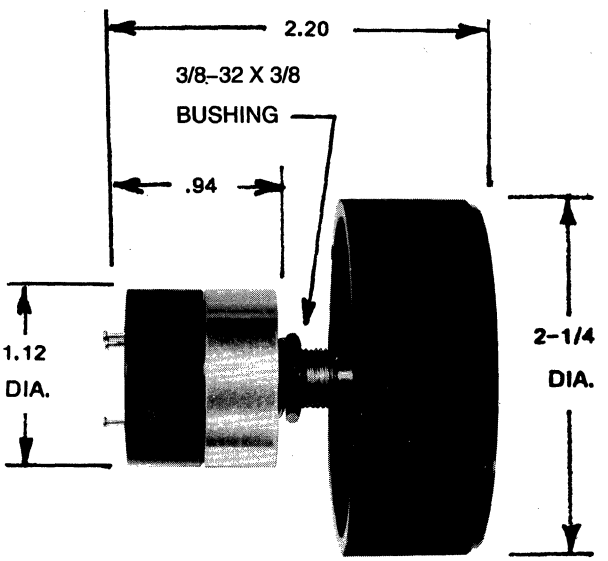
SINGLE AXIS JOYSTICK CONTROLS WITH POTENTIOMETER — SAJ

The type SAJ single axis joystick control is the ideal choice for those industrial applications where a single plane of travel is to be controlled. Such devices are used to control the speed of a single motor, or to determine the back and forth motion of a hydraulic or pneumatic cylinder.



Both units are spring return to center for zero reference. They are available with either lever type or rotary actuator and will adapt to almost any mounting configuration. The bushing type potentiometer facilitates installation.

The precision conductive plastic potentiometer uses the unique Maurey rased molded track, resulting in almost unlimited life. In addition, this design insures that the potentiometer is impervious to moisture, oil, dust and industrial gases.

The coin silver collector rings and precious metal contacts provide long life and low noise operation for instrumentation use. The collector ring/brush sets can be stacked or "pancaked" for multiple application. These units are particularly useful where there is limited axial width.

With a wide variety of diameter and bore sizes available, the SR2300 is ideal for strain gage and thermocouple measurements where rotating data circuits must be monitored.

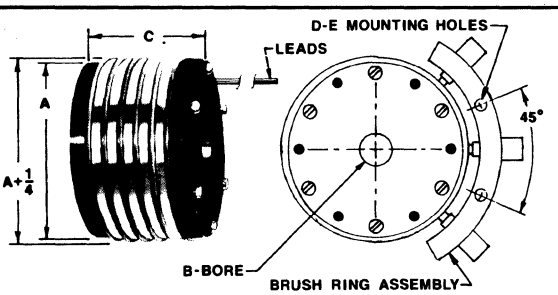
Std. bore sizes: 1/2", 5/8", 3/4"

The SR2066 totally enclosed slipring assembly is used for industrial and military applications where low signal noise is essential. Enclosed ball bearings support coin silver rings with gold-platinum alloy brushes.

Aluminum housing with O-ring seals, effectively protects the rings and brushes from the environment.

Manufacturers of industrial equipment requiring signal feedback and low current input rely upon this precision slipring for long life and trouble free service. They are used in laboratory instrumentation, fire control, meteorological circuits and for numerous automation applications.

ROTARY TYPE SLIPRINGS



The SR2310, SR2460 and SR2495 standard sliprings fill a need for a low cost yet highly reliable means of medium power and signal transfer to and from a rotating shaft.

Two standard assemblies are used, a rotary slipring with 4 to 12 conductors and a stationary brush block assembly providing 2 contacts per ring. The slipring assembly is mounted on the rotating shaft. The brush assembly is attached to the machine by 4 screws. Long life precious metal contacts and coin silver rings insure low noise signals and conducts 2 amperes. Noise level: 50 millohms, Dielectric Strength: 750 volts RMS for 60 sec., Leads: AWG 22, PVC. 12" long, Contacts per ring: 2.

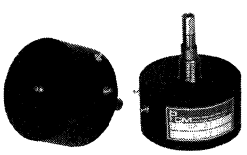
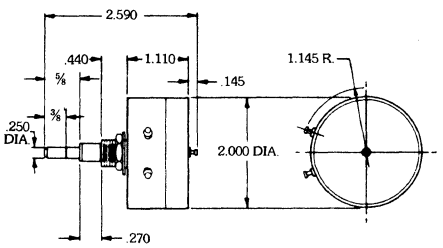
HIGH RESOLUTION VERNIER POTENTIOMETERS



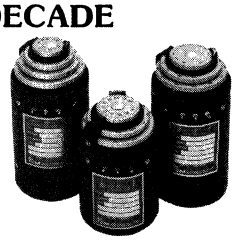
Models 23A and 24A Vernier potentiometers feature high and very high resolution because of their unique design. Coupled both electrically and mechanically, they allow any fixed portion of the coarse element (5% or less) to be expanded over the 270° of shaft rotation on the vernier. Total rotation is 555° (1.5 turns) and a 5% vernier presents a resolution roughly equivalent to a 3600° (10 turn) model; a 2.5% vernier is about equivalent to a 7200° (20 turn) model; a 1% vernier is approximately equivalent to a 18000° (50 turn) model.



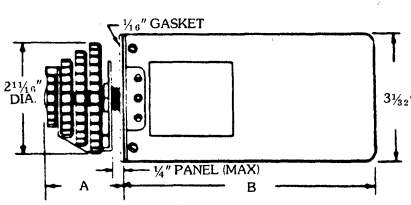
Customized products are available with modified shafts. R_t (total resistance), tolerance, P_v (vernier percentage), and torque. Please consult the factory with your unique requirements.

All PCM potentiometers are wire wound; standard values are from 100 ohms to 100K ohms ±3%.

We sell quality and service and we stand behind what we sell.



DOUBLE VERNIER POTENTIOMETERS

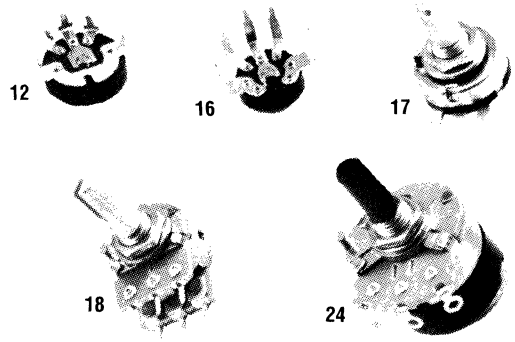


For applications requiring extremely high resolution, the Model 30A Vernier Potentiometer provides 0.002% or better resolution in less than 2½ turns of the shaft. The 30A does not rely on gear ratios to achieve mechanical resolution, but through a unique patented design, provides true electrical resolution which is roughly equivalent to 40 turn potentiometers. The vernier contacts span any 5% of the main winding and expand it over the 280° rotation of the first vernier. Any 5% segment of the first vernier is in turn expanded over the 270° rotation of the second vernier. Thus extreme resolution is possible in only 830° of total shaft rotation.

HIGH ACCURACY DECADE POTENTIOMETERS AND RHEOSTATS

Precision Control Mfg., Inc. (PCM) produces high quality, coaxial dial decade potentiometers and rheostats for high accuracy applications. The basic design features a positive in-line readout and easy, rapid adjustment made possible by a combination of distinct dials and a parallax free indicator. The unique electrical and mechanical design of PCM decades makes a small and accurate package which is very rugged.

Decade potentiometers provide linearities ranging from ±0.005% in the model 50A to ±0.0025% in the model 60A. All PCM rheostats have an accuracy base of ±0.025%.



All PCM decades are available in militarized versions which meet or exceed the environmental portions of MIL-E-5272C, Sections 4.2.2, 4.3.1, 4.4, 4.6 through 4.11.2, 4.12, 4.15 and MIL-T-945A, Sections 4.4.1 through 4.6. Resistors used in PCM decades are wound with only premium resistance alloys for low temperature coefficients and are single layer wound, with low inductance making possible precision attenuation over a wide range of frequencies. Switch decks utilize low leakage materials and feature gold plated silver contacts. The case is heavy gauge aluminum to provide shielding and dust protection, shafts are of stainless steel.

FOR THE JAPANESE, *SHOKAI* MEANS INTRODUCTION

WHAT DOES *SHOKAI* MEAN FOR YOU? (HINT: IT MAKES YOUR IDEAS PROFITABLE)

Let's face it. As a source for electronic and electromechanical components, the quality and pricing of the Far East can't be matched on our side of the ocean. But you can't go to the Far East whenever you need to source a product.

That's why, if up to now, your knowledge of Japanese was limited to "sushi" and "sayonara", we respectfully suggest that you learn another word . . . SHOKAI®. . . Your introduction to the Far East.

SHOKAI® is an American company, with over 30 years experience manufacturing and importing components from the Far East. We were serving American manufacturers long before everybody with a fax machine and a foreign telephone book could claim to be an overseas supplier. And we will be here long after they are gone.

We speak your language. We understand you - your time frames - your requirements - your problems – the quality and personal attention you and your customers demand. As hundreds of "Top 500" companies have learned, let SHOKAI® be your source for components from Japan, Taiwan, Hong Kong and the rest of the Far East.

OUR PRODUCT LINE INCLUDES:

- AC/DC Adaptors
- Antennas
- Battery Holders
- Buzzers
- Cable Assemblies
- Capacitors
- Cassette Mechanisms
- Circuit Breakers
- Connectors
- Fuses and Holders
- Lamps
- LCD's
- LED's
- Lenses
- Microphones
- Microphone Cartridges
- Mirrors
- Opto-electronics
- Panel Meters
- Piezo Elements
- Potentiometers
- Resistors
- Speakers
- Switches
- Tape Heads
- Transformers

And many more. Try us. You can start by requesting a catalog. Let us know what product you're looking for. Or better yet, tell us exactly what you want. You won't be disappointed.

Why don't you use your new word as soon as possible. You won't have to eat raw fish to try it. Just pick up your phone. We're waiting for your call.

When reliability is critical...

Tocos examines the performance of its products long after their sale, through the widely used FIT, or failure rate in the field methodology. Of the one-hundred million units of our GF06 series produced over a 7-year span, **less than 1ppm failed** for a 0.06 (FIT) failure rate in the field.

eem MINIGLOSSARY THYRISTORS/ HIGH POWER DIODES

THYRISTORS

A thyristor is a four-layer semiconductor (pnpn) that can be switched from an OFF to an ON state. This is usually done by a voltage or current pulse to the gate terminal. The device will then continue to conduct so long as the principal current of the device flows through the thyristor's two main terminals.

In many respects a thyristor is analogous to an electromechanical latching relay. In fact, thyristors have largely replaced these relays in newer equipment designs. But, misapplications and/or failure to fully understand the parameters of these and other solid state devices often leads to catastrophic field failures.

The terminology shown on this page has been condensed from common industry data books and is intended to be a guide for the engineer.

di/dt: *Critical rate of rise of ON state current* is the user's maximum design limit (Fig. 1).

di_R/dt: *Rate of decay of ON state current* (Fig. 1 & 2).

dv/dt (critical): *Rate of rise of OFF state voltage*. Lowest voltage rate of rise to cause a thyristor to turn ON.

dv/dt (reapplied) : *Rate of rise of reapplied OFF state voltage.*

I_{FSM}: *Nonrepetitive ON state surge current in diodes.* Maximum peak value of ½ cycles (60 Hz) a diode can withstand up to 100 times in its lifetime.

I_{TSM}: *Nonrepetitive ON state surge current in thyristors*. Maximum peak value of 60 Hz cycles a thyristor can withstand up to 100 times in its lifetime.

I_{DRM}/I_{RRM}: *Maximum peak forward/ reverse leakage current* at specified temperature and repetitive conditions.

Powerex Technology Has Produced the Best Selection of Rugged and Design-Adaptable Power Modules Available Today.

Like our isolated INTELLIMOD™, which features combined components to allow easy integration, and to reduce circuit design costs, allowing you to get your product to market in half the time. INTELLIMOD™ offers fail-safe protection against excess currents, temperatures, undervoltage lock, and short circuits. Rated 10-20A/600V.

Then there's our family of IGBT isolated modules. Powerex IGBTs outperform the competition by 10-15% in even the harshest environments. Features like square switching, large safe-operating area, reduced steady-state switching, and increased short circuit withstand time, make Powerex IGBT's the natural choice for applications that call for maximum durability. Designed for 15-20 Khz operation with ratings to 15-600A/600-1400V.

Innovative Transistor Packages

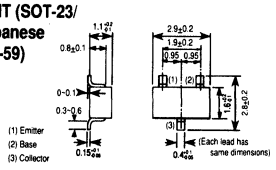
In the past decade, ROHM has pioneered the development of several surface mount and through-hole transistor packages.

Innovations include the development of the digital transistor, a space-saving device that includes two resistors and one transistor in a single surface mount package.

To enhance the possibilities inherent within the industry-standard SOT-23 package outline, ROHM has developed the SOT-25 with five leads and the SOT-36 with six. This design allows a dual digital transistor arrangement, including both resistors and transistors in a single package.

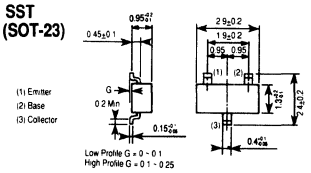
We offer single and dual digital transistors in several device configurations and resistance values. Please call for complete specifications.

ROHM's also has developed the SOT-89 and DPAK packages incorporating an exclusive lock-in mechanism for the power tab that prevents separation from the base. The locking feature eliminates the incursion of moisture, which is otherwise a threat to reliability.



ROHM pioneered the development of thermally isolated TO-126 and TO-220 packages. This electrically isolated, thermally conductive solution eliminates microwashers and thermal grease, and also allows more efficient heat sink mounting of power transistors.

In addition, we have developed semiconductor package innovations which improve automated handling of these devices. Both the FTR and ATR packages have flat corners, which accommodate automatic insertion without taping.



Call us for all your discrete semiconductor requirements, including surface mount, leaded, digital and dual digital transistors, transistor arrays, and dual digital transistor arrays.

A Reputation for Reliability

Over the past 20 years, ROHM often has set the industry's standards for quality and reliability in discrete semiconductors.

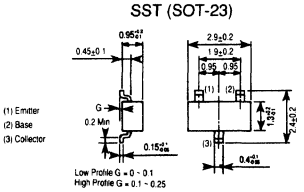
Quality is our passion. We breathe it. We live it. And we believe that rigorous, uncompromising product quality results in the greatest possible economy for you.

ROHM also has earned a reputation as an innovative packaging company. We were among the first to put leadless diodes into production. Today, our leadless diode product line is among the world's most extensive.

When rectifier users encountered excessive wear on lead-forming equipment, ROHM responded by supplying easier-to-bend 0.6mm leads on DO-41 products.

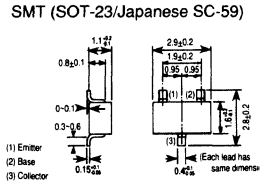
Similarly, to allow mounting of diodes on 5mm centers flush with PC boards, ROHM provided the solution with preformed axial/radial tape-and-reel DO-34 diodes.

So in discrete semiconductors, when quality and innovation are the questions, ROHM is the answer.



New SST Package

If you're now using SC-59 diodes, you should consider ROHM's new super-slim SST package. It has a smaller overall size, and allows you to increase board density.



The SST's dimensions match those of many popular European part numbers. It fits the pad layout of existing boards using these components.
