0000     27 ;
0000     28 ; REVISION HISTORY
0000     29 ;
0000     30 ; 00-01 Tom Groetzinger 4-FEB-1980
0000     31 ;       Started file.
0000     32 ;
0000     33 ; 00-02 Dave Spain      27-FEB-1980
0000     34 ;       Added CS BUS INTEGRITY test.
0000     35 ;
0000     36 ; 00-03 Tom Groetzinger 12-MAR-1980
0000     37 ;       Added five tests.
0000     38 ;
0000     39 ; 00-04 Tom Groetzinger 17-MAR-1980
0000     40 ;       Added SRK,SRM callouts to some tests.
0000     41 ;
0000     42 ; 00-05 Tom Groetzinger 17-MAR-1980
0000     43 ;       Improved tests 7 and 16 to increase coverage due to Westboro feedback
0000     44 ;
0000     45 ; 00-06 Tom Groetzinger 17-MAR-1980
0000     46 ;       Debugged test 16 dueu to major rewrite
0000     47 ;
0000     48 ; 00-07 Tom Groetzinger 17-MAR-1980
0000     49 ;       Added 9 Super Rotator tests
0000     50 ;
0000     51 ; 01-08 Dave Spain       4-APR-80
0000     52 ;       Added 4 Micro-sequencer tests for offical release.
0000     53 ;
0000     54 ; 01-09 Bill Landry     4-APR-1980
0000     55 ;       Added the XB, PREFETCH and IRD tests from ECKAC.SRC so
0000     56 ;       manufacturing can run one tape for DPM.
0000     57 ;
0000     58 ; 00-10 Bill Landry     4-APR-1980
0000     59 ;       Let's save version 1.0 for our first SDC release.
0000     60 ;
0000     61 ; 00-11 Tom Groetzinger 7-APR-1980
0000     62 ;       Added 2 ALK Tests
0000     63 ;
0000     64 ; 00-12 Tom Groetzinger 8-APR-1980
0000     65 ;       Deleted last 2 D Register outputs from ALK Test #6
0000     66 ;
0000     67 ; 00-13 Tom Groetzinger 14-APR-1980
0000     68 ;       Added D Register output to ALK test #6
0000     69 ;
0000     70 ; 00-14 Dave Spain      25-APR-1980
0000     71 ;       Changed mask on the micro-sequencer tests to ignore bit 13 of the
0000     72 ;       Control Store address.
0000     73 ;
0000     74 ; 00-15 Dave Spain      28-APR-1980
0000     75 ;       Fixed bug in ALK Tests 6 and 7 by replacing VSIZE/1 micro order with a
0000     76 ;       SIZE[LONG] macro in micro words 6 and 3 respectively.
0000     77 ;
0000     78 ; 00-16 Dave Spain      29-APR-1980
0000     79 ;       Changed mask on CS address for Instruction Address Decode test from
0000     80 ;       3FFF to 1FFF to ignore bit 13 of Control Store address.
```

```
0000     81 ;
0000     82 ; 00-17 Dave Spain      30-APR-1980
0000     83 ;       Added CCS module to error callout for Control Store Bus Integrity test.
0000     84 ;
0000     85 ; 00-18 Dave Spain       9-MAY-1980
0000     86 ;       Added SRM gate array to error callout routine in RTMP0 and RTEMP
0000     87 ;       Sratchpad tests.
0000     88 ;
0000     89 ; 00-19 Bill Landry     10-JUN-1980
0000     90 ;       Added RDM tests to beginning of tape
0000     91 ;
0000     92 ; 01-00 Bill Landry/Dave Spain  13-JUN-1980
0000     93 ;       Added macro file to title section and compatibility mode IRD tests
0000     94 ;       then submitted to RELEASE ENGINERRING.
0000     95 ;
0000     96 ; 01-01 Dave Spain      19-JUN-1980
0000     97 ;       Fixed prefetch incrementer test to clear out cache data after every
0000     98 ;       prefetch. This will prevent the test from mistaking bad addresses from
0000     99 ;       good ones.
0000    100 ;
0000    101 ; 01-02 Dave Spain       2-JUL-1980
0000    102 ;       Added CM Second IRDX tests to file.
0000    103 ;
0000    104 ; 01-03 Dave Spain      18-AUG-1980
0000    105 ;       Added CM branch test to file.
0000    106 ;
0000    107 ; 01-04 Dave Spain      10-SEPT-1980
0000    108 ;       Fixed "DEFAULT MTEMP0 TEST"
0000    109 ;
0000    110 ; 01-05 Bill Landry     11-SEPT-1980
0000    111 ;       Revised RDM to CMI tests
0000    112 ;
0000    113 ; 02-00 Dave Spain      28-SEPT-1980
0000    114 ;       Added rotator tests to file and submitted to SDC.
0000    115 ;
0000    116 ; 02-01 Dave Spain      28-OCT-1980
0000    117 ;       Added QV flag to tests to be run by manufacturing.
0000    118 ;
0000    119 ; 02-02 Bill Landry     10-NOV-1980
0000    120 ;       Added tests for TOK and SAC gate arrays.
0000    121 ;
0000    122 ; 02-03 Bill Landry     13-NOV-1980
0000    123 ;       Added test of REI CHECK
0000    124 ;
0000    125 ; 03-00 Dave Spain      17-NOV-1980
0000    126 ;       Added rotator tests 23-28 and released to SDC.
0000    127 ;
0000    128 ; 03-01 Dave Spain      10-DEC-1980
0000    129 ;       Added rotator tests 29-42.
0000    130 ;
0000    131 ; 03-02 Bill Landry     11-DEC-1980
0000    132 ;       Fixed bug in CS ADDRESS test
0000    133 ;
0000    134 ; 03-03 Dave Spain      12-DEC-1980
0000    135 ;       Enhanced Rotator Test 1 to call out ALP slices.
0000    136 ;
0000    137 ; 03-04 Bill Landry     16-DEC-1980
```

```
0000    138 ;       Added DSIZE ROM tests
0000    139 ;
0000    140 ; 03-05 Bill Landry     31-DEC-1980
0000    141 ;       Last great act of 80. Separated DPM and RDM tests into two files.
0000    142 ;
0000    143 ; 04-00 Bill Landry     5-JAN-1981
0000    144 ;       Submitted to RELEASE ENGINERRING
0000    145 ;
0000    146 ; 04-01 Bill Landry     14-JAN-1981
0000    147 ;       Revised INTERVAL TIMER INTERRUPT TEST to fix bug caused by INT PEND
0000    148 ;       ECO
0000    149 ;
0000    150 ; 04-02 Dave Spain      16-JAN-1981
0000    151 ;       Fixed error callout in CS Parity Error, XB, and Prefetch Incrementer
0000    152 ;       tests and added seven new rotator tests.
0000    153 ;
0000    154 ; 04-03 Bill Landry     4-FEB-1981
0000    155 ;       Added tests for CCC gate array
0000    156 ;
0000    157 ; 04-04 Dave Spain      9-FEB-1981
0000    158 ;       Changed the names of rotator tests 23-33.
0000    159 ;
0000    160 ; 04-05 Bill Landry     24-FEB-1981
0000    161 ;       Added tests for DPM discrete branching logic.
0000    162 ;
0000    163 ; 04-06 Bill Landry     27-FEB-1981
0000    164 ;       Added tests for branching logic in PHB gate array.
0000    165 ;
0000    166 ; 05-00 Dave Spain       1-MAR-1981
0000    167 ;       Added 5 SRK status rotator tests and submitted to SDC.
0000    168 ;
0000    169 ; 05-01 Dave Spain      25-MAR-1981
0000    170 ;       Fixed a loop on test bug in the Alu Functions Test by adding a LDFIELD
0000    171 ;       pseudo-op that reinitializes the ROT field in Subtest 1.
0000    172 ;
0000    173 ; 05-02 Bill Landry     25-MAR-1981
0000    174 ;       Fixed bug in BUT/NO.FPA test.  I was branching on the wrong conditions.
0000    175 ;
0000    176 ; 05-03 Dave Spain      14-APR-1981
0000    177 ;       Cleaned up documentation for R Scratchpads Write All Cells Test.
0000    178 ;
0000    179 ; 06-00 Bill Landry     2-MAY-1981
0000    180 ;       Added SPA branching, CON registers, TU58 registers, and CCS PARITY
0000    181 ;       tests.  Submitted to Release Engineering.
0000    182 ;
0000    183 ; 06-01 Dave Spain      17-JUN-1981
0000    184 ;       Replaced the old IRD1 Instruction Address Decode test with two new
0000    185 ;       tests that toggle the PSL's FPD bit and can handle an FPA.
0000    186 ;
0000    187 ; 06-02 Bill Landry     19-AUG-1981
0000    188 ;       Fixed bugs created by introduction of FPA option.
0000    189 ;       Replaced all references to COMET with the word CPU.
0000    190 ;       Fixed typing error in vbus data of CPU CLOCK TEST.
0000    191 ;       Submitted to RELEASE ENGINEERING.
0000    192 ;
0000    193 ; 06-03 Bill Landry     24-SEPT-1981
0000    194 ;       Fixed potential clock problem with FPA in Z BIT TEST 1.
```

```
0000   195 ;
0000   196 ; 06-04 Bill Landry     9-OCT-1981
0000   197 ;       Added changes for ECO L0002-TW002
0000   198 ;
0000   199 ; 07-00 Bill Landry     31-OCT-1981
0000   200 ;       Removed changes for ECO L0002-TW002.  ECO is on hold.
0000   201 ;       Added tests for FPA to CPU interface logic
0000   202 ;       Moved WCS test to MIC tape
0000   203 ;       Submitted to RELEASE ENGINEERING.
0000   204 ;
0000   205 ; 07-01 Bill Landry     13-NOV-1981
0000   206 ;       Stopped release of 7.0
0000   207 ;       Added FPA TRAP LOGIC TEST
0000   208 ;       Enhanced error messages for FPA
0000   209 ;       Resubmitted to RELEASE ENGINEERING
0000   210 ;
0000   211 ; 07-02 Bill Landry     20-NOV-1981
0000   212 ;       Stopped release of 7.1
0000   213 ;       Enhanced FPA ENABLE/DISABLE TEST to check for MSEQ INIT
0000   214 ;       Resubmitted to RELEASE ENGINEERING
0000   215 ;
0000   216 ; 07-03 Dave Shull      26-Mar-1982
0000   217 ;       Added the ERRLOOP pseudo to the Rotator Extract tests which were
0000   218 ;       missing these and couldn't be looped on.
0000   219 ;
0000   220 ; 07-04 Dave Shull      05-Apr-1982
0000   221 ;       Removed all BEGINSA and ENDSA pseudo's.
0000   222 ;       Submitted to RELEASE ENGINEERING
0000   223 ;
0000   224 ; 07-05 Dave Shull      21-May-1982
0000   225 ;       Add a subtest to the Micro Sequencer Stack Test that will test bits
0000   226 ;       11 and 12 of the micro stack.
0000   227 ;
0000   228 ; 07-06 Dave Shull      24-May-1982
0000   229 ;       Changed documentation in the CM Odd Address BUT Test to reflect the
0000   230 ;       ECO L0002-TW002
0000   231 ;
0000   232 ; 08-00 Dave Shull      18-Jun-1982
0000   233 ;       Added 10 new tests.  Two of those tests are an addition to the existing
0000   234 ;       IRD1 rom tests.  These 2 new tests check the signal ROM OS INH H.
0000   235 ;       The other 8 new tests check the validity of the IRDX ROMs.  They check
0000   236 ;       both the address and the signal ROM OS INH H.
0000   237 ;
0000   238 ; 08-01 Dave Shull      22-Jun-1982
0000   239 ;       Added a subtest to the Register Backup Stack test that will check the
0000   240 ;       bit that records Increment/Decrement of the GPR.
0000   241 ;
0000   242 ; 09-00 Dave Shull      03-Nov-1982
0000   243 ;       Added two new Tests for coverage the new PCS (L0008) module.
0000   244 ;
0000   245 ; 09-01 Dave Smith      15-May-1983
0000   246 ;       Correct DCS in ALK test 3,6,7. Disabled ALP's on the WBUS.
0000   247 ;
0000   248 ; 09-02 Joe Zagarella   20-Jan-1987
0000   249 ;       Fixed bug introduced by L0003-YA module in tests CE-D3, and D6-DB
0000   250 ;--

0000     5 ; Revision History
0000     6 ;
0000     7 ; 28    Dave Spain      22-Jun-82
0000     8 ;       Removed LOAD FPA SIGN REG and LOAD FPA SIGN REGS macros.
0000     9 ;       Decided not to use them.
0000    10 ;
0000    11 ; 27    Dave Spain      15-Jun-82
0000    12 ;       Added LOAD FPA SIGN REG and LOAD FPA SIGN REGS macros.
0000    13 ;
0000    14 ; 26    Dave Spain      19-May-82
0000    15 ;       Added M[]_FPA macro.
0000    16 ;
0000    17 ; 25    Rich Lewis      23-Feb-82
0000    18 ;       Added PSL_WB, M[]_R[].OR.NIB0(M), WB_FPA CCR, WB_FPA TCR, Q_R[].ASL.P,
0000    19 ;       RDM_M[].XZ.OR.R[], FPA_WB macros
0000    20 ;
0000    21 ; 24    Dave Spain      02-Feb-82
0000    22 ;       Added FPA_R[]+M[] macro.
0000    23 ;
0000    24 ; 23    Bill Landry     22-OCT-81
0000    25 ;       Added PSL_RDM macro
0000    26 ;
0000    27 ; 22    Dave Spain       5 Oct 81
0000    28 ;       Added RDM_FPA and FPA_M[] FPA_RDM macros.
0000    29 ;
0000    30 ; 21    Bill Landry     29 Sept 81
0000    31 ;       Added FPA macro, FPA_M[] FPA_R[].
0000    32 ;
0000    33 ; 20    Dave Spain      14 Aug 81
0000    34 ;       Added the TESTFPA [] macro.
0000    35 ;
0000    36 ; 19    Dave Spain      18 July 81
0000    37 ;       Added the following FPA macros, FPA_RDM and FPA_R[].
0000    38 ;
0000    39 ; 18    Dave Spain      24 Sept 80
0000    40 ;       Added RDM_Q macro. This macro uses the ALU.
0000    41 ;
0000    42 ; 17    Bill Landry     23 Sept 80
0000    43 ;       Added macro VA_VA-ZLIT0[] for testing memory in decending order.
0000    44 ;
0000    45 ; 16    Dave Spain      27 August 80
0000    46 ;       Changed RDM_Q macro to RDM_Q Q_D. This more accurately reflects macro.
0000    47 ;
0000    48 ; 15    Bill Landry     4 June 80
0000    49 ;       Deleted BUS/PRB.RD.PTE from macro CLRTB.VA_VA and CLRCH.VA_VA to
0000    50 ;       satisfy validity checks.
0000    51 ;
0000    52 ; 14    Dave Spain      23 May 80
0000    53 ;       Added BUS/PRB.RD.PTE to the clear cache and clear TB macros for Mr.
0000    54 ;       Bill.
0000    55 ;
0000    56 ; 13    Dave Spain      14 Apr 80
0000    57 ;       Added SIZE[] or VSIZE/1 to some macros. This allows version 65 of
0000    58 ;       the COMET micro-code defines to run.
0000    59 ;
```

```
0000     60 ; 12    Bill Landry      1 Apr 80
0000     61 ;       Added BUS/PRB.RD micro order to RDM_TB macro to compensate for timing
0000     62 ;       problem in ADD gate array.  This is not an APRIL FOOL!
0000     63 ;
0000     64 ; 11    Dave Spain       27 Mar 80
0000     65 ;       Fixed TB macro's to include MSRC/VA to prevent validity failure.
0000     66 ;
0000     67 ; 10    Bill Landry      19 Mar 80
0000     68 ;       Added Q_R[].RL.P and VA_Q.OR.R[]
0000     69 ;
0000     70 ; 09    Bill Landry      19 Mar 80
0000     71 ;       Deleted TB_R[].RL.P.OR.D
0000     72 ;
0000     73 ; 08    Bill Landry      18 Mar 80
0000     74 ;       Added VA_R[].RL.P
0000     75 ;
0000     76 ; 07    Bill Landry      07 Mar 80
0000     77 ;       Added Q_M[].RL.PTE
0000     78 ;
0000     79 ; 06    Dave Spain       06 Mar 80
0000     80 ;       Changed TB_R[].RL.P macro to TB_R[].RL.P.OR.D.
0000     81 ;
0000     82 ; 05    Dave Spain       03 Mar 80
0000     83 ;       Added TB_R[].RL.P macro for Bill Landry.
0000     84 ;
0000     85 ; 04    Dave Spain       22 Feb 80
0000     86 ;       Added CLRTB.VA_R[] macro for Bill Landry.
0000     87 ;
0000     88 ; 03    Dave Spain       30 Jan 80
0000     89 ;       Added Tom Groetzinger's macro definitions.
0000     90 ;
0000     91 ; 02    Dave Spain       30 Jan 80
0000     92 ;       Added Tony Vezza's macro definitions.
0000     93 ;
0000     94 ; 01    Dave Spain       29 Jan 80
0000     95 ;       Macros initiated.

Pass 2	32	00:00:01.11	00:00:01.92
Symbol table output	0	00:00:00.12	00:00:00.22
Psect synopsis output	0	00:00:00.01	00:00:00.01
Cross-reference output	0	00:00:00.00	00:00:00.00
Assembler run totals	1131	00:00:04.41	00:00:08.89

The working set limit was 2048 pages.
28279 bytes (56 pages) of virtual memory were used to buffer the intermediate code.
There were 20 pages of symbol table space allocated to hold 285 non-local and 0 local symbols.
747 source lines were read in Pass 1, producing 10 object records in Pass 2.
23 pages of virtual memory were used to define 2 macros.

Macro library statistics

Macro library name	Macros defined
DISK$UCODPACK00:[VAX750]COMETMAC.MLB;1	2
SYS$COMMON:[SYSLIB]STARLET.MLB;2	0
TOTALS (all libraries)	2

552 GETS were required to define 2 macros.

There were no errors, warnings or information messages.

0000     26 ; DPM MICRO-DIAGNOSTIC PACKAGE
0000     27 ;
0000     28 ; REVISION HISTORY
0000     29 ;
0000     30 ; 00-01 Tom Groetzinger 4-FEB-1980
0000     31 ;       Started file.
0000     32 ;
0000     33 ; 00-02 Dave Spain      27-FEB-1980
0000     34 ;       Added CS BUS INTEGRITY test.
0000     35 ;
0000     36 ; 00-03 Tom Groetzinger 12-MAR-1980
0000     37 ;       Added five tests.
0000     38 ;
0000     39 ; 00-04 Tom Groetzinger 17-MAR-1980
0000     40 ;       Added SRK,SRM callouts to some tests.
0000     41 ;
0000     42 ; 00-05 Tom Groetzinger 17-MAR-1980
0000     43 ;       Improved tests 7 and 16 to increase coverage due to Westboro feedback
0000     44 ;
0000     45 ; 00-06 Tom Groetzinger 17-MAR-1980
0000     46 ;       Debugged test 16 dueu to major rewrite
0000     47 ;
0000     48 ; 00-07 Tom Groetzinger 17-MAR-1980
0000     49 ;       Added 9 Super Rotator tests
0000     50 ;
0000     51 ; 01-08 Dave Spain       4-APR-80
0000     52 ;       Added 4 Micro-sequencer tests for offical release.
0000     53 ;
0000     54 ; 01-09 Bill Landry     4-APR-1980
0000     55 ;       Added the XB, PREFETCH and IRD tests from ECKAC.SRC so
0000     56 ;       manufacturing can run one tape for DPM.
0000     57 ;
0000     58 ; 00-10 Bill Landry     4-APR-1980
0000     59 ;       Let's save version 1.0 for our first SDC release.
0000     60 ;
0000     61 ; 00-11 Tom Groetzinger 7-APR-1980
0000     62 ;       Added 2 ALK Tests
0000     63 ;
0000     64 ; 00-12 Tom Groetzinger 8-APR-1980
0000     65 ;       Deleted last 2 D Register outputs from ALK Test #6
0000     66 ;
0000     67 ; 00-13 Tom Groetzinger 14-APR-1980
0000     68 ;       Added D Register output to ALK test #6
0000     69 ;
0000     70 ; 00-14 Dave Spain      25-APR-1980
0000     71 ;       Changed mask on the micro-sequencer tests to ignore bit 13 of the
0000     72 ;       Control Store address.
0000     73 ;
0000     74 ; 00-15 Dave Spain      28-APR-1980
0000     75 ;       Fixed bug in ALK Tests 6 and 7 by replacing VSIZE/1 micro order with a
0000     76 ;       SIZE[LONG] macro in micro words 6 and 3 respectively.
0000     77 ;
0000     78 ; 00-16 Dave Spain      29-APR-1980
```

```
0000     79 ;       Changed mask on CS address for Instruction Address Decode test from
0000     80 ;       3FFF to 1FFF to ignore bit 13 of Control Store address.
0000     81 ;
0000     82 ; 00-17 Dave Spain      30-APR-1980
0000     83 ;       Added CCS module to error callout for Control Store Bus Integrity test.
0000     84 ;
0000     85 ; 00-18 Dave Spain       9-MAY-1980
0000     86 ;       Added SRM gate array to error callout routine in RTMP0 and RTEMP
0000     87 ;       Sratchpad tests.
0000     88 ;
0000     89 ; 00-19 Bill Landry     10-JUN-1980
0000     90 ;       Added RDM tests to beginning of tape
0000     91 ;
0000     92 ; 01-00 Bill Landry/Dave Spain  13-JUN-1980
0000     93 ;       Added macro file to title section and compatibility mode IRD tests
0000     94 ;       then submitted to RELEASE ENGINERRING.
0000     95 ;
0000     96 ; 01-01 Dave Spain      19-JUN-1980
0000     97 ;       Fixed prefetch incrementer test to clear out cache data after every
0000     98 ;       prefetch. This will prevent the test from mistaking bad addresses from
0000     99 ;       good ones.
0000    100 ;
0000    101 ; 01-02 Dave Spain       2-JUL-1980
0000    102 ;       Added CM Second IRDX tests to file.
0000    103 ;
0000    104 ; 01-03 Dave Spain      18-AUG-1980
0000    105 ;       Added CM branch test to file.
0000    106 ;
0000    107 ; 01-04 Dave Spain      10-SEPT-1980
0000    108 ;       Fixed "DEFAULT MTEMP0 TEST"
0000    109 ;
0000    110 ; 01-05 Bill Landry     11-SEPT-1980
0000    111 ;       Revised RDM to CMI tests
0000    112 ;
0000    113 ; 02-00 Dave Spain      28-SEPT-1980
0000    114 ;       Added rotator tests to file and submitted to SDC.
0000    115 ;
0000    116 ; 02-01 Dave Spain      28-OCT-1980
0000    117 ;       Added QV flag to tests to be run by manufacturing.
0000    118 ;
0000    119 ; 02-02 Bill Landry     10-NOV-1980
0000    120 ;       Added tests for TOK and SAC gate arrays.
0000    121 ;
0000    122 ; 02-03 Bill Landry     13-NOV-1980
0000    123 ;       Added test of REI CHECK
0000    124 ;
0000    125 ; 03-00 Dave Spain      17-NOV-1980
0000    126 ;       Added rotator tests 23-28 and released to SDC.
0000    127 ;
0000    128 ; 03-01 Dave Spain      10-DEC-1980
0000    129 ;       Added rotator tests 29-42.
0000    130 ;
0000    131 ; 03-02 Bill Landry     11-DEC-1980
0000    132 ;       Fixed bug in CS ADDRESS test
0000    133 ;
```

```
0000    134 ; 03-03 Dave Spain      12-DEC-1980
0000    135 ;       Enhanced Rotator Test 1 to call out ALP slices.
0000    136 ;
0000    137 ; 03-04 Bill Landry     16-DEC-1980
0000    138 ;       Added DSIZE ROM tests
0000    139 ;
0000    140 ; 03-05 Bill Landry     31-DEC-1980
0000    141 ;       Last great act of 80. Separated DPM and RDM tests into two files.
0000    142 ;
0000    143 ; 04-00 Bill Landry     5-JAN-1981
0000    144 ;       Submitted to RELEASE ENGINERRING
0000    145 ;
0000    146 ; 04-01 Bill Landry     14-JAN-1981
0000    147 ;       Revised INTERVAL TIMER INTERRUPT TEST to fix bug caused by INT PEND
0000    148 ;       ECO
0000    149 ;
0000    150 ; 04-02 Dave Spain      16-JAN-1981
0000    151 ;       Fixed error callout in CS Parity Error, XB, and Prefetch Incrementer
0000    152 ;       tests and added seven new rotator tests.
0000    153 ;
0000    154 ; 04-03 Bill Landry     4-FEB-1981
0000    155 ;       Added tests for CCC gate array
0000    156 ;
0000    157 ; 04-04 Dave Spain      9-FEB-1981
0000    158 ;       Changed the names of rotator tests 23-33.
0000    159 ;
0000    160 ; 04-05 Bill Landry     24-FEB-1981
0000    161 ;       Added tests for DPM discrete branching logic.
0000    162 ;
0000    163 ; 04-06 Bill Landry     27-FEB-1981
0000    164 ;       Added tests for branching logic in PHB gate array.
0000    165 ;
0000    166 ; 05-00 Dave Spain       1-MAR-1981
0000    167 ;       Added 5 SRK status rotator tests and submitted to SDC.
0000    168 ;
0000    169 ; 05-01 Dave Spain      25-MAR-1981
0000    170 ;       Fixed a loop on test bug in the Alu Functions Test by adding a LDFIELD
0000    171 ;       pseudo-op that reinitializes the ROT field in Subtest 1.
0000    172 ;
0000    173 ; 05-02 Bill Landry     25-MAR-1981
0000    174 ;       Fixed bug in BUT/NO.FPA test.  I was branching on the wrong conditions.
0000    175 ;
0000    176 ; 05-03 Dave Spain      14-APR-1981
0000    177 ;       Cleaned up documentation for R Scratchpads Write All Cells Test.
0000    178 ;
0000    179 ; 06-00 Bill Landry     2-MAY-1981
0000    180 ;       Added SPA branching, CON registers, TU58 registers, and CCS PARITY
0000    181 ;       tests.  Submitted to Release Engineering.
0000    182 ;
0000    183 ; 06-01 Dave Spain      17-JUN-1981
0000    184 ;       Replaced the old IRD1 Instruction Address Decode test with two new
0000    185 ;       tests that toggle the PSL's FPD bit and can handle an FPA.
0000    186 ;
0000    187 ; 06-02 Bill Landry     19-AUG-1981
0000    188 ;       Fixed bugs created by introduction of FPA option.
```

```
0000   189 ;       Replaced all references to COMET with the word CPU.
0000   190 ;       Fixed typing error in vbus data of CPU CLOCK TEST.
0000   191 ;       Submitted to RELEASE ENGINEERING.
0000   192 ;
0000   193 ; 06-03 Bill Landry     24-SEPT-1981
0000   194 ;       Fixed potential clock problem with FPA in Z BIT TEST 1.
0000   195 ;
0000   196 ; 06-04 Bill Landry     9-OCT-1981
0000   197 ;       Added changes for ECO L0002-TW002
0000   198 ;
0000   199 ; 07-00 Bill Landry     31-OCT-1981
0000   200 ;       Removed changes for ECO L0002-TW002.  ECO is on hold.
0000   201 ;       Added tests for FPA to CPU interface logic
0000   202 ;       Moved WCS test to MIC tape
0000   203 ;       Submitted to RELEASE ENGINEERING.
0000   204 ;
0000   205 ; 07-01 Bill Landry     13-NOV-1981
0000   206 ;       Stopped release of 7.0
0000   207 ;       Added FPA TRAP LOGIC TEST
0000   208 ;       Enhanced error messages for FPA
0000   209 ;       Resubmitted to RELEASE ENGINEERING
0000   210 ;
0000   211 ; 07-02 Bill Landry     20-NOV-1981
0000   212 ;       Stopped release of 7.1
0000   213 ;       Enhanced FPA ENABLE/DISABLE TEST to check for MSEQ INIT
0000   214 ;       Resubmitted to RELEASE ENGINEERING
0000   215 ;
0000   216 ; 07-03 Dave Shull      26-Mar-1982
0000   217 ;       Added the ERRLOOP pseudo to the Rotator Extract tests which were
0000   218 ;       missing these and couldn't be looped on.
0000   219 ;
0000   220 ; 07-04 Dave Shull      05-Apr-1982
0000   221 ;       Removed all BEGINSA and ENDSA pseudo's.
0000   222 ;       Submitted to RELEASE ENGINEERING
0000   223 ;
0000   224 ; 07-05 Dave Shull      21-May-1982
0000   225 ;       Add a subtest to the Micro Sequencer Stack Test that will test bits
0000   226 ;       11 and 12 of the micro stack.
0000   227 ;
0000   228 ; 07-06 Dave Shull      24-May-1982
0000   229 ;       Changed documentation in the CM Odd Address BUT Test to reflect the
0000   230 ;       ECO L0002-TW002
0000   231 ;
0000   232 ; 08-00 Dave Shull      18-Jun-1982
0000   233 ;       Added 10 new tests.  Two of those tests are an addition to the existing
0000   234 ;       IRD1 rom tests.  These 2 new tests check the signal ROM OS INH H.
0000   235 ;       The other 8 new tests check the validity of the IRDX ROMs.  They check
0000   236 ;       both the address and the signal ROM OS INH H.
0000   237 ;
0000   238 ; 08-01 Dave Shull      22-Jun-1982
0000   239 ;       Added a subtest to the Register Backup Stack test that will check the
0000   240 ;       bit that records Increment/Decrement of the GPR.
0000   241 ;
0000   242 ; 09-00 Dave Shull      03-Nov-1982
0000   243 ;       Added two new Tests for coverage the new PCS (L0008) module.
```

```
0000   244 ;
0000   245 ; 09-01 Dave Smith      15-May-1983
0000   246 ;       Correct DCS in ALK test 3,6,7. Disabled ALP's on the WBUS.
0000   247 ;--
0000     1          .SBTTL  ""

```
0000     3          .SBTTL  "DIAGNOSTIC MICROCODE MACROS"
0000     4 ;++
0000     5 ; Revision History
0000     6 ;
0000     7 ; 28    Dave Spain      22-Jun-82
0000     8 ;       Removed LOAD FPA SIGN REG and LOAD FPA SIGN REGS macros.
0000     9 ;       Decided not to use them.
0000    10 ;
0000    11 ; 27    Dave Spain      15-Jun-82
0000    12 ;       Added LOAD FPA SIGN REG and LOAD FPA SIGN REGS macros.
0000    13 ;
0000    14 ; 26    Dave Spain      19-May-82
0000    15 ;       Added M[]_FPA macro.
0000    16 ;
0000    17 ; 25    Rich Lewis      23-Feb-82
0000    18 ;       Added PSL_WB, M[]_R[].OR.NIB0(M), WB_FPA CCR, WB_FPA TCR, Q_R[].ASL.P,
0000    19 ;       RDM_M[].XZ.OR.R[], FPA_WB macros
0000    20 ;
0000    21 ; 24    Dave Spain      02-Feb-82
0000    22 ;       Added FPA_R[]+M[] macro.
0000    23 ;
0000    24 ; 23    Bill Landry     22-OCT-81
0000    25 ;       Added PSL_RDM macro
0000    26 ;
0000    27 ; 22    Dave Spain       5 Oct 81
0000    28 ;       Added RDM_FPA and FPA_M[] FPA_RDM macros.
0000    29 ;
0000    30 ; 21    Bill Landry     29 Sept 81
0000    31 ;       Added FPA macro, FPA_M[] FPA_R[].
0000    32 ;
0000    33 ; 20    Dave Spain      14 Aug 81
0000    34 ;       Added the TESTFPA [] macro.
0000    35 ;
0000    36 ; 19    Dave Spain      18 July 81
0000    37 ;       Added the following FPA macros, FPA_RDM and FPA_R[].
0000    38 ;
0000    39 ; 18    Dave Spain      24 Sept 80
0000    40 ;       Added RDM_Q macro. This macro uses the ALU.
0000    41 ;
0000    42 ; 17    Bill Landry     23 Sept 80
0000    43 ;       Added macro VA_VA-ZLIT0[] for testing memory in decending order.
0000    44 ;
0000    45 ; 16    Dave Spain      27 August 80
0000    46 ;       Changed RDM_Q macro to RDM_Q Q_D. This more accurately reflects macro.
0000    47 ;
0000    48 ; 15    Bill Landry     4 June 80
0000    49 ;       Deleted BUS/PRB.RD.PTE from macro CLRTB.VA_VA and CLRCH.VA_VA to
0000    50 ;       satisfy validity checks.
0000    51 ;
0000    52 ; 14    Dave Spain      23 May 80
0000    53 ;       Added BUS/PRB.RD.PTE to the clear cache and clear TB macros for Mr.
0000    54 ;       Bill.
0000    55 ;
0000    56 ; 13    Dave Spain      14 Apr 80
0000    57 ;       Added SIZE[] or VSIZE/1 to some macros. This allows version 65 of
```

```
0000     58 ;       the COMET micro-code defines to run.
0000     59 ;
0000     60 ; 12    Bill Landry       1 Apr 80
0000     61 ;       Added BUS/PRB.RD micro order to RDM_TB macro to compensate for timing
0000     62 ;       problem in ADD gate array.  This is not an APRIL FOOL!
0000     63 ;
0000     64 ; 11    Dave Spain       27 Mar 80
0000     65 ;       Fixed TB macro's to include MSRC/VA to prevent validity failure.
0000     66 ;
0000     67 ; 10    Bill Landry      19 Mar 80
0000     68 ;       Added Q_R[].RL.P and VA_Q.OR.R[]
0000     69 ;
0000     70 ; 09    Bill Landry      19 Mar 80
0000     71 ;       Deleted TB_R[].RL.P.OR.D
0000     72 ;
0000     73 ; 08    Bill Landry      18 Mar 80
0000     74 ;       Added VA_R[].RL.P
0000     75 ;
0000     76 ; 07    Bill Landry      07 Mar 80
0000     77 ;       Added Q_M[].RL.PTE
0000     78 ;
0000     79 ; 06    Dave Spain       06 Mar 80
0000     80 ;       Changed TB_R[].RL.P macro to TB_R[].RL.P.OR.D.
0000     81 ;
0000     82 ; 05    Dave Spain       03 Mar 80
0000     83 ;       Added TB_R[].RL.P macro for Bill Landry.
0000     84 ;
0000     85 ; 04    Dave Spain       22 Feb 80
0000     86 ;       Added CLRTB.VA_R[] macro for Bill Landry.
0000     87 ;
0000     88 ; 03    Dave Spain       30 Jan 80
0000     89 ;       Added Tom Groetzinger's macro definitions.
0000     90 ;
0000     91 ; 02    Dave Spain       30 Jan 80
0000     92 ;       Added Tony Vezza's macro definitions.
0000     93 ;
0000     94 ; 01    Dave Spain       29 Jan 80
0000     95 ;       Macros initiated.

0037        3 ;*******************************************************************************
0037        4 ;++
0037        5 ;
0037        6 ; FUNTIONAL DESCRIPTION:
0037        7 ;
0037        8 ;       This test will check for the presence of the PCS module (L0008) and
0037        9 ;       if present then initialize all of the patch bits to 1 (non-asserted).
0037       10 ;
0037       11 ; TEST ALGORITHM:
0037       12 ;
0037       13 ;         1.  Initialize the CPU
0037       14 ;         2.  Execute the microcode to:
0037       15 ;                a.  Disable Cache
0037       16 ;                b.  Enable the CMI
0037       17 ;         3.  Set error loop address
0037       18 ;         4.  Let RDM know that we expect a micro trap
0037       19 ;         5.  Execute the microcode to:
0037       20 ;                a.  Load VA with PCS Base address
0037       21 ;                b.  Write a test pattern to VA
0037       22 ;                c.  Give time for write to complete
0037       23 ;                d.  Read the location by the VA
0037       24 ;                e.  Pass read data back to RDM
0037       25 ;         6.  Check for micro trap.  If there is a micro trap, PCS (L0008) is
0037       26 ;             not installed on the system, then do the following:
0037       27 ;                a.  Execute the microcode to:
0037       28 ;                       i.  Point to Bus Error Register
0037       29 ;                      ii.  Pass the Bus Error Register back to the RDM
0037       30 ;                b.  Check to see if NXM bit is set.
0037       31 ;                c.  If NXM bit was not set then call an error, got a bit set
0037       32 ;                    that shouldn't have been.
0037       33 ;                d.  Skip to next test
0037       34 ;          7.  Check to see that read data matches the write pattern.
0037       35 ;          8.  Call an error if read data and write pattern did not match.
0037       36 ;          9.  Set error loop address
0037       37 ;         10.  Set-up DCS at starting micro address
0037       38 ;         11.  Insure that the Clocks are turned off
0037       39 ;         12.  Load match register with 1801(hex)
0037       40 ;         13.  Clear master halt enable
0037       41 ;         14.  Set bit to watch for micro traps
0037       42 ;         15.  Start the CPU clocks
0037       43 ;         16.  Perform a Watchdog loop while executing the microcode to:
0037       44 ;              (if loop count expires then force an error, shouldn't happen)
0037       45 ;                 a.  Load VA with address of Enable Register
0037       46 ;                 b.  Enable the writing of the patch bits
0037       47 ;                 c.  Give time for the write to complete
0037       48 ;                 d.  Load the VA with the patch bit starting address
0037       49 ;                 e.  Jump to DCS address 0
0037       50 ;                 f.  Pass the current VA to the RDM
0037       51 ;                 g.  Write the patch bit to a 1 (disable the patch bit)
0037       52 ;                 h.  Give time for the write to complete
0037       53 ;                 i.  Update the VA by 4
0037       54 ;                 j.  Check to see if VA is pointing to patch bit last address
0037       55 ;                     + 4.
0037       56 ;                        i.  If VA is equal to F08000 then next address will
```

```
0037     57 ;                              be equal to 1801 and a micro match will take
0037     58 ;                              place, ELSE
0037     59 ;                          ii. If VA is not equal to F08000 then next address
0037     60 ;                              will be equal to 1800 and microcode execute
0037     61 ;                              procedes as normal.
0037     62 ;                  k. Jump to DCS address 0, (go to step 16-f)
0037     63 ;          17. Check WHREG to insure that the last patch bit address was reached.
0037     64 ;          18. If WHREG not equal to last patch bit address then call an error.
0037     65 ;          19. Execute the microcode to:
0037     66 ;                  a. Load VA with PCS/WCS or Patch bit write enable register
0037     67 ;                  b. Initialize the register with zero
0037     68 ;                  c. Return back to the RDM
0037     69 ;          20. Skip to next test
0037     70 ;
0037     71 ; TEST PATTERNS:
0037     72 ;
0037     73 ;          The following test pattern is used when writing PCS to see if it is
0037     74 ;          present:
0037     75 ;
0037     76 ;                  000AAAAA
0037     77 ;
0037     78 ; LOGIC DESCRIPTION:
0037     79 ;
0037     80 ;          With the PCS module installed this test will check the CMI to PCS
0037     81 ;          interface logic to insure that, 1)  it will respond to its physical
0037     82 ;          address, and, 2) the data line tranceivers are working by writing
0037     83 ;          then reading a test pattern.
0037     84 ;
0037     85 ; ASSUMPTIONS:

0020    739 ;*****************************************************************************
0020    740 ;++
0020    741 ;
0020    742 ; FUNCTIONAL DESCRIPTION
0020    743 ;
0020    744 ;       This test isolates single bits stuck high or stuck low and can detect
0020    745 ;       two bits stuck high or low or tied to each other on the CS bus.
0020    746 ;
0020    747 ; TEST ALGORITHM
0020    748 ;
0020    749 ;       This test is implemented in five subtests. Subtests 1-4 isolate single
0020    750 ;       bit errors, while subtest 5 will detect double bit errors.
0020    751 ;
0020    752 ;       Subtest 1
0020    753 ;
0020    754 ;       This subtest checks for one bit in the odd parity field stuck at one.
0020    755 ;
0020    756 ;        1. Place zeros onto CPU control store lines.
0020    757 ;        2. Examine the front panel register for a parity error.
0020    758 ;        3. If there is a parity error, skip to subtest 2.
0020    759 ;        4. Prepare a loop of 40 iterations. (One iteration per bit)
0020    760 ;        5. Set a bit in the odd parity field, indexed by the loop count.
0020    761 ;        6. Is there a parity error?
0020    762 ;        7. If not, print out the loop count to identify the bad bit.
0020    763 ;        8. Otherwise, continue looping.
0020    764 ;
0020    765 ;       Subtest 2
0020    766 ;
0020    767 ;       This subtest checks for one bit in the odd parity field stuck at zero.
0020    768 ;
0020    769 ;        1. Places ones onto the CPU control store lines.
0020    770 ;        2. Examine the front panel register for a parity error.
0020    771 ;        3. If there is a parity error, skip to subtest 3.
0020    772 ;        4. Prepare a loop of 40 iterations.
0020    773 ;        5. Clear a bit in the odd parity field, indexed by the loop count.
0020    774 ;        6. Is there a parity error?
0020    775 ;        7. If not, print out the loop count to identify the bad bit.
0020    776 ;        8. Otherwise, continue looping.
0020    777 ;
0020    778 ;       Subtest 3
0020    779 ;
0020    780 ;       This subtest checks for one bit in the even parity field stuck at one.
0020    781 ;
0020    782 ;        1. Drive a single one in the odd parity field and all zeroes in the
0020    783 ;           even parity field from DCS into the CPU.
0020    784 ;        2. Examine the front panel register in the RDM for a parity error.
0020    785 ;        3. If there is no parity error, skip to subtest 4.
0020    786 ;        4. Prepare a loop of 40 iterations.
0020    787 ;        5. Leaving a one in the odd parity field, float a one through the
0020    788 ;           even parity field, indexed by the loop count.
0020    789 ;        6. Is there a parity error?
0020    790 ;        7. If yes, the print out the loop count to identify the bad bit.
0020    791 ;        8. Otherwise, continue looping.
0020    792 ;
```

```
                                0020    793 ;       Subtest 4
                                0020    794 ;
                                0020    795 ;       This subtest checks for one bit stuck at zero in the even parity field.
                                0020    796 ;
                                0020    797 ;       1. Drive a single one in the odd parity field and all ones in the even
                                0020    798 ;          parity field from DCS into the CPU.
                                0020    799 ;       2. Examine the front panel register in the RDM for a parity error.
                                0020    800 ;       3. If there is no parity error, skip to subtest 5.
                                0020    801 ;       4. Prepare a loop of 40 iterations.
                                0020    802 ;       5. Leaving a one in the odd parity field, float a one through the even
                                0020    803 ;          parity field, indexed by the loop count.
                                0020    804 ;       6. Is there a parity error?
                                0020    805 ;       7. If yes, the print out the loop count to identify the bad bit.
                                0020    806 ;       8. Otherwise, continue looping.

ASSUMPTIONS

        This test makes no assumptions about the CPU. However, it does
        assume that the RDM is functional.

ERROR DESCRIPTION

        Below is a table of possible error conditions and their most likely
        causes. Whenever there is a failure in Subtests 1-4 there should also
        be a failure in Subtest 5.
```

Error	Probable Cause
There is one error in any single subtest.	There is a bit stuck at zero or one in the parity field under test.
There is one error in each of Subtests 2 and 4.	There is a double bit error across the odd and even parity fields. Use the loop counts from each subtest to identify the bad bits.
Only Subtest 5 fails.	There is a double bit error in one parity field.

```

;*****************************************************************************

        SUBTEST         1

;/////////////////////////////////////////////////////////////////////////////
;+
; BIT IN ODD PARITY FIELD STUCK AT ONE
;
; This subtest loads the odd and even parity fields with zeros. It then checks
; for a parity error. If it gets one it continues to subtest 2, otherwise it
; assumes there is a bit stuck at one in the odd parity field.
;
; When this subtest fails it tries to isolate the bad bit in the odd parity
; field by floating a one through a field of zeros. When the parity error goes
; away it assumes it has found the bad bit. You can tell the bad bit by
; indexing into the following table:
;
;       Loop  CS Bit #   CS Mnemonic    Loop  CS Bit #   CS Mnemonic
;
;        01      00      NEXT 00         15      20      BUS 00

0019  1814 ;*******************************************************************************
0019  1815 ;++
0019  1816 ;
0019  1817 ; FUNCTIONAL DESCRIPTION
0019  1818 ;
0019  1819 ;       This test checks the D Register for data integrity by selecting and
0019  1820 ;       loading one of three patterns into the LONLIT Register,from the
0019  1821 ;       LONLIT register into the D Register,loading the Q Register from the
0019  1822 ;       D Register and reading data into the RDM from the Q Register.
0019  1823 ;
0019  1824 ; TEST ALGORITHM
0019  1825 ;
0019  1826 ;       1. Load the micro words to perform the test.
0019  1827 ;       2. Setup loop of three iterations.
0019  1828 ;       3. Select and load data pattern.
0019  1829 ;       4. Execute the micro sequence.
0019  1830 ;               1. Load LONLIT register with selected pattern.
0019  1831 ;               2. Load D REGISTER from LONLIT register.
0019  1832 ;               3. Load Q register from D REGISTER.
0019  1833 ;               4. Read Q register into RDM.
0019  1834 ;       5. Check the results.
0019  1835 ;       6. Looped three times?If not go to step three.
0019  1836 ;
0019  1837 ; DATA PATTERNS
0019  1838 ;
0019  1839 ;       The following pattern are used to test the "D" Register:
0019  1840 ;
0019  1841 ;               AAAAAAAA
0019  1842 ;               55555555

0019  1847 ;         ALPCTL/WX_D_R.Q_D
0019  1848 ;
0019  1849 ; LOGIC DESCRIPTION
0019  1850 ;
0019  1851 ;       This test checks the D REGISTER (which is internal to the ALP
0019  1852 ;       Gate Array) and attendent ALP Gate Array's Mux's for open or
0019  1853 ;       shorted data paths and proper ALK Gate Array and ALP Gate
0019  1854 ;       Array data path decode.
0019  1855 ;
0019  1856 ; ASSUMPTIONS
0019  1857 ;
0019  1858 ;       This test requires no signals from the other CPU modules but
0019  1859 ;       assumes an operational RBUS and WBUS.
0019  1860 ;
0019  1861 ; ERROR DESCRIPTION

0026  2385 ;*******************************************************************************
0026  2386 ;++
0026  2387 ;
0026  2388 ; FUNCTIONAL DESCRIPTION
0026  2389 ;
0026  2390 ;       This test consists of three subtests,one for each group of R
0026  2391 ;       Scratchpads,that writes each location with three patterns and
0026  2392 ;       reads it back into the RDM for checking.
0026  2393 ;
0026  2394 ; TEST ALGORITHM
0026  2395 ;
0026  2396 ;       1. Load the micro words to perform the test.
0026  2397 ;       2. Setup a loop of 16 iterations.
0026  2398 ;       3. Select and load a data address.
0026  2399 ;       4. Setup a loop of 3 iterations.
0026  2400 ;       5. Select and load a data pattern.
0026  2401 ;       6. Load the micro word with the pattern.
0026  2402 ;       7. Execute the micro sequence.
0026  2403 ;               1. Load pattern into LONLIT Register.
0026  2404 ;               2. Transfer pattern to Q Register.
0026  2405 ;               3. Transfer pattern to selected scratchpad.
0026  2406 ;               4. Read pattern into RDM.
0026  2407 ;       8. Check the results.
0026  2408 ;       9. Looped 3 times? if not go to step five.
0026  2409 ;       10.Looped 16 times? if not go to step three.

                2596 ;
                2597 ; FUNCTIONAL DESCRIPTION
                2598 ;
                2599 ;       This test consists of three subtests which check that the R Scratchpad
                2600 ;       address lines are not open nor shorted together.Each subtest initial-
                2601 ;       izes the two most significant bits of the RSRC field to one of three
                2602 ;       values:0,1 or 2 (0=RTEMP,1=GPR,2=IPR).Other than this initialization
                2603 ;       the tests are identical.
                2604 ;
                2605 ; TEST ALGORITHM
                2606 ;
                2607 ;       1. Load the micro words to perform the test.
                2608 ;       2. Setup loop of 20 iterations.
                2609 ;       3. Load RSRC Field Least Significant Byte from Table 1 into micro word
                2610 ;               This corresponds to the first register.
                2611 ;       4. Load RSRC Field Least Significant Byte from Table 2 into micro word
                2612 ;               This corresponds to the second register.
                2613 ;       5. Execute the micro sequence.
                2614 ;               1. Load LONLIT register with -1.
                2615 ;               2. Transfer data to Q register.
                2616 ;               3. Transfer data to first R scratchpad.
                2617 ;               4. Load LONLIT register with zero.
                2618 ;               5. Transfer data to Q register.
                2619 ;               6. Transfer data to second R scratchpad.
                2620 ;               7. Read first R scratchpad into RDM.
                2621 ;       6. Check the results.

0029  2895 ; LOGIC DESCRIPTION
0029  2896 ;
0029  2897 ;       This test checks the DSIZE and ISIZE Decoding logic located on the DPM
0029  2898 ;       that is not involved with IRD.
0029  2899 ;
0029  2900 ; ASSUMPTIONS
0029  2901 ;
0029  2902 ;       Subtest 1 assumes that the MSRC XB H signal from the MIC module is not
0029  2903 ;       asserted. Otherwise these tests require no signals from any other CPU
0029  2904 ;       modules but assume an operational VBUS.
0029  2905 ;
0029  2906 ; ERROR DESCRIPTION

0025  3223 ;*****************************************************************************
0025  3224 ;++
0025  3225 ;
0025  3226 ; FUNCTIONAL DESCRIPTION
0025  3227 ;
0025  3228 ;       This test checks the data integrity of the MTEMP registers by
0025  3229 ;       loading and reading six patterns.
0025  3230 ;
0025  3231 ; TEST ALGORITHM
0025  3232 ;
0025  3233 ;       1. Load micro words to perform the test.
0025  3234 ;       2. Setup a loop of six iterations.
0025  3235 ;       3. Select and load data pattern into LONLIT field of micro word.
0025  3236 ;       4. Execute the micro sequence.
0025  3237 ;               1. Load LONLIT Register with pattern.
0025  3238 ;               2. Load pattern into M[0] from LONLIT Register.
0025  3239 ;               3. Read pattern from M[0] into Q Register.
0025  3240 ;               4. Read pattern into RDM from Q register.
0025  3241 ;       5. Check the results.
0025  3242 ;       6. Looped six times? If not,go to step three.
0025  3243 ;
0025  3244 ; DATA PATTERNS
0025  3245 ;
0025  3246 ;       One of the following patterns is used each time through the loop:
0025  3247 ;
0025  3248 ;               AAAAAAAA

0017  4179 ; LOGIC DESCRIPTION
0017  4180 ;
0017  4181 ;        This test checks the ALU and alu function decode logic contained
0017  4182 ;        entirely within the 8 ALP Gate Arrays and the ALK Gate Array.
0017  4183 ;
```

0038        .SBTTL  "TEST   01F     Register Back Up Stack(RBS) and Pointer(RBSP) Tests
0038  4761 ;*******************************************************************************
0038  4762 ;++
0038  4763 ;
0038  4764 ; FUNCTIONAL DESCRIPTION
0038  4765 ;
0038  4766 ;       This test consists of nine subtests which check the Register Backup
0038  4767 ;       Stack(RBS) and the Register Backup Stack Pointer(RBSP) for operation
0038  4768 ;       and data integrity.
0038  4769 ;       The first subtest checks that the RBSP can be cleared.
0038  4770 ;       The second subtest checks that the RBSP can be incremented.
0038  4771 ;       The third test checks that the RBSP,which is a three bit counter,can
0038  4772 ;       be cleared from a count of six and the fourth subtest checks that the
0038  4773 ;       RBSP can be cleared from a count of one thus making sure that all bits
0038  4774 ;       of the counter can be reset.
0038  4775 ;       The fifth subtest checks the data integrity of the DTYPE portion of
0038  4776 ;       the RBS.
0038  4777 ;       The sixth subtest checks the RSRC portion of the RBS for data
0038  4778 ;       integrity.
0038  4779 ;       The seventh subtest checks the Decrement/Increment bit for data
0038  4780 ;       integrity.
0038  4781 ;       The eithth subtest checks the RBS for dual addressing faults.
0038  4782 ;       The nineth subtest checks that the RBSP is not cleared by RSRC
0038  4783 ;       fields other than ZERO.CLRRBSP with LIT Field equal to Zero.
0038  4784 ;       The values used for SUBTEST 9 were determined by the
0038  4785 ;       XLOG simulator and may be found in the Data Tables.
0038  4786 ;
0038  4787 ; TEST ALGORITHM
0038  4788 ;
0038  4789 ;       SUBTEST 1
0038  4790 ;
0038  4791 ;        1. Load the micro words to perform the test.
0038  4792 ;        2. Execute the micro sequence.
0038  4793 ;               1. Clear Register-Backup-Stack Pointer.
0038  4794 ;               2. Read Register-Backup-Stack Pointer into RDM.
0038  4795 ;        3. Check that Register-Backup-Stack Pointer is zero.
0038  4796 ;
0038  4797 ;       SUBTEST 2
0038  4798 ;
0038  4799 ;        1. Load the micro words to perform the test.
0038  4800 ;        2. Execute the micro sequence.
0038  4801 ;               1. Clear the Register-Backup-Stack Pointer.
0038  4802 ;        3. Setup a loop of eight iterations.
0038  4803 ;        4. Execute the micro sequence.
0038  4804 ;               1. Increment Register-Backup-Stack Pointer.
0038  4805 ;               2. Read Register-Backup-Stack Pointer into RDM.
0038  4806 ;        5. Check that Register-Backup-Stack Pointer incremented.
0038  4807 ;        6. Looped eight times?if not,go to step four.
0038  4808 ;
0038  4809 ;       SUBTEST 3
0038  4810 ;
0038  4811 ;        1. Load the micro words to perform the test.
0038  4812 ;        2. Execute the micro sequence.
0038  4813 ;               1. Clear the Register-Backup-Stack Pointer.
0038  4814 ;        3. Execute the micro sequence.
```

```
0038  4815 ;                1. Increment Register Back-up Stack Pointer six times.
0038  4816 ;                2. Clear Register Back-up Stack Pointer.
0038  4817 ;                3. Read Register Back-up Stack Pointer into RDM.
0038  4818 ;         4. Check that Register-Backup-Stack Pointer was cleared.
0038  4819 ;
0038  4820 ;        SUBTEST 4
0038  4821 ;
0038  4822 ;         1. Load the micro words to perform the test.
0038  4823 ;         2. Execute the micro sequence.
0038  4824 ;                1. Clear the Register-Backup-Stack Pointer.
0038  4825 ;         3. Execute the micro sequence.
0038  4826 ;                1. Increment Register-Backup-Stack Pointer one time.
0038  4827 ;                2. Clear Register-Backup-Stack Pointer.
0038  4828 ;                3. Read Register-Backup-Stack Pointer into RDM.
0038  4829 ;         4. Check that Register-Backup-Stack Pointer was cleared.
0038  4830 ;
0038  4831 ;        SUBTEST 5
0038  4832 ;
0038  4833 ;         1. Load the micro words to perform the test.
0038  4834 ;         2. Load a pattern from Table 6 into RSRC field of the micro word.
0038  4835 ;         3. Load a pattern from Table 8 into MSRC field of the micro word.
0038  4836 ;         4. Setup loop of three iterations.
0038  4837 ;         5. Select and load a pattern from Table 7 into DTYPE field of the
0038  4838 ;                micro word.
0038  4839 ;         6. Execute micro sequence.
0038  4840 ;                1. Clear Register-Backup-Stack Pointer.
0038  4841 ;                2. Write R Scratchpad.
0038  4842 ;                3. Clear Register-Backup-Stack Pointer.
0038  4843 ;                4. Read RBS into RDM.
0038  4844 ;         7. Check the results of the DTYPE read.
0038  4845 ;         8. Looped three times?If not go to step five.
0038  4846 ;
0038  4847 ;        SUBTEST 6
0038  4848 ;
0038  4849 ;         1. Load the micro words to perform the test.
0038  4850 ;         2. Load a pattern from Table 7 into DTYPE field of the micro word.
0038  4851 ;         3. Setup loop of four iterations.
0038  4852 ;         4. Select and load a pattern from Table 6 into RSRC field of the
0038  4853 ;                micro word.
0038  4854 ;         5. Select and load a pattern from Table 8 into MSRC field of the
0038  4855 ;                micro word.
0038  4856 ;         6. Execute micro sequence.
0038  4857 ;                1. Clear Register-Backup-Stack Pointer.
0038  4858 ;                2. Write R Scratchpad.
0038  4859 ;                3. Clear Register-Backup-Stack Pointer.
0038  4860 ;                4. Read RBS.
0038  4861 ;                5. Read RNUM into RDM.
0038  4862 ;         7. Check the results of the RNUM read.
0038  4863 ;         8. Looped four times?If not go to step four.
0038  4864 ;
0038  4865 ;        SUBTEST 7
0038  4866 ;
0038  4867 ;        1.  Load the micro words to perform the test.
0038  4868 ;        2.  Setup loop of two iterations.  When Loop I is equal to 1, perform
0038  4869 ;            an PUSH RBS+.  When Loop I is equal to 2, perform a PUSH RBS-.
```

```
0038  4870 ;       3.  Perform the following micro code to clear the Register Backup
0038  4871 ;           Stack Pointer:
0038  4872 ;               a.  Nop to get the CPU up to speed.
0038  4873 ;               b.  Do a RSRC/ZERO.CLRRBSP,LIT/0
0038  4874 ;               c.  Halt
0038  4875 ;       4.  Setup loop of six iterations to do the RBS PUSH.
0038  4876 ;       5.  Perform the following microcode to PUSH on the RBS:
0038  4877 ;               a.  Nop to get the CPU up to speed.
0038  4878 ;               b.  On loop I = 1 perform : VSIZE/1,PUSH RBS+
0038  4879 ;                   On loop I = 2 perfrom : VSIZE/1,PUSH RBS-
0038  4880 ;               c.  Halt
0038  4881 ;       6.  Continue PUSHing the RBS until loop J = 6
0038  4882 ;       7.  Execute the micro code from step 3 to clear the RBSP.
0038  4883 ;       8.  Setup loop of Six interations to do the POP RBS.
0038  4884 ;       9.  Execute the following micro code:
0038  4885 ;               a.  Nop to get the CPU up to speed.
0038  4886 ;               b.  Perform - RNUM_POPRBS MTEMP0_POPSIZ,RBS + OR - ?,NEXT/1800
0038  4887 ;               c.  Halt
0038  4888 ;       10. Compare the contents of the CSTRP register for correct results.
0038  4889 ;       11. If results don't compare, signal an error.
0038  4890 ;       12. Load micro word to perform a PUSH RBS- (VSIZE/1,PUSH RBS-).
0038  4891 ;       13. Continue with loop I until I = 2 (goto step 2 if I not equal to 2).
0038  4892 ;
0038  4893 ;       SUBTEST 8
0038  4894 ;
0038  4895 ;        1. Load the micro words to perform the test.
0038  4896 ;        2. Setup loop of eight iterations.
0038  4897 ;        3. Select and load data pattern from table 1 into RSRC field of
0038  4898 ;               micro word.
0038  4899 ;        4. Select and load data pattern from table 2 into DTYPE field
0038  4900 ;               of micro word.
0038  4901 ;        5. Select and load data pattern from table 3 into MSRC field of
0038  4902 ;               micro word.
0038  4903 ;        6. Execute micro sequence.
0038  4904 ;                    1. Clear RBS Pointer.
0038  4905 ;                    2. Write all zeroes in location zero.
0038  4906 ;                    3. Write all ones in location one.
0038  4907 ;                    4. Write all zeroes in location two.
0038  4908 ;                    5. Write all ones in location three.
0038  4909 ;                    6. Write all zeroes in location four.
0038  4910 ;                    7. Write all ones in location five.
0038  4911 ;                    8. Write all zeroes in location six.
0038  4912 ;                    9. Write all zeroes in location seven.
0038  4913 ;        7. Looped eight times?If not,go to step 3.
0038  4914 ;        8. Execute the micro sequence.
0038  4915 ;                    1. Clear the Register-Backup-Stack Pointer.
0038  4916 ;        9. Setup another loop of eight iterations.
0038  4917 ;       10. Execute micro sequence.
0038  4918 ;                    1. Read RBS into RDM.
0038  4919 ;       11. Check results.
0038  4920 ;       12.Looped eight times?If not,go to step ten.
0038  4921 ;
0038  4922 ;       SUBTEST 9
0038  4923 ;
0038  4924 ;        1. Load the micro words to perform the test.
```

```
0038  4925 ;       2. Setup a loop of seven iterations.
0038  4926 ;       3. Select values from Tables 4 and 5 and load them into RSRC field
0038  4927 ;            and LIT Field of micro word,respectively.
0038  4928 ;       4. Execute micro sequence.
0038  4929 ;            1. Init RBS Pointer to 1.
0038  4930 ;            2. Read RBS Pointer into RDM,with RSRC field and LIT Field
0038  4931 ;                 set to selected values.
0038  4932 ;       5. Check results.
0038  4933 ;       6. Looped seven times?If not,go to step three.

0038  4959 ; LOGIC DESCRIPTION
0038  4960 ;
0038  4961 ;       These tests check the Register Backup Stack,Register Backup
0038  4962 ;       Stack Pointer and associated circuitry,all within the SPA
0038  4963 ;       Gate Array,for proper operation.
0038  4964 ;
0038  4965 ; ASSUMPTIONS
0038  4966 ;
0038  4967 ;       This test requires no signals from any other CPU modules but
0038  4968 ;       assumes an operational WBUS and RBUS.
0038  4969 ;
0038  4970 ; ERROR DESCRIPTION

0023  5530 ;*******************************************************************************
0023  5531 ;++
0023  5532 ;
0023  5533 ; FUNCTIONAL DESCRIPTION
0023  5534 ;
0023  5535 ;       This test checks that M[TEMP0] is written by default with various MSRC
0023  5536 ;       fields in the microword.
0023  5537 ;
0023  5538 ; TEST ALGORITHM
0023  5539 ;
0023  5540 ;       This test is divided into two subtests. The first subtest examines the
0023  5541 ;       default write with MSRC micro-orders that do not drive the WBUS. The
0023  5542 ;       second subtest examines the same write with MSRC micro-orders that do
0023  5543 ;       drive the WBUS.
0023  5544 ;
0023  5545 ;       The test algorithm proceeds as follows:
0023  5546 ;
0023  5547 ;       Subtest 1
0023  5548 ;
0023  5549 ;        1. Initialize the CPU.
0023  5550 ;        2. Open the window to the signature analyzer.
0023  5551 ;        3. Prepare a loop of ten iterations.
0023  5552 ;        4. Load the MSRC field of the first test micro-instruction.
0023  5553 ;        5. Load that micro-word into DCS.
0023  5554 ;        6. Execute the micro sequence:
0023  5555 ;                1. Initialize M[TEMP0] with a -1.
0023  5556 ;                2. Execute the default write.
0023  5557 ;                3. Read M[TEMP0] back to the RDM.
0023  5558 ;        7. Check the results.
0023  5559 ;        8. Looped ten times? If not go to STEP 4.
0023  5560 ;
0023  5561 ;       Subtest 2
0023  5562 ;
0023  5563 ;        9. Prepare a loop of three iterations.
0023  5564 ;       10. Load the MSRC field of the second test micro-instruction.
0023  5565 ;       11. Load that micro-word into DCS.
0023  5566 ;       12. Execute the micro sequence:
0023  5567 ;                1. Initialize M[TEMP0] with a -1.
0023  5568 ;                2. Execute the default write.
0023  5569 ;                3. Read M[TEMP0] back to the RDM.
0023  5570 ;       13. Check the results.
0023  5571 ;       14. Looped three times? If not go to STEP 4.
0023  5572 ;
0023  5573 ; DATA PATTERNS
0023  5574 ;
0023  5575 ;       The following patterns are used each time thru the loop:
0023  5576 ;
0023  5577 ;                FFFFFFFF
0023  5578 ;                00000000
0023  5579 ;
0023  5580 ;       The following are used in the MSRC Field of the micro word:
0023  5581 ;
0023  5582 ;       Subtest 1
0023  5583 ;

001B  5902 ;*******************************************************************************
001B  5903 ;++
001B  5904 ;
001B  5905 ; FUNCTIONAL DESCRIPTION
001B  5906 ;
001B  5907 ;       This test checks that the SPA Gate Array selects only R[10]
001B  5908 ;       when writing the R Scratchpad indexed by RNUM.
001B  5909 ;
001B  5910 ; TEST ALGORITHM
001B  5911 ;
001B  5912 ;       1. Load the micro words to perform the test.
001B  5913 ;       2. Load DCS.
001B  5914 ;       3. Execute the micro sequence.
001B  5915 ;                   1. Load R[20] with 11111111.
001B  5916 ;                   2. Load R[0] with 22222222.
001B  5917 ;                   3. Load M[3] with 44444444.
001B  5918 ;                   4. Load RNUM with 0.
001B  5919 ;                   5. Load R[10] with 88888888 with RSRC field set to
001B  5920 ;                        GPR indexed by RNUM and MSRC Field set to zero.
001B  5921 ;                   6. 'OR' contents of M[3] with contents of R[10] and
001B  5922 ;                        put results back in M[3].
001B  5923 ;                   7. Load Q Register from R[0].
001B  5924 ;                   8. 'OR' contents of R[20] with contents of Q Register
001B  5925 ;                      and put results back in R[20].
001B  5926 ;                   9. 'OR' M[3] with R[20] and read results into RDM
001B  5927 ;       3. Check the results.
001B  5928 ;
001B  5929 ; DATA PATTERNS
001B  5930 ;
001B  5931 ;       The following patterns are used:
001B  5932 ;
001B  5933 ;                   00000000
001B  5934 ;                   11111111

001B  5938 ;
001B  5939 ; LOGIC DESCRIPTION
001B  5940 ;
001B  5941 ;       This test checks that the SPA Gate Array chip select circuitry will
001B  5942 ;       select only R[10] when the R Scratchpad is indexed by RNUM with RNUM
001B  5943 ;       equal to zero.
001B  5944 ;
001B  5945 ; SIMULATION
001B  5946 ;
001B  5947 ;       This test was developed using output from the Fault Detection
001B  5948 ;       Simulator XLOG with the following parameters:
001B  5949 ;
001B  5950 ;                   PHASE=WRITE
001B  5951 ;                   SPW=NOT MLONG
001B  5952 ;                   RNUM=0
001B  5953 ;                   MSRC=0
001B  5954 ;                   RSRC=GPR.R
001B  5955 ;
```

```
                        001B  5956 ;       Expected chip selects:
                        001B  5957 ;
                        001B  5958 ;               GPR
                        001B  5959 ;
                        001B  5960 ;       Expected M Address from SPA Gate Array:
                        001B  5961 ;
                        001B  5962 ;               3
                        001B  5963 ;
                        001B  5964 ;       Expected R Address from SPA Gate Array:
                        001B  5965 ;
                        001B  5966 ;               0
                        001B  5967 ;
                        001B  5968 ; ASSUMPTIONS
                        001B  5969 ;
                        001B  5970 ;       This test requires no signals from any other CPU modules.
                        001B  5971 ;       It assumes thet previous tests hve been run to verify that
                        001B  5972 ;       the logic and registers used by this test are operational.

001B  6721 ;*******************************************************************************
001B  6722 ;++
001B  6723 ;
001B  6724 ; FUNCTIONAL DESCRIPTION
001B  6725 ;
001B  6726 ;       This test checks the SPA Gate Array for proper operation of the chip
001B  6727 ;       selects when indexing by the RNUM Register during a Read M Scratchpad
001B  6728 ;       operation.
001B  6729 ;
001B  6730 ; TEST ALGORITHM
001B  6731 ;
001B  6732 ;       1. Load the micro words to perform the test.
001B  6733 ;       2. Setup a loop of 4 iterations.
001B  6734 ;       3. Select and load the fields into the micro word.
001B  6735 ;       4. Load DCS and execute the micro sequence.
001B  6736 ;               1. Load R[10] Register with 11111111 pattern.
001B  6737 ;               2. Load R[20] Register with 22222222 pattern.
001B  6738 ;               3. Load R[0] with 88888888.
001B  6739 ;               4. Load M Register selected from first table with
001B  6740 ;                  88888888 pattern.
001B  6741 ;               5. Load RNUM Register with value selected from second table.
001B  6742 ;               6. 'AND' M Scratchpad referenced by MSRC field value selected
001B  6743 ;                  from third table with R[0] and  put results in Q
001B  6744 ;                  Register.
001B  6745 ;               7. 'OR' Q Register with R Scratchpad selected from second
001B  6746 ;                  table and put results back in Q Register.
001B  6747 ;               8. 'OR' Q Register with R Scratchpad selected from first
001B  6748 ;                  table and put results in RDM.
001B  6749 ;       5. Check the results.
001B  6750 ;       6. Looped 4 times? If not go to STEP 3.

0039   7575 ;*****************************************************************************
0039   7576 ;++
0039   7577 ;
0039   7578 ; FUNCTIONAL DESCRIPTION:
0039   7579 ;
0039   7580 ;       This test will consist of 3 subtests to check the operation of
0039   7581 ;       the WCTRL Micro-orders that affect the Processor Status Longword
0039   7582 ;       Register.  Micro-orders tested are:
0039   7583 ;                1.  IPL_WB
0039   7584 ;                2.  PREV_WB
0039   7585 ;                3.  PREV_CUR.ISCUR_WB
0039   7586 ;
0039   7587 ;
0039   7588 ; TEST ALGORITHM:
0039   7589 ;
0039   7590 ;       1.  MODIFY DCS FOR THIS SUBTEST
0039   7591 ;       2.  LOAD DATA PATTERN FOR PSL INTO WD REGISTER (RDM)
0039   7592 ;       3.  EXECUTE DCS PROGRAM
0039   7593 ;               1.  WRITE DATA PATTERN IN WD REGISTER TO PSL REGISTER
0039   7594 ;               2.  PERFORM MICRO-ORDER BEING TESTED
0039   7595 ;               3.  READ PSL BACK TO RDM
0039   7596 ;       4.  COMPARE RESULTS (EXPECTED AND RECEIVED)
0039   7597 ;       5.  IF NO ERROR GO TO NEXT SUBTEST
0039   7598 ;
0039   7599 ;
0039   7600 ; TEST PATTERNS:
0039   7601 ;
0039   7602 ;       SUBTEST         MICRO_ORDER             PSL BITS AFFECTED
0039   7603 ;
0039   7604 ;          1            IPL_WB                      20:16
0039   7605 ;          2            PREV_WB                     23:22
0039   7606 ;          3            PREV_CUR.ISCUR_WB           26:22
0039   7607 ;
0039   7608 ;
0039   7609 ; LOGIC DESCRIPTION:
0039   7610 ;
0039   7611 ;       This test exercises only those Processor Status Longword bits which
0039   7612 ;       reside in the "INT" Gate Array.  Previous tests of the PSL Register
0039   7613 ;       have almost totally checked out the related logic.  Any failures in
0039   7614 ;       this test would have to be due to the INT Decode logic. (I hope!)
0039   7615 ;
0039   7616 ;
0039   7617 ; ASSUMPTIONS:
0039   7618 ;
0039   7619 ;       THIS TEST ASSUMES THE WBUS AND DPM ARE OPERATIONAL
0039   7620 ;
0039   7621 ;
0039   7622 ; ERROR DESCRIPTION:
0039   7623 ;

001B  8060 ;*******************************************************************************
001B  8061 ;++
001B  8062 ;
001B  8063 ; FUNCTIONAL DESCRIPTION
001B  8064 ;
001B  8065 ;       This test consists of two subtests that check the circuitry associated
001B  8066 ;       with the ALKC Flag in the ALK Gate Array.The first subtest executes
001B  8067 ;       eight ALPCTL Field patterns with the ALKC Flag clear.The second subtest
001B  8068 ;       executes ten ALPCTL Field patterns with the ALKC Flag set.These
001B  8069 ;       patterns were derived from the XLOG Simulator and are reproduced after
001B  8070 ;       the test data.
001B  8071 ;
001B  8072 ; TEST ALGORITHM
001B  8073 ;
001B  8074 ;       SUBTEST 1
001B  8075 ;
001B  8076 ;       1. Load the micro words to perform the test.
001B  8077 ;       2. Execute the micro sequence.
001B  8078 ;               1. Clear the ALKC Flag by adding zero to zero.
001B  8079 ;               2. Execute the test micro word.
001B  8080 ;               3. Read ALKC Flag onto WBUS and into RDM.
001B  8081 ;       3. Check the results of the WBUS read.
001B  8082 ;
001B  8083 ;
001B  8084 ;       SUBTEST 2
001B  8085 ;
001B  8086 ;       1. Load the micro words to perform the test.
001B  8087 ;       2. Execute the micro sequence.
001B  8088 ;               1. Set the ALKC Flag by adding C0000000 to C0000000.
001B  8089 ;               2. Execute the test micro word.
001B  8090 ;               3. Read ALKC Flag onto WBUS and into RDM.
001B  8091 ;       3. Check the results of the WBUS read.

001B  8410 ;*******************************************************************************
001B  8411 ;++
001B  8412 ;
001B  8413 ; FUNCTIONAL DESCRIPTION
001B  8414 ;
001B  8415 ;       This test, which consists of three subtests, checks the ALU shift and
001B  8416 ;       Q Register shift functions of the ALK Gate Array Chip. This test has no
001B  8417 ;       ALU Flags set.
001B  8418 ;
001B  8419 ; TEST ALGORITHM
001B  8420 ;
001B  8421 ;       SUBTEST 1
001B  8422 ;
001B  8423 ;       1. Load the micro words to perform the test.
001B  8424 ;       2. Setup a loop of eighteen iterations.
001B  8425 ;       3. Load appropriate micro fields.
001B  8426 ;       4. Execute the micro sequence.
001B  8427 ;               1. Condition the DPM with data from Tables 1 thru .
001B  8428 ;               2. Test the DPM with data from Tables 1 thru .
001B  8429 ;               3. Read WBUS into RDM.
001B  8430 ;       5. Check the results of the WBUS read.
001B  8431 ;       6. Looped eighteen times? If not go to step three.
001B  8432 ;
001B  8433 ;       SUBTEST 2
001B  8434 ;
001B  8435 ;       1. Load the micro words to perform the test.
001B  8436 ;       2. Setup a loop of eighteen iterations.
001B  8437 ;       3. Load appropriate micro fields.
001B  8438 ;       4. Execute the micro sequence.
001B  8439 ;               1. Condition the DPM with data from Tables 1 thru .
001B  8440 ;               2. Test the DPM with data from Tables 1 thru .
001B  8441 ;               3. Read WBUS into RDM.
001B  8442 ;       5. Check the results of the WBUS read (Q Register).
001B  8443 ;       6. Looped eighteen times? If not go to step three.
001B  8444 ;
001B  8445 ;       SUBTEST 3
001B  8446 ;
001B  8447 ;       1. Load the micro words to perform the test.
001B  8448 ;       2. Setup a loop of eighteen iterations.
001B  8449 ;       3. Load appropriate micro fields.
001B  8450 ;       4. Execute the micro sequence.
001B  8451 ;               1. Condition the DPM with data from Tables 1 thru .
001B  8452 ;               2. Test the DPM with data from Tables 1 thru .
001B  8453 ;               3. Read WBUS into RDM.
001B  8454 ;       5. Check the results of the WBUS read (D Register).
001B  8455 ;       6. Looped eighteen times? If not go to step three.

001B  8481 ;
001B  8482 ; LOGIC DESCRIPTION
001B  8483 ;
001B  8484 ;This test checks the ALK Gate Array's gates for proper operation. These
001B  8485 ;patterns were developed using the XLOG Simulator.
001B  8486 ;
001B  8487 ;The following display is the simulator output,with additions to make it more
001B  8488 ;legible. The AMUX and BMUX represent the two inputs to the ALU. The PSLC_H
001B  8489 ;input represents the PSL 'C' bit, QMSB_H represents the Most Significant Bit
001B  8490 ;of the Q Register while QR00_H represents the LSB of the Q Register. ALU31_H
001B  8491 ;represents the MSB of the ALU and ALU00_H equals the LSB of the ALU. ROT_5_H
001B  8492 ;thru ROT_0_H are the ROTATE Field of the Micro Word. OP_9_H thru OP_0_H are
001B  8493 ;the ALPCTL Field of the Micro Word. WMUX_CONT indicates whether the WMUX
001B  8494 ;Tri-State Drivers are active for any given test. MUX, ALU and DQ CONT is the
001B  8495 ;decode of the simulator output recognizable by the Assembler. The two columns
001B  8496 ;under the ROTATE heading decode the ROTATE Field output according to the DPM
001B  8497 ;Functional Specification. The line showing ALU and some data and QREG and some
001B  8498 ;data represent the necessary data in both entities to promote a successful and
001B  8499 ;meaningful test for that particular OPCODE and ROTATE Field.
001B  8500 ;
001B  8501 ; NO FLAGS ARE SET AND OUTPUT IS ENABLED

001B  9075 ; LOGIC DESCRIPTION
001B  9076 ;
001B  9077 ;This test checks the ALK Gate Array's gates for proper operation. These
```

```
001B  9078 ;patterns were developed using the XLOG Simulator.
001B  9079 ;
001B  9080 ;The following display is the simulator output,with additions to make it more
001B  9081 ;legible. The AMUX and BMUX represent the two inputs to the ALU. The PSLC_H
001B  9082 ;input represents the PSL 'C' bit, QMSB_H represents the Most Significant Bit
001B  9083 ;of the Q Register while QR00_H represents the LSB of the Q Register. ALU31_H
001B  9084 ;represents the MSB of the ALU and ALU00_H equals the LSB of the ALU. ROT_5_H
001B  9085 ;thru ROT_0_H are the ROTATE Field of the Micro Word. OP_9_H thru OP_0_H are
001B  9086 ;the ALPCTL Field of the Micro Word. WMUX_CONT indicates whether the WMUX
001B  9087 ;Tri-State Drivers are active for any given test. MUX, ALU and DQ CONT is the
001B  9088 ;decode of the simulator output recognizable by the Assembler. The two columns
001B  9089 ;under the ROTATE heading decode the ROTATE Field output according to the DPM
001B  9090 ;Functional Specification. The line showing ALU and some data and QREG and some
001B  9091 ;data represent the necessary data in both entities to promote a successful and
001B  9092 ;meaningful test for that particular OPCODE and ROTATE Field.

001B  9488 ;*******************************************************************************
001B  9489 ;++
001B  9490 ;
001B  9491 ; FUNCTIONAL DESCRIPTION
001B  9492 ;
001B  9493 ;       This test, which consists of three subtests, continues testing the ALU
001B  9494 ;       and Q Register shift functions of the ALK Gate Array Chip.This test has
001B  9495 ;       the ALUSO and LOOP Flags set. The  D  Register output data is not valid
001B  9496 ;       for the last two tests, therefore is not shown.
001B  9497 ;
001B  9498 ; TEST ALGORITHM
001B  9499 ;
001B  9500 ;       SUBTEST 1
001B  9501 ;
001B  9502 ;       1. Load the micro words to perform the test.
001B  9503 ;       2. Setup a loop of four iterations.
001B  9504 ;       3. Load appropriate micro fields.
001B  9505 ;       4. Execute the micro sequence.
001B  9506 ;               1. Condition the DPM with data from Tables 9 and 10.
001B  9507 ;               2. Test the DPM with data from Tables 1 thru 8.
001B  9508 ;               3. Read WBUS into RDM.
001B  9509 ;       5. Check the results of the WBUS read.
001B  9510 ;       6. Looped four times? If not go to step three.
001B  9511 ;
001B  9512 ;       SUBTEST 2
001B  9513 ;
001B  9514 ;       1. Load the micro words to perform the test.
001B  9515 ;       2. Setup a loop of nine iterations.
001B  9516 ;       3. Load appropriate micro fields.
001B  9517 ;       4. Execute the micro sequence.
001B  9518 ;               1. Condition the DPM with data from Tables 9 and 10.
001B  9519 ;               2. Test the DPM with data from Tables 1 thru 8.
001B  9520 ;               3. Read WBUS into RDM.
001B  9521 ;       5. Check the results of the WBUS read (Q Register).
001B  9522 ;       6. Looped nine times? If not go to step three.
001B  9523 ;
001B  9524 ;       SUBTEST 3
001B  9525 ;
001B  9526 ;       1. Load the micro words to perform the test.
001B  9527 ;       2. Setup a loop of nine iterations.
001B  9528 ;       3. Load appropriate micro fields.
001B  9529 ;       4. Execute the micro sequence.
001B  9530 ;               1. Condition the DPM with data from Tables 9 and 10.
001B  9531 ;               2. Test the DPM with data from Tables 1 thru 8.
001B  9532 ;               3. Read WBUS into RDM.
001B  9533 ;       5. Check the results of the WBUS read (D Register).
001B  9534 ;       6. Looped nine times? If not go to step three.

001B  9551 ;
001B  9552 ; LOGIC DESCRIPTION
001B  9553 ;
001B  9554 ;This test checks the ALK Gate Array's gates for proper operation. These
001B  9555 ;patterns were developed using the XLOG Simulator.
001B  9556 ;
001B  9557 ;The following display is the simulator output,with additions to make it more
001B  9558 ;legible. The AMUX and BMUX represent the two inputs to the ALU. The PSLC_H
001B  9559 ;input represents the PSL 'C' bit, QMSB_H represents the Most Significant Bit
001B  9560 ;of the Q Register while QR00_H represents the LSB of the Q Register. ALU31_H
001B  9561 ;represents the MSB of the ALU and ALU00_H equals the LSB of the ALU. ROT_5_H
001B  9562 ;thru ROT_0_H are the ROTATE Field of the Micro Word. OP_9_H thru OP_0_H are
001B  9563 ;the ALPCTL Field of the Micro Word. DSIZE_1_H and DSIZE_0_H are the DTYPE
001B  9564 ;Field of the Micro Word. WMUX_CONT indicates whether the WMUX Tri-State
001B  9565 ;Drivers are active for any given test. MUX, ALU and DQ CONT is the decode of
001B  9566 ;the simulator output recognizable by the Assembler. The two columns under the
001B  9567 ;ROTATE heading decode the ROTATE Field output according to the DPM Functional
001B  9568 ;Specification. The line showing ALU and some data and QREG and some data
001B  9569 ;represent the necessary data in both entities to promote a successful and
001B  9570 ;meaningful test for that particular OPCODE, DSIZE and ROTATE Field.
001B  9571 ;
001B  9572 ;
001B  9573 ; LOOP AND ALUSO FLAGS ARE SET AND OUTPUT IS ENABLED

001B  9937 ;*******************************************************************
001B  9938 ;++
001B  9939 ;
001B  9940 ; FUNCTIONAL DESCRIPTION
001B  9941 ;
001B  9942 ;       This test, which consists of three subtests, continues to check the ALU
001B  9943 ;       shift and Q Register shift functions of the ALK Gate Array Chip. This
001B  9944 ;       test has the LOOP Flag set.
001B  9945 ;
001B  9946 ; TEST ALGORITHM
001B  9947 ;
001B  9948 ;       SUBTEST 1
001B  9949 ;
001B  9950 ;       1. Setup loop of four iterations.
001B  9951 ;       2. Load the micro words to perform the test.
001B  9952 ;       3. Load appropriate micro fields.
001B  9953 ;       4. Execute the micro sequence.
001B  9954 ;               1. Condition the DPM with data from Tables 1 thru 11.
001B  9955 ;               2. Test the DPM with data from Tables 1 thru 11.
001B  9956 ;               3. Read WBUS into RDM.
001B  9957 ;       5. Check the results of the WBUS read.
001B  9958 ;
001B  9959 ;       SUBTEST 2
001B  9960 ;
001B  9961 ;       1. Setup loop of four iterations.
001B  9962 ;       2. Load the micro words to perform the test.
001B  9963 ;       3. Load appropriate micro fields.
001B  9964 ;       4. Execute the micro sequence.
001B  9965 ;               1. Condition the DPM with data from Tables 1 thru 11.
001B  9966 ;               2. Test the DPM with data from Tables 1 thru 11.
001B  9967 ;               3. Read WBUS into RDM.
001B  9968 ;       5. Check the results of the WBUS read (Q Register).

001B  9989 ;
001B  9990 ; LOGIC DESCRIPTION
```

```
001B  9991 ;
001B  9992 ;This test checks the ALK Gate Array's gates for proper operation. These
001B  9993 ;patterns were developed using the XLOG Simulator.
001B  9994 ;
001B  9995 ;The following display is the simulator output,with additions to make it more
001B  9996 ;legible. The AMUX and BMUX represent the two inputs to the ALU. The PSLC_H
001B  9997 ;input represents the PSL 'C' bit, QMSB_H represents the Most Significant Bit
001B  9998 ;of the Q Register while QR00_H represents the LSB of the Q Register. ALU31_H
001B  9999 ;represents the MSB of the ALU and ALU00_H equals the LSB of the ALU. ROT_5_H
001B 10000 ;thru ROT_0_H are the ROTATE Field of the Micro Word. OP_9_H thru OP_0_H are
001B 10001 ;the ALPCTL Field of the Micro Word. DSIZE_1_H and DSIZE_0_H are the DTYPE
001B 10002 ;Field of the Micro Word. WMUX_CONT indicates whether the WMUX Tri-State
001B 10003 ;Drivers are active for any given test. MUX, ALU and DQ CONT is the decode of
001B 10004 ;the simulator output recognizable by the Assembler. The two columns under the
001B 10005 ;ROTATE heading decode the ROTATE Field output according to the DPM Functional
001B 10006 ;Specification. The line showing ALU and some data and QREG and some data
001B 10007 ;represent the necessary data in both entities to promote a successful and
001B 10008 ;meaningful test for that particular OPCODE, DSIZE and ROTATE Field.
001B 10009 ;
001B 10010 ; LOOP FLAG IS SET AND OUTPUT IS ENABLED

002D                    .SBTTL  "TEST   033     Rotator Test  1 SBUS Data Integrity Test
002D 10268 ;*****************************************************************************
002D 10269 ;++
002D 10270 ;
002D 10271 ; FUNCTIONAL DESCRIPTION
002D 10272 ;
002D 10273 ;       This test passes 12 patterns through the Rotator to examine the SBUS.
002D 10274 ;
002D 10275 ; TEST ALGORITHM
002D 10276 ;
002D 10277 ;       This test is implemented in two subtests. The first subtest passes 6
002D 10278 ;       stuck at zero or one test patterns unrotated through the SBUS, while
002D 10279 ;       the second subtest passes the same patterns rotated right by 0, 1, 2
002D 10280 ;       and 3 bits through the SBUS to check the connections to the ALP slices.
002D 10281 ;       The algorithms for each subtest are specified below:
002D 10282 ;
002D 10283 ;       Subtest 1
002D 10284 ;
002D 10285 ;       1. Setup a loop of six iterations.
002D 10286 ;       2. Generate a stuck at 1 or 0 pattern.
002D 10287 ;       3. Load the WDREG with the pattern.
002D 10288 ;       4. Execute the micro-sequence:
002D 10289 ;               1. Zero out the PLATCH.
002D 10290 ;               2. Load RTEMP0 with the test pattern.
002D 10291 ;               3. Source RTEMP0 onto the SBUS, pass it directly from the
002D 10292 ;                  ALU BMUX to the WBUS and read it back into the RDM.
002D 10293 ;       5. Check the results of the test.
002D 10294 ;       6. Loop back until done.
002D 10295 ;
002D 10296 ;       NOTE -  Micro-sequence step 3 uses the ALPCTL/WX_S.Q_0 micro-order to
002D 10297 ;               bypass the ALP ALU.
002D 10298 ;
002D 10299 ;       Subtest 2
002D 10300 ;
002D 10301 ;        1. Start signature analysis.
002D 10302 ;        2. Load the K index with 1.
002D 10303 ;        3. Set up a loop of 4 iterations on I.
002D 10304 ;        4. Prepare the micro-instruction at 10$ to load the PLATCH with a test
002D 10305 ;           value from the table at 3$ indexed by I.
002D 10306 ;        5. Load the test micro-instruction into DCS.
002D 10307 ;        6. Set up a loop of 6 iterations on J.
002D 10308 ;        7. Based on the value of J, generate a standard stuck at zero or one
002D 10309 ;           test pattern and place it into 1$.
002D 10310 ;        8. Load the test pattern from 1$ into WDREG.
002D 10311 ;        9. Loop on error from here.
002D 10312 ;       10. Execute the micro-code to:
002D 10313 ;               1. Load the PLATCH with the value given in step 4.
002D 10314 ;               2. Load RTEMP0 with the data in the WDREG.
002D 10315 ;               3. Execute a ROT/RR.RR.P micro-order and read the result back
002D 10316 ;                  to the WHREG.
002D 10317 ;       11. Compare the data in the WHREG with the expected data from the table
002D 10318 ;           at 2$ indexed by K.
002D 10319 ;       12. If the expected and received data is not the same, issue an error.
002D 10320 ;       13. Increment the index K.
002D 10321 ;       14. Loop back to step 6 until all six patterns have been tried.
```

```
002D 10322 ;       15. Loop back to step 3 until all four PLATCH values have been tried.
002D 10323 ;       16. Stop signature analysis.
002D 10324 ;
002D 10325 ; TEST DATA
002D 10326 ;
002D 10327 ;       For Subtest 1 six stuck at zero or one test patterns are used:
002D 10328 ;
002D 10329 ;              AAAAAAAA
002D 10330 ;              55555555

002D 10366 ; LOGIC DESCRIPTION
002D 10367 ;
002D 10368 ;       The Rotator's SBUS is checked for data integrity. The SBUS is generated
002D 10369 ;       by the SRM gate array bit slices and is sent to the ALP bit slices,
002D 10370 ;       where it can be driven out onto the WBUS.
002D 10371 ;
002D 10372 ; ASSUMPTIONS
002D 10373 ;
002D 10374 ;       This test requires an operational RBUS, SBUS and WBUS.
002D 10375 ;       The ALP special function WMUX <- BMUX must also work.
002D 10376 ;
```

```

0020 10520 ;*******************************************************************************
0020 10521 ;++
0020 10522 ;
0020 10523 ; FUNCTIONAL DESCRIPTION
0020 10524 ;
0020 10525 ;       This test checks the rotator's position latch (PLATCH).
0020 10526 ;
0020 10527 ; TEST ALGORITHM
0020 10528 ;
0020 10529 ;       1. Set up a loop of six iterations.
0020 10530 ;       2. Generate a stuck at zero or one pattern.
0020 10531 ;       3. Load the pattern into the RDM WDREG.
0020 10532 ;       4. Execute the micro-sequence:
0020 10533 ;               1. Write the PLATCH from the RDM's WDREG.
0020 10534 ;               2. Read the PLATCH back into the RDM's WHREG.
0020 10535 ;       5. Check the results of the PLATCH test.
0020 10536 ;       6. Continue the loop until all the patterns have been tried.
0020 10537 ;
0020 10538 ; TEST DATA
0020 10539 ;
0020 10540 ;       This test uses the lower six bits of the standard stuck at zero or one
0020 10541 ;       test patterns.
0020 10542 ;
0020 10543 ;           Pattern Generated           Expected PLATCH contents

0032        .SBTTL  "TEST   036     Rotator Test  4 PLATCH 4:3 gets WBUS 1:0 Test
0032 10732 ;*******************************************************************************
0032 10733 ;++
0032 10734 ;
0032 10735 ; FUNCTIONAL DESCRIPTION
0032 10736 ;
0032 10737 ;       This test checks that PLATCH<4:3> is loaded with WBUS<1:0> while
0032 10738 ;       PLATCH<5, 2:0> is unchanged.
0032 10739 ;
0032 10740 ; TEST ALGORITHM
0032 10741 ;
0032 10742 ;       1. Setup a loop of six iterations.
0032 10743 ;       2. Generate a stuck at 1 or 0 pattern.
0032 10744 ;       3. Load the WDREG with the pattern.
0032 10745 ;       4. Execute the micro-sequence:
0032 10746 ;               1. Zero out the PLATCH.
0032 10747 ;               2. Load PLATCH<4:3> with the test pattern.
0032 10748 ;               3. Read the PLATCH from the rotator to the RDM.
0032 10749 ;       5. Check the results of the test.
0032 10750 ;       6. Loop back until done.
0032 10751 ;
0032 10752 ; TEST DATA
0032 10753 ;
0032 10754 ;       This test uses the lower six bits of the standard stuck at zero or one
0032 10755 ;       test patterns.
0032 10756 ;
0032 10757 ;           Pattern Generated           Expected PLATCH contents
0032 10758 ;
0032 10759 ;               AAAAAAAA                        10

Pass 2	6930	00:00:42.94	00:01:38.88
Symbol table output	2	00:00:00.18	00:00:00.79
Psect synopsis output	3	00:00:00.40	00:00:00.62
Cross-reference output	0	00:00:00.00	00:00:00.00
Assembler run totals	14895	00:03:14.99	00:08:33.63

The working set limit was 4096 pages.
2848330 bytes (5564 pages) of virtual memory were used to buffer the intermediate code.
There were 40 pages of symbol table space allocated to hold 381 non-local and 418 local symbols.
11586 source lines were read in Pass 1, producing 399 object records in Pass 2.
99 pages of virtual memory were used to define 45 macros.

Macro library statistics

Macro library name	Macros defined
DISK$UCODPACK00:[VAX750]COMETMAC.MLB;805	45
SYS$COMMON:[SYSLIB]STARLET.MLB;2	0
TOTALS (all libraries)	45

1906 GETS were required to define 45 macros.

There were 0 errors, 4 warnings and 0 information messages, on lines:

0000     27 ;
0000     28 ; REVISION HISTORY
0000     29 ;
0000     30 ; 00-01 Tom Groetzinger 4-FEB-1980
0000     31 ;       Started file.
0000     32 ;
0000     33 ; 00-02 Dave Spain      27-FEB-1980
0000     34 ;       Added CS BUS INTEGRITY test.
0000     35 ;
0000     36 ; 00-03 Tom Groetzinger 12-MAR-1980
0000     37 ;       Added five tests.
0000     38 ;
0000     39 ; 00-04 Tom Groetzinger 17-MAR-1980
0000     40 ;       Added SRK,SRM callouts to some tests.
0000     41 ;
0000     42 ; 00-05 Tom Groetzinger 17-MAR-1980
0000     43 ;       Improved tests 7 and 16 to increase coverage due to Westboro feedback
0000     44 ;
0000     45 ; 00-06 Tom Groetzinger 17-MAR-1980
0000     46 ;       Debugged test 16 dueu to major rewrite
0000     47 ;
0000     48 ; 00-07 Tom Groetzinger 17-MAR-1980
0000     49 ;       Added 9 Super Rotator tests
0000     50 ;
0000     51 ; 01-08 Dave Spain       4-APR-80
0000     52 ;       Added 4 Micro-sequencer tests for offical release.
0000     53 ;
0000     54 ; 01-09 Bill Landry     4-APR-1980
0000     55 ;       Added the XB, PREFETCH and IRD tests from ECKAC.SRC so
0000     56 ;       manufacturing can run one tape for DPM.
0000     57 ;
0000     58 ; 00-10 Bill Landry     4-APR-1980
0000     59 ;       Let's save version 1.0 for our first SDC release.
0000     60 ;
0000     61 ; 00-11 Tom Groetzinger 7-APR-1980
0000     62 ;       Added 2 ALK Tests
0000     63 ;
0000     64 ; 00-12 Tom Groetzinger 8-APR-1980
0000     65 ;       Deleted last 2 D Register outputs from ALK Test #6
0000     66 ;
0000     67 ; 00-13 Tom Groetzinger 14-APR-1980
0000     68 ;       Added D Register output to ALK test #6
0000     69 ;
0000     70 ; 00-14 Dave Spain      25-APR-1980
0000     71 ;       Changed mask on the micro-sequencer tests to ignore bit 13 of the
0000     72 ;       Control Store address.
0000     73 ;
0000     74 ; 00-15 Dave Spain      28-APR-1980
0000     75 ;       Fixed bug in ALK Tests 6 and 7 by replacing VSIZE/1 micro order with a
0000     76 ;       SIZE[LONG] macro in micro words 6 and 3 respectively.
0000     77 ;
0000     78 ; 00-16 Dave Spain      29-APR-1980
```

```
0000     79 ;       Changed mask on CS address for Instruction Address Decode test from
0000     80 ;       3FFF to 1FFF to ignore bit 13 of Control Store address.
0000     81 ;
0000     82 ; 00-17 Dave Spain      30-APR-1980
0000     83 ;       Added CCS module to error callout for Control Store Bus Integrity test.
0000     84 ;
0000     85 ; 00-18 Dave Spain       9-MAY-1980
0000     86 ;       Added SRM gate array to error callout routine in RTMP0 and RTEMP
0000     87 ;       Sratchpad tests.
0000     88 ;
0000     89 ; 00-19 Bill Landry     10-JUN-1980
0000     90 ;       Added RDM tests to beginning of tape
0000     91 ;
0000     92 ; 01-00 Bill Landry/Dave Spain  13-JUN-1980
0000     93 ;       Added macro file to title section and compatibility mode IRD tests
0000     94 ;       then submitted to RELEASE ENGINERRING.
0000     95 ;
0000     96 ; 01-01 Dave Spain      19-JUN-1980
0000     97 ;       Fixed prefetch incrementer test to clear out cache data after every
0000     98 ;       prefetch. This will prevent the test from mistaking bad addresses from
0000     99 ;       good ones.
0000    100 ;
0000    101 ; 01-02 Dave Spain       2-JUL-1980
0000    102 ;       Added CM Second IRDX tests to file.
0000    103 ;
0000    104 ; 01-03 Dave Spain      18-AUG-1980
0000    105 ;       Added CM branch test to file.
0000    106 ;
0000    107 ; 01-04 Dave Spain      10-SEPT-1980
0000    108 ;       Fixed "DEFAULT MTEMP0 TEST"
0000    109 ;
0000    110 ; 01-05 Bill Landry     11-SEPT-1980
0000    111 ;       Revised RDM to CMI tests
0000    112 ;
0000    113 ; 02-00 Dave Spain      28-SEPT-1980
0000    114 ;       Added rotator tests to file and submitted to SDC.
0000    115 ;
0000    116 ; 02-01 Dave Spain      28-OCT-1980
0000    117 ;       Added QV flag to tests to be run by manufacturing.
0000    118 ;
0000    119 ; 02-02 Bill Landry     10-NOV-1980
0000    120 ;       Added tests for TOK and SAC gate arrays.
0000    121 ;
0000    122 ; 02-03 Bill Landry     13-NOV-1980
0000    123 ;       Added test of REI CHECK
0000    124 ;
0000    125 ; 03-00 Dave Spain      17-NOV-1980
0000    126 ;       Added rotator tests 23-28 and released to SDC.
0000    127 ;
0000    128 ; 03-01 Dave Spain      10-DEC-1980
0000    129 ;       Added rotator tests 29-42.
0000    130 ;
0000    131 ; 03-02 Bill Landry     11-DEC-1980
0000    132 ;       Fixed bug in CS ADDRESS test
0000    133 ;
```

```
0000   134 ; 03-03 Dave Spain      12-DEC-1980
0000   135 ;       Enhanced Rotator Test 1 to call out ALP slices.
0000   136 ;
0000   137 ; 03-04 Bill Landry     16-DEC-1980
0000   138 ;       Added DSIZE ROM tests
0000   139 ;
0000   140 ; 03-05 Bill Landry     31-DEC-1980
0000   141 ;       Last great act of 80. Separated DPM and RDM tests into two files.
0000   142 ;
0000   143 ; 04-00 Bill Landry     5-JAN-1981
0000   144 ;       Submitted to RELEASE ENGINERRING
0000   145 ;
0000   146 ; 04-01 Bill Landry     14-JAN-1981
0000   147 ;       Revised INTERVAL TIMER INTERRUPT TEST to fix bug caused by INT PEND
0000   148 ;       ECO
0000   149 ;
0000   150 ; 04-02 Dave Spain      16-JAN-1981
0000   151 ;       Fixed error callout in CS Parity Error, XB, and Prefetch Incrementer
0000   152 ;       tests and added seven new rotator tests.
0000   153 ;
0000   154 ; 04-03 Bill Landry     4-FEB-1981
0000   155 ;       Added tests for CCC gate array
0000   156 ;
0000   157 ; 04-04 Dave Spain      9-FEB-1981
0000   158 ;       Changed the names of rotator tests 23-33.
0000   159 ;
0000   160 ; 04-05 Bill Landry     24-FEB-1981
0000   161 ;       Added tests for DPM discrete branching logic.
0000   162 ;
0000   163 ; 04-06 Bill Landry     27-FEB-1981
0000   164 ;       Added tests for branching logic in PHB gate array.
0000   165 ;
0000   166 ; 05-00 Dave Spain       1-MAR-1981
0000   167 ;       Added 5 SRK status rotator tests and submitted to SDC.
0000   168 ;
0000   169 ; 05-01 Dave Spain      25-MAR-1981
0000   170 ;       Fixed a loop on test bug in the Alu Functions Test by adding a LDFIELD
0000   171 ;       pseudo-op that reinitializes the ROT field in Subtest 1.
0000   172 ;
0000   173 ; 05-02 Bill Landry     25-MAR-1981
0000   174 ;       Fixed bug in BUT/NO.FPA test.  I was branching on the wrong conditions.
0000   175 ;
0000   176 ; 05-03 Dave Spain      14-APR-1981
0000   177 ;       Cleaned up documentation for R Scratchpads Write All Cells Test.
0000   178 ;
0000   179 ; 06-00 Bill Landry     2-MAY-1981
0000   180 ;       Added SPA branching, CON registers, TU58 registers, and CCS PARITY
0000   181 ;       tests.  Submitted to Release Engineering.
0000   182 ;
0000   183 ; 06-01 Dave Spain      17-JUN-1981
0000   184 ;       Replaced the old IRD1 Instruction Address Decode test with two new
0000   185 ;       tests that toggle the PSL's FPD bit and can handle an FPA.
0000   186 ;
0000   187 ; 06-02 Bill Landry     19-AUG-1981
0000   188 ;       Fixed bugs created by introduction of FPA option.
```

```
0000    189 ;       Replaced all references to COMET with the word CPU.
0000    190 ;       Fixed typing error in vbus data of CPU CLOCK TEST.
0000    191 ;       Submitted to RELEASE ENGINEERING.
0000    192 ;
0000    193 ; 06-03 Bill Landry     24-SEPT-1981
0000    194 ;       Fixed potential clock problem with FPA in Z BIT TEST 1.
0000    195 ;
0000    196 ; 06-04 Bill Landry     9-OCT-1981
0000    197 ;       Added changes for ECO L0002-TW002
0000    198 ;
0000    199 ; 07-00 Bill Landry     31-OCT-1981
0000    200 ;       Removed changes for ECO L0002-TW002.  ECO is on hold.
0000    201 ;       Added tests for FPA to CPU interface logic
0000    202 ;       Moved WCS test to MIC tape
0000    203 ;       Submitted to RELEASE ENGINEERING.
0000    204 ;
0000    205 ; 07-01 Bill Landry     13-NOV-1981
0000    206 ;       Stopped release of 7.0
0000    207 ;       Added FPA TRAP LOGIC TEST
0000    208 ;       Enhanced error messages for FPA
0000    209 ;       Resubmitted to RELEASE ENGINEERING
0000    210 ;
0000    211 ; 07-02 Bill Landry     20-NOV-1981
0000    212 ;       Stopped release of 7.1
0000    213 ;       Enhanced FPA ENABLE/DISABLE TEST to check for MSEQ INIT
0000    214 ;       Resubmitted to RELEASE ENGINEERING
0000    215 ;
0000    216 ; 07-03 Dave Shull      26-Mar-1982
0000    217 ;       Added the ERRLOOP pseudo to the Rotator Extract tests which were
0000    218 ;       missing these and couldn't be looped on.
0000    219 ;
0000    220 ; 07-04 Dave Shull      05-Apr-1982
0000    221 ;       Removed all BEGINSA and ENDSA pseudo's.
0000    222 ;       Submitted to RELEASE ENGINEERING
0000    223 ;
0000    224 ; 07-05 Dave Shull      21-May-1982
0000    225 ;       Add a subtest to the Micro Sequencer Stack Test that will test bits
0000    226 ;       11 and 12 of the micro stack.
0000    227 ;
0000    228 ; 07-06 Dave Shull      24-May-1982
0000    229 ;       Changed documentation in the CM Odd Address BUT Test to reflect the
0000    230 ;       ECO L0002-TW002
0000    231 ;
0000    232 ; 08-00 Dave Shull      18-Jun-1982
0000    233 ;       Added 10 new tests.  Two of those tests are an addition to the existing
0000    234 ;       IRD1 rom tests.  These 2 new tests check the signal ROM OS INH H.
0000    235 ;       The other 8 new tests check the validity of the IRDX ROMs.  They check
0000    236 ;       both the address and the signal ROM OS INH H.
0000    237 ;
0000    238 ; 08-01 Dave Shull      22-Jun-1982
0000    239 ;       Added a subtest to the Register Backup Stack test that will check the
0000    240 ;       bit that records Increment/Decrement of the GPR.
0000    241 ;
0000    242 ; 09-00 Dave Shull      03-Nov-1982
0000    243 ;       Added two new Tests for coverage the new PCS (L0008) module.
```

```
0000    244 ;
0000    245 ; 09-01 Dave Smith      15-May-1983
0000    246 ;       Correct DCS in ALK test 3,6,7. Disabled ALP's on the WBUS.
0000    247 ;--
0000      1         .SBTTL  ""

0000     3          .SBTTL  "DIAGNOSTIC MICROCODE MACROS"
0000     4 ;++
0000     5 ; Revision History
0000     6 ;
0000     7 ; 28    Dave Spain      22-Jun-82
0000     8 ;       Removed LOAD FPA SIGN REG and LOAD FPA SIGN REGS macros.
0000     9 ;       Decided not to use them.
0000    10 ;
0000    11 ; 27    Dave Spain      15-Jun-82
0000    12 ;       Added LOAD FPA SIGN REG and LOAD FPA SIGN REGS macros.
0000    13 ;
0000    14 ; 26    Dave Spain      19-May-82
0000    15 ;       Added M[]_FPA macro.
0000    16 ;
0000    17 ; 25    Rich Lewis      23-Feb-82
0000    18 ;       Added PSL_WB, M[]_R[].OR.NIB0(M), WB_FPA CCR, WB_FPA TCR, Q_R[].ASL.P,
0000    19 ;       RDM_M[].XZ.OR.R[], FPA_WB macros
0000    20 ;
0000    21 ; 24    Dave Spain      02-Feb-82
0000    22 ;       Added FPA_R[]+M[] macro.
0000    23 ;
0000    24 ; 23    Bill Landry     22-OCT-81
0000    25 ;       Added PSL_RDM macro
0000    26 ;
0000    27 ; 22    Dave Spain       5 Oct 81
0000    28 ;       Added RDM_FPA and FPA_M[] FPA_RDM macros.
0000    29 ;
0000    30 ; 21    Bill Landry     29 Sept 81
0000    31 ;       Added FPA macro, FPA_M[] FPA_R[].
0000    32 ;
0000    33 ; 20    Dave Spain      14 Aug 81
0000    34 ;       Added the TESTFPA [] macro.
0000    35 ;
0000    36 ; 19    Dave Spain      18 July 81
0000    37 ;       Added the following FPA macros, FPA_RDM and FPA_R[].
0000    38 ;
0000    39 ; 18    Dave Spain      24 Sept 80
0000    40 ;       Added RDM_Q macro. This macro uses the ALU.
0000    41 ;
0000    42 ; 17    Bill Landry     23 Sept 80
0000    43 ;       Added macro VA_VA-ZLIT0[] for testing memory in decending order.
0000    44 ;
0000    45 ; 16    Dave Spain      27 August 80
0000    46 ;       Changed RDM_Q macro to RDM_Q Q_D. This more accurately reflects macro.
0000    47 ;
0000    48 ; 15    Bill Landry     4 June 80
0000    49 ;       Deleted BUS/PRB.RD.PTE from macro CLRTB.VA_VA and CLRCH.VA_VA to
0000    50 ;       satisfy validity checks.
0000    51 ;
0000    52 ; 14    Dave Spain      23 May 80
0000    53 ;       Added BUS/PRB.RD.PTE to the clear cache and clear TB macros for Mr.
0000    54 ;       Bill.
0000    55 ;
0000    56 ; 13    Dave Spain      14 Apr 80
0000    57 ;       Added SIZE[] or VSIZE/1 to some macros. This allows version 65 of
```

```
0000     58 ;        the COMET micro-code defines to run.
0000     59 ;
0000     60 ; 12     Bill Landry       1 Apr 80
0000     61 ;        Added BUS/PRB.RD micro order to RDM_TB macro to compensate for timing
0000     62 ;        problem in ADD gate array.  This is not an APRIL FOOL!
0000     63 ;
0000     64 ; 11     Dave Spain       27 Mar 80
0000     65 ;        Fixed TB macro's to include MSRC/VA to prevent validity failure.
0000     66 ;
0000     67 ; 10     Bill Landry      19 Mar 80
0000     68 ;        Added Q_R[].RL.P and VA_Q.OR.R[]
0000     69 ;
0000     70 ; 09     Bill Landry      19 Mar 80
0000     71 ;        Deleted TB_R[].RL.P.OR.D
0000     72 ;
0000     73 ; 08     Bill Landry      18 Mar 80
0000     74 ;        Added VA_R[].RL.P
0000     75 ;
0000     76 ; 07     Bill Landry      07 Mar 80
0000     77 ;        Added Q_M[].RL.PTE
0000     78 ;
0000     79 ; 06     Dave Spain       06 Mar 80
0000     80 ;        Changed TB_R[].RL.P macro to TB_R[].RL.P.OR.D.
0000     81 ;
0000     82 ; 05     Dave Spain       03 Mar 80
0000     83 ;        Added TB_R[].RL.P macro for Bill Landry.
0000     84 ;
0000     85 ; 04     Dave Spain       22 Feb 80
0000     86 ;        Added CLRTB.VA_R[] macro for Bill Landry.
0000     87 ;
0000     88 ; 03     Dave Spain       30 Jan 80
0000     89 ;        Added Tom Groetzinger's macro definitions.
0000     90 ;
0000     91 ; 02     Dave Spain       30 Jan 80
0000     92 ;        Added Tony Vezza's macro definitions.
0000     93 ;
0000     94 ; 01     Dave Spain       29 Jan 80
0000     95 ;        Macros initiated.

0045    117 ;*****************************************************************************
0045    118 ;++
0045    119 ;
0045    120 ; FUNCTIONAL DESCRIPTION
0045    121 ;
0045    122 ;       This test checks to see if the SLATCH writes to the SBUS when the
0045    123 ;       PLATCH is written from the WBUS.
0045    124 ;
0045    125 ; TEST ALGORITHM
0045    126 ;
0045    127 ;       1. Setup a loop of six iterations.
0045    128 ;       2. Generate a standard stuck at zero or one test pattern.
0045    129 ;       3. Load the pattern into the RDM's WDREG.
0045    130 ;       4. Execute the micro-sequence:
0045    131 ;               1. Zero the SLATCH.
0045    132 ;               2. Load the SLATCH with the test pattern.
0045    133 ;               3. Use the ALPCTL field to enable the SBUS onto the WBUS while
0045    134 ;                  the rotator is performing a SL.PL_WB micro-order.
0045    135 ;               4. Read the PLATCH into the RDM.
0045    136 ;       5. Check the result.
0045    137 ;       6. Loop back until done.

0029    703 ;++
0029    704 ;
0029    705 ; FUNCTIONAL DESCRIPTION
0029    706 ;
0029    707 ;       This test examines the rotator's ability to generate a zero extended
0029    708 ;       constant of 1, 2, or 4 as a function of DSIZE. For this test DSIZE is
0029    709 ;       determined by the DTYPE field.
0029    710 ;
0029    711 ;       This test can only do checks for byte, word, and longword data types.
0029    712 ;       Quadword data types must wait until after the test of the DSIZE ROM.

0029    714 ; TEST ALGORITHM
0029    715 ;
0029    716 ;       This test has been divided up into two subtests. The first subtest
0029    717 ;       examines the DSIZE constant function with ones on the RBUS and MBUS,
0029    718 ;       while the second subtest examines the DSIZE constant function with ones
0029    719 ;       in the LITRL field.
0029    720 ;
0029    721 ;       Subtest 1
0029    722 ;
0029    723 ;       1. Setup a loop of three iterations.
0029    724 ;       2. Load the DTYPE field of a test micro-instruction for a byte, word or
0029    725 ;          longword data type.
0029    726 ;       3. Load the test micro-instruction into DCS.
0029    727 ;       4. Execute the following micro-sequence:
0029    728 ;             1. Placing ones on the RBUS and MBUS, try to run the DSIZE
0029    729 ;                constant from the SBUS to the WBUS and into the RDM.
0029    730 ;       5. Check the result.
0029    731 ;       6. Loop until done.
0029    732 ;
0029    733 ;       Subtest 2
0029    734 ;
0029    735 ;       1. Setup a loop of three iterations.
0029    736 ;       2. Load the DTYPE field of a test micro-instruction for a byte, word or
0029    737 ;          longword data type.
0029    738 ;       3. Load the test micro-instruction into DCS.
0029    739 ;       4. Execute the following micro-sequence:
0029    740 ;             1. Placing ones in the LITRL field, try to run the DSIZE
0029    741 ;                constant from the SBUS to the WBUS and into the RDM.
0029    742 ;       5. Check the result.
0029    743 ;       6. Loop until done.

0035          .SBTTL  "TEST   043     Rotator Test 17 Extract Virtual Page Number Test
0035  1641 ;*****************************************************************************
0035  1642 ;++
0035  1643 ;
0035  1644 ; FUNCTIONAL DESCRIPTION
0035  1645 ;
0035  1646 ;       This test examines the rotator function used to extract the VPN field
0035  1647 ;       from a virtual address. A 21 bit field is extracted from MBUS <29:09>
0035  1648 ;       and is driven out on SBUS <20:00>. The remainder of the SBUS is zero
0035  1649 ;       extended.
0035  1650 ;
0035  1651 ; TEST ALGORITHM
0035  1652 ;
0035  1653 ;       1. Setup a loop of six iterations.
0035  1654 ;       2. Generate a stuck at zero or one test pattern.
0035  1655 ;       3. Load the test pattern into the RDM's WDREG.
0035  1656 ;       4. Execute the following micro-sequence:
0035  1657 ;               1. Load the test pattern from WDREG into MTEMP0.
0035  1658 ;               2. Execute the VPN extract on MTEMP0 and read the result back
0035  1659 ;                  into the RDM's WHREG.
0035  1660 ;       5. Check the result and signal an error if wrong.
0035  1661 ;       6. Loop back until done.
0035  1662 ;
0035  1663 ; TEST DATA
0035  1664 ;
0035  1665 ;       Because SBUS<20:00> <- MBUS <29:09> and SBUS<31:21> <- 0 the results
0035  1666 ;       read back will be different from the standard test patterns read in.
0035  1667 ;
0035  1668 ;       Below is a table which shows what the expected data will be:
0035  1669 ;
0035  1670 ;           MBUS Test Pattern      Expected SBUS Results
0035  1671 ;

0032  2496 ;*******************************************************************************
0032  2497 ;++
0032  2498 ;
0032  2499 ; FUNCTIONAL DESCRIPTION
0032  2500 ;
0032  2501 ;       The test examines the rotator's ability to do right circular rotation
0032  2502 ;       of the data on the RBUS. It is implemented in two subtests. The first
0032  2503 ;       subtest examines the second level shifter inside the ALP gate array
0032  2504 ;       while the second subtest examines the byte rotator inside the SRM chip.
0032  2505 ;
0032  2506 ; TEST ALGORITHM
0032  2507 ;
0032  2508 ;       Subtest 1
0032  2509 ;
0032  2510 ;       This subtest examines the second level shifter inside the ALP chip.
0032  2511 ;
0032  2512 ;        1. Load the K index with 1.
0032  2513 ;        2. Start signature analysis.
0032  2514 ;        3. Set up a loop of 4 iterations on I.
0032  2515 ;        4. Prepare the micro-instruction at 10$ to load the PLATCH with a test
0032  2516 ;           value from the table at 3$ indexed by I.
0032  2517 ;        5. Load the test micro-instruction into DCS.
0032  2518 ;        6. Set up a loop of 6 iterations on J.
0032  2519 ;        7. Based on the value of J, generate a standard stuck at zero or one
0032  2520 ;           test pattern and place it into 1$.
0032  2521 ;        8. Load the test pattern from 1$ into WDREG.
0032  2522 ;        9. Loop on error from here.
0032  2523 ;       10. Execute the micro-code to:
0032  2524 ;               1. Load the PLATCH with the value given in step 4.
0032  2525 ;               2. Load RTEMP0 with the data in the WDREG.
0032  2526 ;               3. Execute a ROT/RR.RR.P micro-order and read the result back
0032  2527 ;                  to the WHREG.
0032  2528 ;       11. Compare the data in the WHREG with the expected data from the table
0032  2529 ;           at 2$ indexed by K.
0032  2530 ;       12. If the expected and received data is not the same, issue an error.
0032  2531 ;       13. Increment the index K.
0032  2532 ;       14. Loop back to step 6 until all six patterns have been tried.
0032  2533 ;       15. Loop back to step 3 until all four PLATCH values have been tried.
0032  2534 ;       16. Stop signature analysis.
0032  2535 ;
0032  2536 ;       Subtest 2
0032  2537 ;
0032  2538 ;       This subtest examines the first level shifter inside the SRM chip.
0032  2539 ;
0032  2540 ;        1. Load the K index with 1.
0032  2541 ;        2. Start signature analysis.
0032  2542 ;        3. Set up a loop of 7 iterations on I.
0032  2543 ;        4. Prepare the micro-instruction at 10$ to load the PLATCH with a test
0032  2544 ;           value from the table at 5$ indexed by I.
0032  2545 ;        5. Load the test micro-instruction into DCS.
0032  2546 ;        6. Set up a loop of 6 iterations on J.
0032  2547 ;        7. Based on the value of J, generate a standard stuck at zero or one
0032  2548 ;           test pattern and place it into 1$.
0032  2549 ;        8. Load the test pattern from 1$ into WDREG.
```

```
0032  2550 ;       9. Loop on error from here.
0032  2551 ;      10. Execute the micro-code to:
0032  2552 ;              1. Load the PLATCH with the value given in step 4.
0032  2553 ;              2. Load RTEMP0 with the data in the WDREG.
0032  2554 ;              3. Execute a ROT/RR.RR.P micro-order and read the result back
0032  2555 ;                 to the WHREG.
0032  2556 ;      11. Compare the data in the WHREG with the expected data from the table
0032  2557 ;          at 4$ indexed by K.
0032  2558 ;      12. If the expected and received data is not the same, issue an error.
0032  2559 ;      13. Increment the index K.
0032  2560 ;      14. Loop back to step 6 until all 6 patterns have been tried.
0032  2561 ;      15. Loop back to step 3 until all 7 PLATCH values have been tried.
0032  2562 ;      16. Stop signature analysis.
0032  2563 ;
0032  2564 ; TEST DATA
0032  2565 ;
0032  2566 ;       The data patterns input to the rotator over the RBUS are the standard
0032  2567 ;       stuck at zero or one test pattterns used in most register tests.
0032  2568 ;       The expected data consists of the same data rotated right the proper
0032  2569 ;       number of bits. By using these data patterns it is possible to find any
0032  2570 ;       stuck bit in the rotator data path as well as any bit tied to any other
0032  2571 ;       bit, even after it has undergone a rotation.
0032  2572 ;
0032  2573 ;       Subtest 1
0032  2574 ;
0032  2575 ;       Index I = PLATCH test data being used.
0032  2576 ;       Index J = Stuck at zero or one test pattern being used.
0032  2577 ;       Index K = Index to expected data table.

0032  2657 ; LOGIC DESCRIPTION
0032  2658 ;
0032  2659 ;       The right rotation data path is in the SRM and ALP gate arrays on the
```

```
                        0032  2660 ;       DPM module. The right rotation function is decoded from the ROT field
                        0032  2661 ;       of the micro-word by the SRK and ALK gate arrays also on DPM.
                        0032  2662 ;       The decoded ROT field generates the control signals SHF1L, SHF0L, PRI1
                        0032  2663 ;       and PRI0 that control the SRM and ALP.
                        0032  2664 ;
                        0032  2665 ; ASSUMPTIONS
                        0032  2666 ;
                        0032  2667 ;       This test assumes the scratchpad RTEMP0 is working as well as the RBUS
                        0032  2668 ;       SBUS, WBUS and the rotator's PLATCH.
                        0032  2669 ;
                        0032  2670 ; ERROR DESCRIPTION
                        0032  2671 ;
                        0032  2672 ;       On error Subtest 1 will call out the ALP,SRM,SRK and ALK gate arrays.
                        0032  2673 ;       On error Subtest 2 will call out the SRM and SRK gate arrays.
                        0032  2674 ;
                        0032  2675 ;       On error both subtests will type out the following information:
                        0032  2676 ;
                        0032  2677 ;       EXPECTED DATA

0032        .SBTTL  "TEST   04A     Rotator Test 24 Right Rotation of RBUS Test 2
0032  2822 ;*******************************************************************************
0032  2823 ;++
0032  2824 ;
0032  2825 ; FUNCTIONAL DESCRIPTION
0032  2826 ;
0032  2827 ;       This test examines the rotator micro-orders RR.RR.PS and RR.RR.SIZ.
0032  2828 ;       The first micro-order rotates the data on the RBUS right by the number
0032  2829 ;       of bits specified from the sum of the contents of the PLATCH and the
0032  2830 ;       SLATCH. The second micro-order right rotates the data on the RBUS by
0032  2831 ;       the number of bits specified in the DTYPE field of the test micro-
0032  2832 ;       instruction.
0032  2833 ;
0032  2834 ; TEST ALGORITHM
0032  2835 ;
0032  2836 ;       This test is implemented in three subtests. The first subtest floats a
0032  2837 ;       zero through a field of ones in the PLATCH with a constant one loaded
0032  2838 ;       into the SLATCH. It then adds the two together and uses the sum to
0032  2839 ;       right rotate the data on the RBUS by that number of bits. The second
0032  2840 ;       subtest is identical to the first, except that the floating zero is
0032  2841 ;       run through the SLATCH with a constant one loaded into the PLATCH.
0032  2842 ;       The third subtest loads the DTYPE field of the test micro-instruction
0032  2843 ;       with the three data types BYTE, WORD and LONGWORD and then checks that
0032  2844 ;       the data on the RBUS is right rotated the correct number of bytes for
0032  2845 ;       each data type. The algorithms for the subtests are given below:
0032  2846 ;
0032  2847 ;       Subtests 1 and 2
0032  2848 ;
0032  2849 ;        1. Initialize the CPU. (Subtest 1 only)
0032  2850 ;        2. Load a constant 1 into SLATCH (Subtest 1) or PLATCH (Subtest 2).
0032  2851 ;        3. Load the micro-instruction to test the P + S latch rotation.
0032  2852 ;        4. Load the index K with 1.
0032  2853 ;        5. Start signature analysis.
0032  2854 ;        6. Prepare to loop on I for 5 latch patterns.
0032  2855 ;        7. Load the RSRC field of the test micro-instruction to source TEMP0.
0032  2856 ;        8. Prepare a loop on J for 6 data patterns.
0032  2857 ;        9. Generate a test pattern based on J.
0032  2858 ;       10. Load the test pattern into the WDREG.
0032  2859 ;       11. Loop on error from here.
0032  2860 ;       12. Execute the micro-code to:
0032  2861 ;               1. Load PLATCH with a pattern (Subtest 1) or 1 (Subtest 2).
0032  2862 ;               2. Load the SLATCH with 1 (Subtest 1) or a pattern (Subtest 2).
0032  2863 ;               3. Load RTEMP0 with the test data from WDREG.
0032  2864 ;               4. Execute the test instruction and read the result to WHREG.
0032  2865 ;       13. Compare the WHREG contents with the expected data from a table
0032  2866 ;           indexed by K.
0032  2867 ;       14. If WHREG does not equal the expected data, signal an error.
0032  2868 ;       15. Increment the index K.
0032  2869 ;       16. Loop back to step 8 for rest of the data patterns.
0032  2870 ;       17. Loop back to step 6 for rest of latch patterns.
0032  2871 ;       18. End signature analysis.
0032  2872 ;
0032  2873 ;       Subtest 3
0032  2874 ;
0032  2875 ;        1. Load the index K with 1.
```

```
0032  2876 ;        2. Start signature analysis.
0032  2877 ;        3. Prepare to loop on I for 3 data types.
0032  2878 ;        4. Load a data type (either BYTE, WORD or LONG) into the DTYPE field
0032  2879 ;           of the test micro-instruction from the table at 5$ indexed by I.
0032  2880 ;        5. Load the test micro-instruction for Subtest 3 into DCS.
0032  2881 ;        6. Prepare a loop on J for 6 data patterns.
0032  2882 ;        7. Generate a standard stuck at zero or one test pattern based on J.
0032  2883 ;        8. Load the test pattern into the WDREG.
0032  2884 ;        9. Loop on error from here.
0032  2885 ;       10. Execute the micro-code to:
0032  2886 ;               1. Load RTEMP0 with the test pattern from WDREG.
0032  2887 ;               2. Rotate RTEMP0 right by DTYPE and write the result to WHREG.
0032  2888 ;       11. Compare the data in WHREG with the expected data from the table at
0032  2889 ;           6$ indexed by K.
0032  2890 ;       12. If WHREG does not equal the expected data, signal an error.
0032  2891 ;       13. Increment the index K.
0032  2892 ;       14. Continue the loop on J for the remaining data patterns.
0032  2893 ;       15. Continue the loop on I for the remaining data types.
0032  2894 ;
0032  2895 ; TEST DATA
0032  2896 ;
0032  2897 ;       The test data for Subtests 1 and 2 consist of a floating 0 pattern
0032  2898 ;       through a field of ones. This gives a good test of the SRK ALU by
0032  2899 ;       causing carries to ripple across bits <0:4> of the SLATCH and PLATCH.
0032  2900 ;       Bit <5> of the SLATCH and PLATCH is used for sign only and does not
0032  2901 ;       affect the number of bits shifted.
0032  2902 ;
0032  2903 ;       The data for Subtest 3 uses the 3 data types that can be loaded into
0032  2904 ;       the DTYPE field of the test micro-instruction; BYTE, WORD and LONG.
0032  2905 ;
0032  2906 ; LOGIC DESCRIPTION
0032  2907 ;
0032  2908 ;       The logic used to execute the right rotation of data on the RBUS is
0032  2909 ;       internal to the SRM and ALP gate arrays on the DPM module. The ALP
0032  2910 ;       gate array contains the second level shifter which can rotate data on
0032  2911 ;       the RBUS by 0,1,2 or 3 bits. The SRM contains the first level shifter
0032  2912 ;       which can rotate data on the RBUS from 0 to 7 bytes at a time. The
0032  2913 ;       SRK and ALK gate arrays are responsible for controlling the actions of
0032  2914 ;       this two level rotator.
0032  2915 ;
0032  2916 ; ASSUMPTIONS
0032  2917 ;
0032  2918 ;       This test assumes that the scratchpads RTEMP0 and MTEMP1 are working as
0032  2919 ;       well as the RBUS, SBUS, WBUS and the rotator's PLATCH and SLATCH.
0032  2920 ;
0032  2921 ; ERROR DESCRIPTION
0032  2922 ;
0032  2923 ;       On error Subtests 1 and 2 call out the SRK,SRM,ALP and ALK gate arrays.
0032  2924 ;       On error Subtest 3 will call out the SRK and SRM gate arrays.
0032  2925 ;
0032  2926 ;       On error all subtests will also type out the following data:
0032  2927 ;
0032  2928 ;       EXPECTED DATA
0032  2929 ;       RECEIVED DATA
0032  2930 ;       LOOP COUNT I

0032  3112 ;*******************************************************************************
0032  3113 ;++
0032  3114 ;
0032  3115 ; FUNCTIONAL DESCRIPTION
0032  3116 ;
0032  3117 ;       This test examines the rotator's ability to do right circular rotation
0032  3118 ;       of the data on the MBUS. This test is implemented in two subtests.
0032  3119 ;       The first subtest examines the second level shifter inside the ALP gate
0032  3120 ;       array. This is done by using PLATCH values of 0,1,2 and 3. The second
0032  3121 ;       subtest examines the first level shifter inside the SRM gate array by
0032  3122 ;       using PLATCH values of 4,8,12,16,20,24 and 28.
0032  3123 ;
0032  3124 ; TEST ALGORITHM
0032  3125 ;
0032  3126 ;       Subtest 1
0032  3127 ;
0032  3128 ;       This subtest examines the second level shifter inside ALP.
0032  3129 ;
0032  3130 ;        1. Initialize the CPU.
0032  3131 ;        2. Load the index K with a 1.
0032  3132 ;        3. Start signature analysis.
0032  3133 ;        4. Prepare a loop on I for 4 PLATCH values.
0032  3134 ;        5. Load the LITRL field of PL_[LITRL] with a PLATCH value.
0032  3135 ;        6. Load the PL_[LITRL] instruction into DCS.
0032  3136 ;        7. Prepare a loop on J for 6 test patterns.
0032  3137 ;        8. Generate a stuck at zero or one test pattern.
0032  3138 ;        9. Load the pattern into WDREG.
0032  3139 ;       10. Loop on error from here.
0032  3140 ;       11. Execute the micro-code to:
0032  3141 ;                1. Load the PLATCH with the LITRL field.
0032  3142 ;                2. Load MTEMP0 with the data in WDREG.
0032  3143 ;                3. Execute a ROT/RR.MM.P on MTEMP0 and put result into WHREG.
0032  3144 ;       12. Compare the data in WHREG with data from a table indexed by I.
0032  3145 ;       13. If the two do not match, signal an error.
0032  3146 ;       14. Increment the index K.
0032  3147 ;       15. Continue the loop for 6 test patterns.
0032  3148 ;       16. Continue the loop for 4 PLATCH values.
0032  3149 ;       17. Stop signature analysis.
0032  3150 ;
0032  3151 ;       Subtest 2
0032  3152 ;
0032  3153 ;       This subtest examines the first level shifter inside SRM.
0032  3154 ;
0032  3155 ;        1. Load the index K with a 1.
0032  3156 ;        2. Start signature analysis.
0032  3157 ;        3. Prepare a loop on I for 7 PLATCH values.
0032  3158 ;        4. Load the LITRL field of PL_[LITRL] with a PLATCH value.
0032  3159 ;        5. Load the PL_[LITRL] instruction into DCS.
0032  3160 ;        6. Prepare a loop on J for 6 test patterns.
0032  3161 ;        7. Generate a stuck at zero or one test pattern.
0032  3162 ;        8. Load the pattern into WDREG.
0032  3163 ;        9. Loop on error from here.
0032  3164 ;       10. Execute the micro-code to:
0032  3165 ;                1. Load the PLATCH with the LITRL field.
```

```
0032  3166 ;                    2. Load MTEMP0 with the data in WDREG.
0032  3167 ;                    3. Execute a ROT/RR.MM.P on MTEMP0 and put result into WHREG.
0032  3168 ;          11. Compare the data in WHREG with data from a table indexed by I.
0032  3169 ;          12. If the two do not match, signal an error.
0032  3170 ;          13. Increment the index K.
0032  3171 ;          14. Continue the loop for 6 test patterns.
0032  3172 ;          15. Continue the loop for 7 PLATCH values.
0032  3173 ;          16. Stop signature analysis.
0032  3174 ;
0032  3175 ; TEST DATA
0032  3176 ;
0032  3177 ;          The data patterns input to the rotator over the MBUS are the standard
0032  3178 ;          stuck at zero or one test pattterns used in most register tests.
0032  3179 ;          The expected data consists of the same data rotated right the proper
0032  3180 ;          number of bits. By using these data patterns it is possible to find any
0032  3181 ;          stuck bit in the rotator data path as well as any bit tied to any other
0032  3182 ;          bit, even after it has undergone a rotation.
0032  3183 ;
0032  3184 ;          Subtest 1
0032  3185 ;
0032  3186 ;          Index I = PLATCH test data being used.
0032  3187 ;          Index J = Stuck at zero or one test pattern being used.
0032  3188 ;          Index K = Index to expected data table.

0032  3268 ; LOGIC DESCRIPTION
0032  3269 ;
0032  3270 ;       The right rotation data path is in the SRM and ALP gate arrays on the
0032  3271 ;       DPM module. The right rotation function is decoded from the ROT field
0032  3272 ;       of the micro-word by the SRK and ALK gate arrays also on DPM.
0032  3273 ;       The decoded ROT field generates the control signals SHF1L, SHF0L, PRI1
0032  3274 ;       and PRI0 that control the SRM and ALP.
0032  3275 ;
```

```
                        3276 ; ASSUMPTIONS
                        3277 ;
                        3278 ;       This test assumes the scratchpad RTEMP0 is working as well as the MBUS
                        3279 ;       SBUS, WBUS and the rotator's PLATCH.
                        3280 ;
                        3281 ; ERROR DESCRIPTION
                        3282 ;
                        3283 ;       On error Subtest 1 will call out the ALP,SRM,SRK and ALK gate arrays.
                        3284 ;       On error Subtest 2 will call out the SRM and SRK gate arrays.
                        3285 ;
                        3286 ;       On error both subtests will type out the following information:
                        3287 ;
                        3288 ;       EXPECTED DATA

0032  3433 ;*******************************************************************************
0032  3434 ;++
0032  3435 ;
0032  3436 ; FUNCTIONAL DESCRIPTION
0032  3437 ;
0032  3438 ;       This test examines the rotator micro-orders RR.RR.PS and RR.RR.SIZ.
0032  3439 ;       The first micro-order rotates the data on the RBUS right by the number
0032  3440 ;       of bits specified from the sum of the contents of the PLATCH and the
0032  3441 ;       SLATCH. The second micro-order right rotates the data on the RBUS by
0032  3442 ;       the number of bits specified in the DTYPE field of the test micro-
0032  3443 ;       instruction.
0032  3444 ;
0032  3445 ; TEST ALGORITHM
0032  3446 ;
0032  3447 ;       This test is implemented in three subtests. The first subtest floats a
0032  3448 ;       zero through a field of ones in the PLATCH with a constant one loaded
0032  3449 ;       into the SLATCH. It then adds the two together and uses the sum to
0032  3450 ;       right rotate the data on the RBUS by that number of bits. The second
0032  3451 ;       subtest is identical to the first, except that the floating zero is
0032  3452 ;       run through the SLATCH with a constant one loaded into the PLATCH.
0032  3453 ;       The third subtest loads the DTYPE field of the test micro-instruction
0032  3454 ;       with the three data types BYTE, WORD and LONGWORD and then checks that
0032  3455 ;       the data on the RBUS is right rotated the correct number of bytes for
0032  3456 ;       each data type. The test algorithms for the subtests are given below:
0032  3457 ;
0032  3458 ;       Subtests 1 and 2
0032  3459 ;
0032  3460 ;        1. Initialize the CPU. (Subtest 1 only)
0032  3461 ;        2. Load a constant 1 into SLATCH (Subtest 1) or PLATCH (Subtest 2).
0032  3462 ;        3. Load the micro-instruction to test the P + S latch rotation.
0032  3463 ;        4. Load the index K with 1.
0032  3464 ;        5. Start signature analysis.
0032  3465 ;        6. Prepare to loop on I for 5 latch patterns.
0032  3466 ;        7. Load the RSRC field of the test micro-instruction to source TEMP0.
0032  3467 ;        8. Prepare a loop on J for 6 data patterns.
0032  3468 ;        9. Generate a test pattern based on J.
0032  3469 ;       10. Load the test pattern into the WDREG.
0032  3470 ;       11. Loop on error from here.
0032  3471 ;       12. Execute the micro-code to:
0032  3472 ;               1. Load PLATCH with a pattern (Subtest 1) or 1 (Subtest 2).
0032  3473 ;               2. Load the SLATCH with 1 (Subtest 1) or a pattern (Subtest 2).
0032  3474 ;               3. Load MTEMP0 with the test data from WDREG.
0032  3475 ;               4. Execute the test instruction and read the result to WHREG.
0032  3476 ;       13. Compare the WHREG contents with the expected data from a table
0032  3477 ;           indexed by K.
0032  3478 ;       14. If WHREG does not equal the expected data, signal an error.
0032  3479 ;       15. Increment the index K.
0032  3480 ;       16. Loop back to step 8 for rest of the data patterns.
0032  3481 ;       17. Loop back to step 6 for rest of latch patterns.
0032  3482 ;       18. End signature analysis.
0032  3483 ;
0032  3484 ;       Subtest 3
0032  3485 ;
0032  3486 ;        1. Load the index K with 1.
```

```
                        0032  3487 ;        2. Start signature analysis.
                        0032  3488 ;        3. Prepare to loop on I for 3 data types.
                        0032  3489 ;        4. Load a data type (either BYTE, WORD or LONG) into the DTYPE field
                        0032  3490 ;           of the test micro-instruction from the table at 5$ indexed by I.
                        0032  3491 ;        5. Load the test micro-instruction for Subtest 3 into DCS.
                        0032  3492 ;        6. Prepare a loop on J for 6 data patterns.
                        0032  3493 ;        7. Generate a standard stuck at zero or one test pattern based on J.
                        0032  3494 ;        8. Load the test pattern into the WDREG.
                        0032  3495 ;        9. Loop on error from here.
                        0032  3496 ;       10. Execute the micro-code to:
                        0032  3497 ;               1. Load MTEMP0 with the test pattern from WDREG.
                        0032  3498 ;               2. Rotate MTEMP0 right by DTYPE and write the result to WHREG.
                        0032  3499 ;       11. Compare the data in WHREG with the expected data from the table at
                        0032  3500 ;           6$ indexed by K.
                        0032  3501 ;       12. If WHREG does not equal the expected data, signal an error.
                        0032  3502 ;       13. Increment the index K.
                        0032  3503 ;       14. Continue the loop on J for the remaining data patterns.
                        0032  3504 ;       15. Continue the loop on I for the remaining data types.
                        0032  3505 ;
                        0032  3506 ; TEST DATA
                        0032  3507 ;
                        0032  3508 ;       The test data for Subtests 1 and 2 consist of a floating 0 pattern
                        0032  3509 ;       through a field of ones. This gives a good test of the SRK ALU by
                        0032  3510 ;       causing carries to ripple across bits <0:4> of the SLATCH and PLATCH.
                        0032  3511 ;       Bit <5> of the SLATCH and PLATCH is used for sign only and does not
                        0032  3512 ;       affect the number of bits shifted.
                        0032  3513 ;
                        0032  3514 ;       The data for Subtest 3 uses the 3 data types that can be loaded into
                        0032  3515 ;       the DTYPE field of the test micro-instruction; BYTE, WORD and LONG.
                        0032  3516 ;
                        0032  3517 ; LOGIC DESCRIPTION
                        0032  3518 ;
                        0032  3519 ;       The logic used to execute the right rotation of data on the RBUS is
                        0032  3520 ;       internal to the SRM and ALP gate arrays on the DPM module. The ALP
                        0032  3521 ;       gate array contains the second level shifter which can rotate data on
                        0032  3522 ;       the RBUS by 0,1,2 or 3 bits. The SRM contains the first level shifter
                        0032  3523 ;       which can rotate data on the RBUS from 0 to 7 bytes at a time. The
                        0032  3524 ;       SRK and ALK gate arrays are responsible for controlling the actions of
                        0032  3525 ;       this two level rotator.
                        0032  3526 ;

002F  3884 ; LOGIC DESCRIPTION
002F  3885 ;
002F  3886 ;       The left rotation data path is in the SRM and ALP gate arrays on the
```

```
                        002F  3887 ;       DPM module. The left rotation function is decoded from the ROT field
                        002F  3888 ;       of the micro-word by the SRK and ALK gate arrays also on DPM.
                        002F  3889 ;       The decoded ROT field generates the control signals SHF1L, SHF0L, PRI1
                        002F  3890 ;       and PRI0 that control the SRM and ALP.
                        002F  3891 ;
                        002F  3892 ; ASSUMPTIONS
                        002F  3893 ;
                        002F  3894 ;       This test assumes the scratchpad RTEMP0 is working as well as the RBUS
                        002F  3895 ;       SBUS, WBUS and the rotator's PLATCH.
                        002F  3896 ;
                        002F  3897 ; ERROR DESCRIPTION
                        002F  3898 ;
                        002F  3899 ;       On error Subtest 1 will call out the ALP,SRM,SRK and ALK gate arrays.
                        002F  3900 ;       On error Subtest 2 will call out the SRM and SRK gate arrays.
                        002F  3901 ;
                        002F  3902 ;       On error both subtests will type out the following information:
                        002F  3903 ;
                        002F  3904 ;       EXPECTED DATA

002F  4214 ;
```

```
                        002F  4215 ;       The left rotation data path is in the SRM and ALP gate arrays on the
                        002F  4216 ;       DPM module. The left rotation function is decoded from the ROT field
                        002F  4217 ;       of the micro-word by the SRK and ALK gate arrays also on DPM.
                        002F  4218 ;       The decoded ROT field generates the control signals SHF1L, SHF0L, PRI1
                        002F  4219 ;       and PRI0 that control the SRM and ALP.
                        002F  4220 ;
                        002F  4221 ; ASSUMPTIONS
                        002F  4222 ;
                        002F  4223 ;       This test assumes the scratchpad RTEMP0 is working as well as the RBUS
                        002F  4224 ;       SBUS, WBUS and the rotator's PLATCH.
                        002F  4225 ;
                        002F  4226 ; ERROR DESCRIPTION
                        002F  4227 ;
                        002F  4228 ;       On error Subtest 1 will call out the ALP,SRM,SRK and ALK gate arrays.
                        002F  4229 ;       On error Subtest 2 will call out the SRM and SRK gate arrays.
                        002F  4230 ;
                        002F  4231 ;       On error both subtests will type out the following information:

                        0044  4424 ;       This test examines the logic that performs a right rotation of the MBUS
                        0044  4425 ;       concatenated with the RBUS. The test loads specific data first into the
                        0044  4426 ;       PLATCH and then the SLATCH to rotate M'R (MBUS concatenated with RBUS)
                        0044  4427 ;       the number of bits necessary to check out the shift logic. This logic
                        0044  4428 ;       is inside the ALP and SRM gate arrays which in turn is controlled by
                        0044  4429 ;       logic inside the SRK and ALK chips.
                        0044  4430 ;
                        0044  4431 ; TEST ALGORITHM
                        0044  4432 ;
                        0044  4433 ;       This test is implemented in four subtests.
                        0044  4434 ;
                        0044  4435 ;       Subtests 1 and 3
                        0044  4436 ;
                        0044  4437 ;       These subtests examine the ROT/RR.MR.P and ROT/RR.MR.S micro-orders for
                        0044  4438 ;       PLATCH and SLATCH values of 0,1,2 and 3. This will check out the second
                        0044  4439 ;       level shifter inside the ALP gate array which receives data from the
                        0044  4440 ;       SRM chips and is controlled by signals from the ALK and SRK chips.
                        0044  4441 ;
                        0044  4442 ;       Subtests 2 and 4
                        0044  4443 ;
                        0044  4444 ;       These subtests examine the ROT/RR.MR.P and ROT/RR.MR.S micro-orders for
                        0044  4445 ;       PLATCH and SLATCH values of 4,8,12,16,20,24 and 28. This will check out
                        0044  4446 ;       the first level shifter inside the SRM gate array, controlled by SRK.
                        0044  4447 ;
                        0044  4448 ;       The test algorithm for each subtest is:
                        0044  4449 ;
                        0044  4450 ;        1. Initialize the CPU. (Subtest 1 only)
                        0044  4451 ;        2. Initialize the index K with a 1.
                        0044  4452 ;        2. Start signature analysis.
                        0044  4453 ;        3. Loop on I for the number of latch values to be tested.
                        0044  4454 ;        4. Load the LITRL field of a PL_[0] (Subtest 2) or SL_[0] (Subtest 3)
                        0044  4455 ;           micro-instruction with a value from a table indexed by I.
                        0044  4456 ;        5. Load the modified micro-instruction into DCS.
                        0044  4457 ;        6. Load DCS with the test micro-instruction to rotate right M'R by the
                        0044  4458 ;           number specified in the PLATCH for Subtests 1 and 2 (ROT/RR.MR.P)
                        0044  4459 ;           or to rotate right M'R by the number specified in the SLATCH for
                        0044  4460 ;           Subtests 3 and 4 (ROT/RR.MR.S). Both of these instructions have the
                        0044  4461 ;           MSRC and RSRC fields set up to source TEMP0.
                        0044  4462 ;        7. Loop on J for the 6 SA01 test patterns to be examined.
                        0044  4463 ;        8. Generate a stuck at zero or one test pattern.
                        0044  4464 ;        9. Load the generated test pattern into the WDREG.
                        0044  4465 ;       10. Loop on error from here.
                        0044  4466 ;       11. Execute the micro-code to:
                        0044  4467 ;               1. Load the PLATCH (Subtests 1 and 2) or SLATCH (Subtests 3 and
                        0044  4468 ;                  4) with the value generated by step 4.
                        0044  4469 ;               2. Load the scratchpad R[TEMP0] with the contents of WDREG.
                        0044  4470 ;               3. Execute the rotation ROT/RR.MR.P (Subtests 1 and 2) or
                        0044  4471 ;                  ROT/RR.MR.S (Subtests 3 and 4) writing the result to WHREG.
                        0044  4472 ;       12. Compare the contents of the WHREG against the expected data from
```

```
0044  4473 ;          a table indexed by K.
0044  4474 ;       13. If the expected data and WHREG do not agree call out an error.
0044  4475 ;       14. Increment the index K for the next expected data pattern.
0044  4476 ;       15. Loop back to step 7 for all 6 latch values.
0044  4477 ;       16. Loop on J for 1 more SA01 test pattern.
0044  4478 ;       17. Load the MSRC field with TEMP1 and the RSRC field with TEMP2 to
0044  4479 ;           source the last SA01 test pattern to the rotator.
0044  4480 ;       18. Loop on error from here.
0044  4481 ;       19. Execute the same micro-code as in step 11 with the different source
0044  4482 ;           values and write the resulting rotation into the WHREG.
0044  4483 ;       20. Compare the contents of the WHREG against the expected data from
0044  4484 ;           a table indexed by K.
0044  4485 ;       21. If the expected data and WHREG do not agree call out an error.
0044  4486 ;       22. Increment the index K for the next expected data pattern.
0044  4487 ;       23. End the loop started at step 16.
0044  4488 ;       24. Continue the loop on I for the other latch values.
0044  4489 ;       25. Stop signature analysis.
0044  4490 ;
0044  4491 ; TEST DATA
0044  4492 ;
0044  4493 ;       The data patterns input to the rotator over the RBUS are the standard
0044  4494 ;       stuck at zero or one test pattterns used in most register tests.
0044  4495 ;       The expected data consists of the same data rotated right the proper
0044  4496 ;       number of bits. By using these data patterns it is possible to find any
0044  4497 ;       stuck bit in the rotator data path as well as any bit tied to any other
0044  4498 ;       bit, even after it has undergone a rotation.
0044  4499 ;
0044  4500 ; LOGIC DESCRIPTION
0044  4501 ;
0044  4502 ;       The logic involved in this test includes the first and second level
0044  4503 ;       shifters which are internal to the SRM and ALP gate arrays. The right
0044  4504 ;       rotation function is decoded from the ROT field of the micro-word by
0044  4505 ;       the SRK and ALK gate arrays also on DPM. The decoded ROT field
0044  4506 ;       generates the control signals SHF1L, SHF0L, PRI1 and PRI0 that control
0044  4507 ;       the SRM and ALP.
0044  4508 ;
0044  4509 ; ASSUMPTIONS
0044  4510 ;
0044  4511 ;       This test assumes that the MBUS, RBUS, SBUS, WBUS, the scratchpads
0044  4512 ;       RTEMP0, MTEMP1 and RTEMP2, the Alu's WMUX_SBUS data path have all been
0044  4513 ;       tested prior to the execution of this test.
0044  4514 ;
0044  4515 ; ERROR DESCRIPTION
0044  4516 ;
0044  4517 ;       On error Subtests 1 and 3 will call out the ALP,SRM,SRK and ALK chips.
0044  4518 ;       On error Subtests 2 and 4 will call out the SRM and SRK chips.
0044  4519 ;
0044  4520 ;       All subtests will also type out the following data:
0044  4521 ;
0044  4522 ;       EXPECTED WBUS DATA
0044  4523 ;       RECEIVED WBUS DATA
0044  4524 ;       THE INDEX FOR THE PLATCH OR SLATCH DATA TABLE (INDEX I)
0044  4525 ;       THE INDEX FOR THE TEST PATTERN BEING USED (INDEX J)
0044  4526 ;       THE INDEX FOR THE EXPECTED DATA TABLE (INDEX K)
0044  4527 ;--

                        0044  4813 ;
                        0044  4814 ;       This test will examine the right rotation of the MBUS concatenated with
                        0044  4815 ;       the RBUS (M'R) using the SRK ALU to determine the number of bits to
                        0044  4816 ;       rotate by. This is accomplished using the rotator micro-order
                        0044  4817 ;       ROT/RR.MR.PS and rotating seven stuck at zero or one test patterns to
                        0044  4818 ;       test the rotation.
                        0044  4819 ;
                        0044  4820 ; TEST ALGORITHM
                        0044  4821 ;
                        0044  4822 ;       This test has been divided into two subtests. The first subtest exam-
                        0044  4823 ;       ines the SRK ALU by floating a zero through a field of ones in the
                        0044  4824 ;       SLATCH while keeping a constant one in the PLATCH. The second subtest
                        0044  4825 ;       examines the SRK ALU by floating a zero through a field of ones in the
                        0044  4826 ;       PLATCH while keeping a constant one in the SLATCH. Both subtests rotate
                        0044  4827 ;       a stuck at zero or one test pattern right by the number of bits
                        0044  4828 ;       specified by the sum of the SLATCH and PLATCH. The algorithm for both
                        0044  4829 ;       subtests is the same and is specified below:
                        0044  4830 ;
                        0044  4831 ;        1. Initialize the CPU. (Subtest 1 only)
                        0044  4832 ;        2. Load the LITRL field of a PL_[0] (Subtest 1) or SL_[0] (Subtest 2)
                        0044  4833 ;           micro-instruction with a constant 1.
                        0044  4834 ;        3. Load PL_[1] (Subtest 1) or SL_[1] (Subtest 2) instruction into DCS.
                        0044  4835 ;        4. Initialize the index K with a 1.
                        0044  4836 ;        5. Start signature analysis.
                        0044  4837 ;        6. Loop on I for a 5 bit floating zero pattern.
                        0044  4838 ;        7. Load the LITRL field of a SL_[0] (Subtest 1) or PL_[0] (Subtest 2)
                        0044  4839 ;           micro-instruction with a floating zero pattern from a table indexed
                        0044  4840 ;           by I and load it into DCS.
                        0044  4841 ;        8. Loop on J for 6 stuck at zero or one test patterns.
                        0044  4842 ;        9. Generate a stuck at zero or one test pattern based on index J.
                        0044  4843 ;       10. Load the WDREG with the generated test pattern.
                        0044  4844 ;       11. Loop on error from here.
                        0044  4845 ;       12. Execute the micro-code to:
                        0044  4846 ;               1. Load the PLATCH (Subtest 1) or SLATCH (Subtest 2) with a
                        0044  4847 ;                  constant 1.
                        0044  4848 ;               2. Load the SLATCH (Subtest 1) or PLATCH (Subtest 2) with a
                        0044  4849 ;                  floating zero test pattern.
                        0044  4850 ;               3. Load RTEMP0 with the contents of the WDREG.
                        0044  4851 ;               4. Execute a ROT/RR.MR.PS using RTEMP0 and MTEMP0 for the
                        0044  4852 ;                  source to rotate.
                        0044  4853 ;       13. Compare the contents of the WHREG with the expected data from a
                        0044  4854 ;           table indexed by K.
                        0044  4855 ;       14. If the WHREG is not the same as the expected data, signal an error.
                        0044  4856 ;       15. Increment the index K.
                        0044  4857 ;       16. Continue looping on J for the remaining test patterns.
                        0044  4858 ;       17. Prepare a single loop on J for the seventh test pattern.
                        0044  4859 ;       18. Load DCS with a micro-instruction to source the seventh pattern.
                        0044  4860 ;       19. Loop on error from here.
                        0044  4861 ;       20. Execute the micro-instructions to:
                        0044  4862 ;               1. Load the PLATCH (Subtest 1) or SLATCH (Subtest 2) with a
```

```
0044  4863 ;                    constant 1.
0044  4864 ;                 2. Load the SLATCH (Subtest 1) or PLATCH (Subtest 2) with a
0044  4865 ;                    floating zero test pattern.
0044  4866 ;                 3. Load RTEMP0 with the contents of the WDREG.
0044  4867 ;                 4. Execute a ROT/RR.MR.PS using R[TEMP2] and M[TEMP1] for the
0044  4868 ;                    source to rotate and write the result to WHREG.
0044  4869 ;           21. Compare the contents of the WHREG with the expected data from a
0044  4870 ;               table indexed by K.
0044  4871 ;           22. If the WHREG does not match the expected data, signal an error.
0044  4872 ;           23. Increment the index K.
0044  4873 ;           24. End the seventh loop on J.
0044  4874 ;           25. Continue looping on I until all 5 latch values have been tried.
0044  4875 ;           26. Stop signature analysis.
0044  4876 ;
0044  4877 ; TEST DATA
0044  4878 ;
0044  4879 ;           Upon execution of the ROT/RR.MR.PS micro-order, the SLATCH and the
0044  4880 ;           PLATCH are added and the resulting sum is used to right rotate the 64
0044  4881 ;           bits of MBUS concatenated with the RBUS. In Subtest 1, the SLATCH is
0044  4882 ;           loaded with the floating zero pattern, while the PLATCH is loaded with
0044  4883 ;           a constant one. For Subtest 2 the PLATCH is loaded with the floating
0044  4884 ;           zero pattern and the SLATCH is loaded with a constant one. Since there
0044  4885 ;           is no visibility into signals that control the rotator, seven stuck at
0044  4886 ;           zero or one test patterns are fed to the rotator and allowed to be
0044  4887 ;           right rotated by the sum of the S and P latches. The 32 bit result is
0044  4888 ;           checked against a longword that contains the correct result for that
0044  4889 ;           shift. The combination of the floating zero and stuck at zero or one
0044  4890 ;           test patterns are sufficient to test the ROT/RR.MR.PS micro-order.
0044  4891 ;
0044  4892 ; LOGIC DESCRIPTION
0044  4893 ;
0044  4894 ;           The logic involved in this test is contained in the SRM, SRK, and ALP
0044  4895 ;           gate arrays. SRK decodes the ROT field of the micro-word to generate
0044  4896 ;           the control signals, SHF<4:0>, PRI<1:0> and SEC<5:0> that control the
0044  4897 ;           rotation logic inside the SRM and ALP slices.
0044  4898 ;
0044  4899 ; ASSUMPTIONS
0044  4900 ;
0044  4901 ;           This test assumes the following logic has been tested and is working;
0044  4902 ;           the dual-port scratchpads TEMP0, TEMP1, and TEMP2; the MBUS, RBUS, SBUS
0044  4903 ;           WBUS, SLATCH, and PLATCH.
0044  4904 ;
0044  4905 ; ERROR DESCRIPTION
0044  4906 ;
0044  4907 ;           On error this test will call out the SRM, SRK, ALP, and ALK gate array
0044  4908 ;           and the following data:
0044  4909 ;
0044  4910 ;           EXPECTED WBUS DATA
0044  4911 ;           RECEIVED WBUS DATA
0044  4912 ;           INDEX I (SELECTS THE FLOATING ZERO PATTERN)
0044  4913 ;           INDEX J (SELECTS THE STUCK AT ZERO OR ONE TEST PATTERN)
0044  4914 ;           INDEX K (INDEX TO THE EXPECTED DATA TABLE)
0044  4915 ;

                        0044  5096 ;
                        0044  5097 ;       This test examines the rotator's ability to right rotate the MBUS con-
                        0044  5098 ;       catenated with the RBUS by four and nine bits by using the micro-orders
                        0044  5099 ;       ROT/RR.MR.4 and ROT/RR.MR.9.
                        0044  5100 ;
                        0044  5101 ; TEST ALGORITHM
                        0044  5102 ;
                        0044  5103 ;       This test is implemented in two subtests. The first subtest examines
                        0044  5104 ;       the ROT/RR.MR.4 micro-order, while the second subtest examines the
                        0044  5105 ;       ROT/RR.MR.9 micro-order. The algorithm used to implement both subtests
                        0044  5106 ;       is essentially the same and executes as follows:
                        0044  5107 ;
                        0044  5108 ;        1. Initialize the CPU. (Subtest 1 only)
                        0044  5109 ;        2. Load DCS with a micro-instruction that executes a ROT/RR.MR.4 (Sub-
                        0044  5110 ;           test 1) or a ROT/RR.MR.9 (Subtest 2) and sources the scratchpad
                        0044  5111 ;           TEMP0 onto both the MBUS and the RBUS.
                        0044  5112 ;        3. Start signature analysis.
                        0044  5113 ;        4. Loop on I for 6 stuck at zero or one test patterns.
                        0044  5114 ;        5. Generate a stuck at zero or one test pattern.
                        0044  5115 ;        6. Load the test pattern into the WDREG.
                        0044  5116 ;        7. Loop on error from here.
                        0044  5117 ;        8. Execute the micro-code to:
                        0044  5118 ;               1. Load RTEMP0 with the contents of the WDREG.
                        0044  5119 ;               2. Execute the rotation and write the result into WHREG.
                        0044  5120 ;        9. Compare the WHREG against the expected data, indexed by I.
                        0044  5121 ;       10. If the WHREG and the expected data do not match, signal an error.
                        0044  5122 ;       11. Continue the loop on I for the remaining test patterns.
                        0044  5123 ;       12. Load DCS with a micro-instruction that executes a ROT/RR.MR.4 (Sub-
                        0044  5124 ;           test 1) or a ROT/RR.MR.9 (Subtest 2) and sources the scratchpads
                        0044  5125 ;           MTEMP1 and RTEMP2 onto the MBUS and the RBUS.
                        0044  5126 ;       13. Setup a loop of one pass for the seventh stuck at zero or one test
                        0044  5127 ;           pattern with I = 7.
                        0044  5128 ;       14. Loop on error from here.
                        0044  5129 ;       15. Execute the micro-code to:
                        0044  5130 ;               1. Execute the rotation using MTEMP1 and RTEMP2 for the source
                        0044  5131 ;                  to rotate and write the result to WHREG.
                        0044  5132 ;       16. Compare the WHREG against the expected data, indexed by I.
                        0044  5133 ;       17. If the WHREG and the expected data do not match, signal an error.
                        0044  5134 ;       18. End the loop for the seventh test pattern.
                        0044  5135 ;       19. Stop signature analysis.
                        0044  5136 ;
                        0044  5137 ; TEST DATA
                        0044  5138 ;
                        0044  5139 ;       This test uses the stuck at zero or one test patterns required to test
                        0044  5140 ;       a quadword (64 bits). The expected data consists of these patterns
                        0044  5141 ;       rotated right by 4 bits for Subtest 1 and rotated right by 9 bits for
                        0044  5142 ;       Subtest 2. The two tables below list the values of MBUS, RBUS and WBUS
                        0044  5143 ;       for each iteration of the loop on I:
                        0044  5144 ;

0044  5169 ; LOGIC DESCRIPTION
0044  5170 ;
0044  5171 ;       The logic involved in the right rotation by 4 bits is internal to the
0044  5172 ;       SRM bit slices and the SRK gate arrays. The logic involved in the right
0044  5173 ;       rotation by 9 bits includes the ALP and SRM slices as well as the SRK
0044  5174 ;       gate array.
0044  5175 ;
0044  5176 ; ASSUMPTIONS
0044  5177 ;
0044  5178 ;       This test assumes the following logic has been tested and is working;
0044  5179 ;       the dual-port scratchpad registers TEMP0, TEMP1, and TEMP2; the MBUS,
0044  5180 ;       RBUS and WBUS; and the ALPCTL data path for WX_S.
0044  5181 ;
0044  5182 ; ERROR DESCRIPTION
0044  5183 ;
0044  5184 ;       Subtest 1 will call out the SRM and SRK gate arrays.
0044  5185 ;       Subtest 2 will call out the SRM, ALP, and SRK gate arrays.
0044  5186 ;
0044  5187 ;       The following data will also be typed out:
0044  5188 ;
0044  5189 ;       EXPECTED WBUS DATA
0044  5190 ;       RECEIVED WBUS DATA
0044  5191 ;       LOOP COUNTER I
0044  5192 ;

                        0043  5326 ;++
                        0043  5327 ;
                        0043  5328 ; FUNCTIONAL DESCRIPTION
                        0043  5329 ;
                        0043  5330 ;       This test examines the rotator's ability to left rotate data from the
                        0043  5331 ;       MBUS concatenated with the RBUS.
                        0043  5332 ;
                        0043  5333 ; TEST ALGORITHM
                        0043  5334 ;
                        0043  5335 ;       This test is implemented in two subtests. The first subtest examines
                        0043  5336 ;       the second level shifter inside the ALP gate arrays by executing rotat-
                        0043  5337 ;       ions of 0,1,2 and 3 bits. The second subtest examines the first level
                        0043  5338 ;       shifter inside the SRM gate array by executing rotations of 4,8,12,16,
                        0043  5339 ;       20,24 and 28 bits. The test algorithm for both is as follows:
                        0043  5340 ;
                        0043  5341 ;        1. Initialize the CPU. (Subtest 1 only)
                        0043  5342 ;        2. Initialize the index K with a 1.
                        0043  5343 ;        3. Start signature analysis.
                        0043  5344 ;        4. Loop on I for 4 (Subtest 1) or for 7 (Subtest 2) PLATCH values.
                        0043  5345 ;        5. Load the LITRL field of a PLATCH_[0] instruction with a PLATCH
                        0043  5346 ;           value from a table indexed by I.
                        0043  5347 ;        6. Load the PLATCH_[LITRL] instruction into DCS.
                        0043  5348 ;        7. Load the ROT/RL.RM.P test instruction with the source fields set
                        0043  5349 ;           to source MTEMP0 and RTEMP0.
                        0043  5350 ;        8. Loop on J for 6 stuck at zero or one test patterns.
                        0043  5351 ;        9. Generate a stuck at zero or one test pattern based on J.
                        0043  5352 ;       10. Load the WDREG with the test pattern.
                        0043  5353 ;       11. Loop on error from here.
                        0043  5354 ;       12. Execute the micro-code to:
                        0043  5355 ;               1. Load the PLATCH with the contents of the LITRL field.
                        0043  5356 ;               2. Load RTEMP0 with the contents of the WDREG.
                        0043  5357 ;               3. Execute a left rotation of the RBUS concatenated with the
                        0043  5358 ;                  MBUS using as a source RTEMP0 and MTEMP0. Write the result
                        0043  5359 ;                  to the WHREG.
                        0043  5360 ;       13. Does the contents of the WHREG match the expected data read from a
                        0043  5361 ;           table indexed by K?
                        0043  5362 ;       14. If not, signal an error.
                        0043  5363 ;       15. Increment the index K.
                        0043  5364 ;       16. Continue the loop on J.
                        0043  5365 ;       17. Loop once on J having a value of 7.
                        0043  5366 ;       18. Modify the test instruction in DCS to source MTEMP1 and RTEMP2.
                        0043  5367 ;       19. Loop on error from here.
                        0043  5368 ;       20. Execute the micro-code to:
                        0043  5369 ;               1. Load the PLATCH with the contents of the LITRL field.
                        0043  5370 ;               2. Load RTEMP0 with the contents of the WDREG.
                        0043  5371 ;               3. Execute a left rotation of the RBUS concatenated with the
                        0043  5372 ;                  MBUS using as a source RTEMP2 and MTEMP1. Write the result
                        0043  5373 ;                  to the WHREG.
                        0043  5374 ;       21. Does the contents of the WHREG match the expected data read from a
                        0043  5375 ;           table indexed by K?
                        0043  5376 ;       22. If not, signal an error.
                        0043  5377 ;       23. Increment the index K.
                        0043  5378 ;       24. End the loop on J equal to 7.
```

```
                     0043  5379 ;       25. Continue the loop on I.
                     0043  5380 ;       26. Stop signature analysis.
                     0043  5381 ;       27. Skip to next test. (Subtest 2)
                     0043  5382 ;
                     0043  5383 ; TEST DATA
                     0043  5384 ;
                     0043  5385 ;       77 data patterns are used to test the rotation. Each pattern is a stuck
                     0043  5386 ;       at zero or one test pattern rotated left the number of bits indicated
                     0043  5387 ;       by the contents of the PLATCH. There are 11 PLATCH values, 4 for
                     0043  5388 ;       Subtest 1 and 7 for Subtest 2. The PLATCH values were chosen to test
                     0043  5389 ;       the first and second level shifters inside the SRM and ALP slices.
                     0043  5390 ;

0043        .SBTTL  "TEST   053     Rotator Test 33 Left Rotation of RBUS concat. with MBUS Test
0043  5605 ;*******************************************************************************
0043  5606 ;++
0043  5607 ;
0043  5608 ; FUNCTIONAL DESCRIPTION
0043  5609 ;
0043  5610 ;       This test examines the two rotator micro-orders that rotate the RBUS
0043  5611 ;       concatenated with the MBUS left by four bits and by the sum of the
0043  5612 ;       contents of the SLATCH and PLATCH. (ROT/RL.RM.4 and ROT/RL.RM.PS)
0043  5613 ;
0043  5614 ; TEST ALGORITHM
0043  5615 ;
0043  5616 ;       This test is implemented in three subtests. Subtest 1 examines the left
0043  5617 ;       rotation of RBUS and MBUS by four bits. Subtest 2 uses a floating zero
0043  5618 ;       pattern in the SLATCH and a constant one in the PLATCH to test the left
0043  5619 ;       rotation of RBUS and MBUS by the sum of the two latches. Subtest 3 uses
0043  5620 ;       a floating zero pattern in the PLATCH and a constant one in the SLATCH
0043  5621 ;       to test the left rotation of RBUS and MBUS by the sum of the latches.
0043  5622 ;       The algorithm for Subtest 1 and Subtests 2 and 3 are as follows:
0043  5623 ;
0043  5624 ;       Subtest 1
0043  5625 ;
0043  5626 ;        1. Initialize the CPU.
0043  5627 ;        2. Load DCS with the micro-instruction ROT/RL.RM.4 using the contents
0043  5628 ;           of scratchpad TEMP0 to drive both busses.
0043  5629 ;        3. Start signature analysis.
0043  5630 ;        4. Loop on I for 6 stuck at zero or one test patterns.
0043  5631 ;        5. Generate a stuck at zero or one test pattern based on I.
0043  5632 ;        6. Load the test pattern into WDREG.
0043  5633 ;        7. Loop on error from here.
0043  5634 ;        8. Execute the micro-code to:
0043  5635 ;               1. Load the PLATCH with the contents of the LITRL field.
0043  5636 ;               2. Load the SLATCH with the contents of the LITRL field.
0043  5637 ;               3. Load RTEMP0 with the contents of WDREG.
0043  5638 ;               4. Execute the ROT/RL.RM.4 and write the result to WHREG.
0043  5639 ;        9. Does the WHREG match the expected data from a table indexed by I?
0043  5640 ;       10. If not, signal an error.
0043  5641 ;       11. Continue the loop on I for the remaining test patterns.
0043  5642 ;       12. Loop once on I equal to 7.
0043  5643 ;       13. Load DCS with the micro-instruction ROT/RL.RM.4 using the contents
0043  5644 ;           of scratchpads MTEMP1 and RTEMP2 to drive the two busses.
0043  5645 ;       14. Loop on error from here.
0043  5646 ;       15. Run the micro-code for the rotation and write the result to WHREG.
0043  5647 ;       16. Does the WHREG match the expected data from a table indexed by I?
0043  5648 ;       17. If not, signal an error.
0043  5649 ;       18. End the single loop on I equal to seven.
0043  5650 ;       19. Stop signature analysis.
0043  5651 ;
0043  5652 ;       Subtests 2 and 3
0043  5653 ;
0043  5654 ;        1. Load the LITRL field of a PLATCH gets LITRL (Subtest 2) or SLATCH
0043  5655 ;           gets LITRL (Subtest 3) micro-instruction with a constant 1.
0043  5656 ;        2. Load the instruction into DCS.
0043  5657 ;        3. Initialize the index K with a 1.
0043  5658 ;        4. Start signature analysis.
```

```
0043  5659 ;        5. Loop on I for 5 SLATCH (Subtest 2) or PLATCH (Subtest 3) values.
0043  5660 ;        6. Load the LITRL field of a SLATCH gets LITRL (Subtest 2) or PLATCH
0043  5661 ;           gets LITRL (Subtest 3) micro-instruction with a floating zero from
0043  5662 ;           a table indexed by I.
0043  5663 ;        7. Load the instruction into DCS.
0043  5664 ;        8. Load a ROT/RL.RM.PS test instruction with the source fields set to
0043  5665 ;           source MTEMP0 and RTEMP0.
0043  5666 ;        9. Loop on J for 6 stuck at zero or one test patterns.
0043  5667 ;       10. Generate a stuck at zero or one test pattern based on J.
0043  5668 ;       11. Load the WDREG with the test pattern.
0043  5669 ;       12. Loop on error from here.
0043  5670 ;       13. Execute the micro-code to:
0043  5671 ;                1. Load the PLATCH with the contents of the LITRL field.
0043  5672 ;                2. Load the SLATCH with the contents of the LIRTL field.
0043  5673 ;                3. Load RTEMP0 with the contents of the WDREG.
0043  5674 ;                4. Using the contents of TEMP0 to drive both busses, execute a
0043  5675 ;                   left rotation of the RBUS and MBUS by the sum of SLATCH and
0043  5676 ;                   PLATCH. Write the result to the WHREG.
0043  5677 ;       14. Does the WHREG match the expected data from a table indexed by K?
0043  5678 ;       15. If not, signal an error.
0043  5679 ;       16. Increment the index K for the next test pattern.
0043  5680 ;       17. Continue the loop on J for the remaining test patterns.
0043  5681 ;       18. Loop once on J equal to 7.
0043  5682 ;       19. With the source fields set to source MTEMP2 and RTEMP1, load a
0043  5683 ;           ROT/RL.RM.PS test instruction into DCS.
0043  5684 ;       20. Loop on error from here.
0043  5685 ;       21. Run the rotation and write the result into the WHREG.
0043  5686 ;       22. Does the WHREG match the expected data from a table indexed by K?
0043  5687 ;       23. If not, signal an error.
0043  5688 ;       24. Increment the index K for the next test pattern.
0043  5689 ;       25. End the loop on J equal to 7.
0043  5690 ;       26. Continue the loop on I for the remaining SLATCH (Subtest 2) or
0043  5691 ;           PLATCH (Subtest 3) values.
0043  5692 ;       27. Stop signature analysis.
0043  5693 ;       28. End of this test, skip to the next test. (Subtest 3 only)
0043  5694 ;
0043  5695 ; TEST DATA
0043  5696 ;
0043  5697 ;       Because RBUS concatenated with MBUS is 64 bits wide, seven stuck at
0043  5698 ;       zero or one test patterns must be used to check the rotation logic.
0043  5699 ;       The first six patterns contain the same data for both busses and can be
0043  5700 ;       placed into a single longword using the SA01PAT psuedo-op. The seventh
0043  5701 ;       pattern places all zeros on the MBUS and all ones on the RBUS. These
0043  5702 ;       two longwords are stored into the scratchpads MTEMP1 and RTEMP2, which
0043  5703 ;       are driven onto the MBUS and RBUS at the appropriate time. The number
0043  5704 ;       of bit positions each test pattern is rotated by depends on the subtest
0043  5705 ;       under execution. The subtest dependent data is as follows:
0043  5706 ;
0043  5707 ;       Subtest 1
0043  5708 ;
0043  5709 ;       The expected data for this subtest consists of the seven stuck at zero
0043  5710 ;       or one test patterns rotated left by four bits.
0043  5711 ;
0043  5712 ;       Subtests 2 and 3
0043  5713 ;
```

```
                        0043  5714 ;       The expected data for these two subtests consists of the seven stuck at
                        0043  5715 ;       zero or one test patterns rotated left by 31, 30, 28, 24 and 16 bits.
                        0043  5716 ;       These numbers are obtained when a one is added to a 5 bit floating zero
                        0043  5717 ;       pattern. The floating zero patterns are used to check the logic that
                        0043  5718 ;       adds the SLATCH and PLATCH.
                        0043  5719 ;
                        0043  5720 ; LOGIC DESCRIPTION
                        0043  5721 ;
                        0043  5722 ;       The logic involved in this test is contained in the SRM, SRK, and ALP
                        0043  5723 ;       gate arrays. SRK decodes the ROT field of the micro-word to generate
                        0043  5724 ;       the control signals, SHF<4:0>, PRI<1:0>, and SEC<5:0> that control the
                        0043  5725 ;       rotation logic inside the SRM and ALP slices.
                        0043  5726 ;
                        0043  5727 ; ASSUMPTIONS
                        0043  5728 ;
                        0043  5729 ;       This test assumes the following logic has been tested and is working;
                        0043  5730 ;       the MBUS, RBUS, SBUS and WBUS; the dual port scratchpads TEMP0, TEMP1
                        0043  5731 ;       and TEMP2; the PLATCH and SLATCH; and the WMUX_S.Q_0 ALPCTL data path.
                        0043  5732 ;
                        0043  5733 ; ERROR DESCRIPTION
                        0043  5734 ;
                        0043  5735 ;       For Subtest 1 these gate arrays are called out: SRK,SRM.
                        0043  5736 ;       For Subtests 2 and 3 these gate arrays are called out: SRK,SRM,ALP.
                        0043  5737 ;
                        0043  5738 ;       On error Subtest 1 types out the following data:
                        0043  5739 ;
                        0043  5740 ;       EXPECTED WBUS DATA
                        0043  5741 ;       RECEIVED WBUS DATA

003D        .SBTTL  "TEST   054     Rotator Test 34 Zero Extend and Rotate Left Literal Test
003D  5988 ;*******************************************************************************
003D  5989 ;++
003D  5990 ;
003D  5991 ; FUNCTIONAL DESCRIPTION
003D  5992 ;
003D  5993 ;       This test examines the rotator's ability to zero extend a nine bit
003D  5994 ;       literal and rotate it left by a specific number of bits.
003D  5995 ;
003D  5996 ; TEST ALGORITHM
003D  5997 ;
003D  5998 ;        1. Initialize the CPU.
003D  5999 ;        2. Load the index K with a 1.
003D  6000 ;        3. Start signature analysis.
003D  6001 ;        4. Loop on I for 7 ROT/ZLIT micro-orders.
003D  6002 ;        5. Load the ROT field of the test micro-instruction with the proper
003D  6003 ;           ZLIT micro-order as read from a table indexed by I.
003D  6004 ;        6. Loop on J for 5 stuck at zero or one test patterns.
003D  6005 ;        7. Generate a stuck at zero or one test pattern based on J.
003D  6006 ;        8. Load the LITRL field of the test micro-instr. with the pattern.
003D  6007 ;        9. Load the modified test micro-instruction into DCS.
003D  6008 ;       10. Loop on error from here.
003D  6009 ;       11. Execute the micro-code to:
003D  6010 ;               1. Zero extend and left rotate the test pattern in the LITRL
003D  6011 ;                  field by the number of bits specified by the ZLIT micro-
003D  6012 ;                  order in the ROT field. Write the result to WHREG.
003D  6013 ;       12. Does the WHREG match the expected data from a table indexed by K?
003D  6014 ;       13. If not, signal an error.
003D  6015 ;       14. Increment the index K for the next test pattern.
003D  6016 ;       15. Continue the loop on J for the remaining test patterns.
003D  6017 ;       16. Continue the loop on I for the remaining ROT field micro-orders.
003D  6018 ;       17. Stop signature analysis.
003D  6019 ;       18. End of this test, skip to the next test.
003D  6020 ;
003D  6021 ; TEST DATA
003D  6022 ;
003D  6023 ;       The expected data for this test consists of the five stuck at zero or
003D  6024 ;       one test patterns zero extended and left rotated the proper number of
003D  6025 ;       bits for each of the seven ZLIT micro-orders tested.
003D  6026 ;
003D  6027 ; LOGIC DESCRIPTION
003D  6028 ;
003D  6029 ;       The logic used to perform the zero extension and left rotation of the
003D  6030 ;       LITRL field is internal to the SRM slices. The SRK gate array decodes
003D  6031 ;       the ROT field of the micro-word to generate the control signals,
003D  6032 ;       SHF<4:0>, PRI<1:0>, and SEC<5:0> that control the SRM slices.
003D  6033 ;
003D  6034 ; ASSUMPTIONS
003D  6035 ;
003D  6036 ;       This test assumes the following logic has been tested and is working;
003D  6037 ;       the SBUS and WBUS and the WMUX_S.Q_0 ALPCTL data path.
003D  6038 ;
003D  6039 ; ERROR DESCRIPTION
003D  6040 ;
003D  6041 ;       On error this test will call out the SRM and SRK gate arrays.
```

```
                        003D  6042 ;

003C        .SBTTL  "TEST   055     Rotator Test 35 One Extend and Rotate Left Literal Test
003C  6135 ;*******************************************************************************
003C  6136 ;++
003C  6137 ;
003C  6138 ; FUNCTIONAL DESCRIPTION
003C  6139 ;
003C  6140 ;       This test examines the rotator's ability to one extend a nine bit
003C  6141 ;       literal and rotate it left by a specific number of bits.
003C  6142 ;
003C  6143 ; TEST ALGORITHM
003C  6144 ;
003C  6145 ;        1. Initialize the CPU.
003C  6146 ;        2. Load the index K with a 1.
003C  6147 ;        3. Start signature analysis.
003C  6148 ;        4. Loop on I for 3 ROT/OLIT micro-orders.
003C  6149 ;        5. Load the ROT field of the test micro-instruction with the proper
003C  6150 ;           OLIT micro-order as read from a table indexed by I.
003C  6151 ;        6. Loop on J for 5 stuck at zero or one test patterns.
003C  6152 ;        7. Generate a stuck at zero or one test pattern based on J.
003C  6153 ;        8. Load the LITRL field of the test micro-instr. with the pattern.
003C  6154 ;        9. Load the modified test micro-instruction into DCS.
003C  6155 ;       10. Loop on error from here.
003C  6156 ;       11. Execute the micro-code to:
003C  6157 ;               1. Zero extend and left rotate the test pattern in the LITRL
003C  6158 ;                  field by the number of bits specified by the OLIT micro-
003C  6159 ;                  order in the ROT field. Write the result to WHREG.
003C  6160 ;       12. Does the WHREG match the expected data from a table indexed by K?
003C  6161 ;       13. If not, signal an error.
003C  6162 ;       14. Increment the index K for the next test pattern.
003C  6163 ;       15. Continue the loop on J for the remaining test patterns.
003C  6164 ;       16. Continue the loop on I for the remaining ROT field micro-orders.
003C  6165 ;       17. Stop signature analysis.
003C  6166 ;       18. End of this test, skip to the next test.
003C  6167 ;
003C  6168 ; TEST DATA
003C  6169 ;
003C  6170 ;       The expected data for this test consists of the five stuck at zero or
003C  6171 ;       one test patterns one extended and left rotated the proper number of
003C  6172 ;       bits for each of the three OLIT micro-orders tested.
003C  6173 ;
003C  6174 ; LOGIC DESCRIPTION
003C  6175 ;
003C  6176 ;       The logic used to perform the one extension and left rotation of the
003C  6177 ;       LITRL field is internal to the SRM slices. The SRK gate array decodes
003C  6178 ;       the ROT field of the micro-word to generate the control signals,
003C  6179 ;       SHF<4:0>, PRI<1:0>, and SEC<5:0> that control the SRM slices.
003C  6180 ;
003C  6181 ; ASSUMPTIONS
003C  6182 ;
003C  6183 ;       This test assumes the following logic has been tested and is working;
003C  6184 ;       the SBUS and WBUS and the WMUX_S.Q_0 ALPCTL data path.
003C  6185 ;
003C  6186 ; ERROR DESCRIPTION
003C  6187 ;
003C  6188 ;       On error this test will call out the SRM and SRK gate arrays.
```

0042          .SBTTL  "TEST   056     Rotator Test 36 Arithmetic Right Shift of MBUS by PLATCH Tes
0042  6270 ;*******************************************************************************
0042  6271 ;++
0042  6272 ;
0042  6273 ; FUNCTIONAL DESCRIPTION
0042  6274 ;
0042  6275 ;       This test examines the rotator's ability to perform an arithmetic right
0042  6276 ;       shift of the MBUS by the number of bits specified in the PLATCH.
0042  6277 ;
0042  6278 ; TEST ALGORITHM
0042  6279 ;
0042  6280 ;       This test is implemented in four subtests. Subtest 1 makes sure that no
0042  6281 ;       shifts occur when zero is loaded into the PLATCH and the input data
0042  6282 ;       consists of a longword with only bit 31 set. Subtest 2 uses the arith-
0042  6283 ;       metic right shift function to generate rightward marching one patterns
0042  6284 ;       by using the contents of the loop counter I to load the PLATCH and the
0042  6285 ;       input data used in Subtest 1. Subtest 3 makes sure that no shifts occur
0042  6286 ;       when zero is loaded into the PLATCH and the input data consists of a
0042  6287 ;       longword with only bit 31 clear. Subtest 4 uses the arithmetic right
0042  6288 ;       shift function to generate rightward marching zero patterns by using
0042  6289 ;       the contents of the loop counter I to load the PLATCH and the input
0042  6290 ;       data used in Subtest 3. The test algorithms for Subtests 1 and 3 and
0042  6291 ;       Subtests 2 and 4 are specified below:
0042  6292 ;
0042  6293 ;       Subtests 1 and 3
0042  6294 ;
0042  6295 ;        1. Initialize the CPU. (Subtest 1 only)
0042  6296 ;        2. Start signature analysis. (Subtest 1 only)
0042  6297 ;        3. Load the WDREG with a longword equal to 8000000 (Subtest 1) or
0042  6298 ;           7FFFFFF (Subtest 2).
0042  6299 ;        4. Zero the LITRL field of a PLATCH gets LITRL micro-instruction.
0042  6300 ;        5. Load the micro-instruction into DCS.
0042  6301 ;        6. Loop on error from here.
0042  6302 ;        7. Execute the micro-code to:
0042  6303 ;               1. Load the PLATCH with zero.
0042  6304 ;               2. Load MTEMP0 with the contents of WDREG.
0042  6305 ;               3. Shift MBUS right by PLATCH and write the result to WHREG.
0042  6306 ;        8. Compare the contents of WHREG with the expected data.
0042  6307 ;        9. If the two do not match, signal an error.
0042  6308 ;
0042  6309 ;       Subtests 2 and 4
0042  6310 ;
0042  6311 ;        1. Loop on I for 31 shifts.
0042  6312 ;        2. Save the contents of I.
0042  6313 ;        3. Load the LITRL field of a PLATCH gets LITRL microword with I.
0042  6314 ;        4. Load the microword into DCS.
0042  6315 ;        5. Loop on error from here.
0042  6316 ;        6. Execute the shift and write the result to WHREG.
0042  6317 ;        7. Compare the contents of WHREG with the expected data.
0042  6318 ;        8. If the two do not match, signal an error.
0042  6319 ;        9. Continue the loop on I until all shifts have been tried.
0042  6320 ;       10. Stop signature analysis. (Subtest 4 only)
0042  6321 ;       11. End of this test, skip to next test. (Subtest 4 only)
0042  6322 ;
0042  6323 ; TEST DATA
```

```
                        6324 ;
                        6325 ;       This test uses marching zero and one patterns to test the shifter.
                        6326 ;
                        6327 ; LOGIC DESCRIPTION
                        6328 ;
                        6329 ;       The right shift function is implemented by the ALP and SRM gate arrays
                        6330 ;       which obtain their control signals from ALK and SRK.
                        6331 ;
                        6332 ; ASSUMPTIONS
                        6333 ;
                        6334 ;       This test assumes the following logic has been tested and is working;
                        6335 ;       the scratchpads TEMP0, TEMP1 and TEMP2; the RBUS, MBUS, WBUS and SBUS;
                        6336 ;       the PLATCH and the ALPCTL data path WX_S.Q_0.
                        6337 ;
                        6338 ; ERROR DESCRIPTION
                        6339 ;
                        6340 ;       On error any Subtest will call out the ALP, ALK, SRM and SRK chips.
                        6341 ;
                        6342 ;       The following data will be typed for Subtests 1 and 3:
                        6343 ;
                        6344 ;       EXPECTED WBUS DATA

0043  6497 ;*******************************************************************************
0043  6498 ;++
0043  6499 ;
0043  6500 ; FUNCTIONAL DESCRIPTION
0043  6501 ;
0043  6502 ;       This test examines the arithmetic right shift of MBUS data by the
0043  6503 ;       number of bits specified by the twos complement of the PLATCH.
0043  6504 ;
0043  6505 ; TEST ALGORITHM
0043  6506 ;
0043  6507 ;       This test is implemented in two subtests. The first subtest floats a
0043  6508 ;       one through the PLATCH, by looping six times on the index I.
0043  6509 ;       The algorithm for both subtests is as follows:
0043  6510 ;
0043  6511 ;        1. Initialize the CPU. (Subtest 1 only)
0043  6512 ;        2. Start signature analysis.
0043  6513 ;        3. Loop on I for 6 floating one (Subtest 1) or floating zero
0043  6514 ;           (Subtest 2) patterns.
0043  6515 ;        4. Load a floating one or zero into the LITRL field of a PL_[] inst.
0043  6516 ;        5. Load the instruction into DCS.
0043  6517 ;        6. Loop on error from here.
0043  6518 ;        7. Execute the micro-code to:
0043  6519 ;                1. Load the PLATCH with the floating pattern.
0043  6520 ;                2. Execute the rotation and write the result to WHREG.
0043  6521 ;                3. Read the PLATCH into MTEMP1.
0043  6522 ;        8. Compare the WHREG with the expected WBUS results.
0043  6523 ;        9. If the two do not match, signal an error.
0043  6524 ;       10. Continue the loop on I for the remaining test patterns.
0043  6525 ;       11. End signature analysis.
0043  6526 ;       12. End of the test. (Subtest 2 only)
0043  6527 ;
0043  6528 ; TEST DATA
0043  6529 ;
0043  6530 ;       The following data is used to implement this test:
0043  6531 ;
0043  6532 ;            Index I       PLATCH value        WBUS Data
0043  6533 ;
0043  6534 ;               01              00              80000000
0043  6535 ;               02              01              FFFFFFFF
0043  6536 ;               03              02              FFFFFFFE
0043  6537 ;               04              04              FFFFFFF8
0043  6538 ;               05              08              FFFFFF80
0043  6539 ;               06              10              FFFF8000
0043  6540 ;
0043  6541 ; LOGIC DESCRIPTION
0043  6542 ;
0043  6543 ;       This test examines the two's complementer inside the SRK gate array as
0043  6544 ;       well as the shifter inside the ALP slices.
0043  6545 ;
0043  6546 ; ASSUMPTIONS
0043  6547 ;
0043  6548 ;       This test assumes the following logic has been tested and is working;
0043  6549 ;       the scratchpads TEMP0, TEMP1 and TEMP2; the RBUS, MBUS, SBUS and WBUS;
0043  6550 ;       the PLATCH; and the ALPCTL WX_S.Q_0 data path.
```

                        003F  7008 ;
                        003F  7009 ;       This test examines the arithmetic left shift of the RBUS by the number
                        003F  7010 ;       of bits specified by the DTYPE field of the micro-instruction.
                        003F  7011 ;
                        003F  7012 ; TEST ALGORITHM
                        003F  7013 ;
                        003F  7014 ;       This test is implemented by shifting six stuck at zero or one test
                        003F  7015 ;       patterns by the three data types available from the DTYPE field.
                        003F  7016 ;       The algorithm is as follows:
                        003F  7017 ;
                        003F  7018 ;        1. Initialize the CPU.
                        003F  7019 ;        2. Start signature analysis.
                        003F  7020 ;        3. Initialize the index K with a 1.
                        003F  7021 ;        4. Loop on I for 3 data types. (Byte, Word and Long)
                        003F  7022 ;        5. Load the DTYPE field of the test micro-instruction with a data
                        003F  7023 ;           type from a table indexed by I.
                        003F  7024 ;        6. Load the test micro-instruction into DCS.
                        003F  7025 ;        7. Loop on J for 6 stuck at zero or one test patterns.
                        003F  7026 ;        8. Generate a stuck at zero or one pattern based on J.
                        003F  7027 ;        9. Load the test pattern into the WDREG.
                        003F  7028 ;       10. Loop on error from here.
                        003F  7029 ;       11. Execute the micro-code to:
                        003F  7030 ;               1. Load RTEMP0 with the WDREG.
                        003F  7031 ;               2. Shift RTEMP0 left by the number of bits specified by DTYPE
                        003F  7032 ;                  (using ROT/ASL.R.SIZ), strobe the VBUS to latch in DSIZE and
                        003F  7033 ;                  write the result to WHREG.
                        003F  7034 ;       12. Compare the WHREG with the expected data from a table indexed by K.
                        003F  7035 ;       13. If the two do not match, signal an error.
                        003F  7036 ;       14. Increment the index K for the next test pattern.
                        003F  7037 ;       15. Continue the loop on J for the remaining stuck at patterns.
                        003F  7038 ;       16. Continue the loop on I for the remaining DTYPES.
                        003F  7039 ;       17. Stop signature analysis.
                        003F  7040 ;       18. End of test, skip to the next test.
                        003F  7041 ;
                        003F  7042 ; TEST DATA
                        003F  7043 ;
                        003F  7044 ;       Three bytes are used to load the DTYPE field. Their values are 0, 1 and
                        003F  7045 ;       2 which correspond to the data types Byte, Word and Long.
                        003F  7046 ;       The table below gives the I,J,K, DTYPE, RBUS and WBUS values:

003C                    .SBTTL  "TEST   05C     Rotator Test 42 Arithmetic Left Shift of RBUS by 7 Test
003C  7171 ;*****************************************************************************
003C  7172 ;++
003C  7173 ;
003C  7174 ; FUNCTIONAL DESCRIPTION
003C  7175 ;
003C  7176 ;       This test examines an arithmetic left shift of the RBUS by 7 bits.
003C  7177 ;
003C  7178 ; TEST ALGORITHM
003C  7179 ;
003C  7180 ;       This test is implemented by the following algorithm:
003C  7181 ;
003C  7182 ;        1. Initialize the CPU.
003C  7183 ;        2. Start signature analysis.
003C  7184 ;        3. Loop on I for 6 stuck at zero or one test patterns.
003C  7185 ;        4. Generate a stuck at zero or one test pattern based on I.
003C  7186 ;        5. Load the test pattern into the WDREG.
003C  7187 ;        6. Loop on error from here.
003C  7188 ;        7. Execute the micro-code to:
003C  7189 ;               1. Load RTEMP0 with the WDREG.
003C  7190 ;               2. Shift (ROT/ASL.R.7) and write the result to WHREG.
003C  7191 ;        8. Compare WHREG with the expected data from a table indexed by I.
003C  7192 ;        9. If the two do not match, signal an error.
003C  7193 ;       10. Continue the loop on I for the remaining stuck at patterns.
003C  7194 ;       11. Stop signature analysis.
003C  7195 ;       12. End of test, skip to the next test.
003C  7196 ;
003C  7197 ; TEST DATA
003C  7198 ;
003C  7199 ;       This test uses 6 stuck at zero or one patterns shifted left by 7 bits.
003C  7200 ;
003C  7201 ; LOGIC DESCRIPTION
003C  7202 ;
003C  7203 ;       The arithmetic left shift of RBUS by 7 bits is decoded inside the SRK
003C  7204 ;       gate array.
003C  7205 ;
003C  7206 ; ASSUMPTIONS
003C  7207 ;
003C  7208 ;       This test assumes the following logic has been tested and is working;
003C  7209 ;       the scratchpad RTEMP0; the RBUS, SBUS and WBUS; and the ALPCTL data
003C  7210 ;       path WX_S.Q_0.
003C  7211 ;
003C  7212 ; ERROR DESCRIPTION
003C  7213 ;
003C  7214 ;       On error this test will call out the SRK gate array and will type out
003C  7215 ;       the following data:
003C  7216 ;
003C  7217 ;       EXPECTED WBUS DATA
003C  7218 ;       RECEIVED WBUS DATA
003C  7219 ;       TEST PATTERN LOOP COUNT (INDEX I)
003C  7220 ;       INPUT SHIFT DATA (RTEMP0)

0038          .SBTTL  "TEST   05D     Rotator Test 43 Unpack Floating Point Fraction Test
0038  7277 ;*******************************************************************************
0038  7278 ;++
0038  7279 ;
0038  7280 ; FUNCTIONAL DESCRIPTION
0038  7281 ;
0038  7282 ;       This test examines the rotator's ability to unpack the fraction field
0038  7283 ;       of a floating point datum. The output data is generated by performing
0038  7284 ;       an extract and merge operation on data input from the MBUS concatenated
0038  7285 ;       with the RBUS.
0038  7286 ;
0038  7287 ; TEST ALGORITHM
0038  7288 ;
0038  7289 ;       This test is implemented by running seven stuck at zero or one test
0038  7290 ;       patterns through the 64 bits of the MBUS concatenated with the RBUS.
0038  7291 ;       The test algorithm executes as follows:
0038  7292 ;
0038  7293 ;        1. Initialize the CPU.
0038  7294 ;        2. Start signature analysis.
0038  7295 ;        3. Load the micro-code for the first six test patterns.
0038  7296 ;        4. Loop on I for 6 stuck at zero or one test patterns.
0038  7297 ;        5. Generate a stuck a zero or one test pattern for a longword.
0038  7298 ;        6. Load the pattern into the WDREG.
0038  7299 ;        7. Loop on error from here.
0038  7300 ;        8. Execute the micro-code to:
0038  7301 ;                1. Load the test pattern from WDREG to MTEMP0.
0038  7302 ;                2. Load the test pattern from WDREG to RTEMP1.
0038  7303 ;                3. Placing RTEMP1 on the RBUS and MTEMP0 on the MBUS, execute
0038  7304 ;                   the unpack function and route the result on the SBUS through
0038  7305 ;                   the ALP's WMUX to the RDM's WHREG.
0038  7306 ;        9. Compare the contents of the WHREG against a table of expected data.
0038  7307 ;       10. If the two do not match, signal an error.
0038  7308 ;       11. Continue the loop started at step 4 for the remaining patterns.
0038  7309 ;       12. Load the micro-code for the seventh test pattern.
0038  7310 ;       13. Loop once on I = 7 for the last stuck at zero or one test pattern.
0038  7311 ;       14. Loop on error from here.
0038  7312 ;       15. Execute the micro-code to:
0038  7313 ;                4. Load the LONLIT register with all ones.
0038  7314 ;                5. Load MTEMP0 with zero.
0038  7315 ;                6. Load MTEMP1 (and RTEMP1) with the LONLIT register.
0038  7316 ;                7. Placing RTEMP1 on the RBUS and MTEMP0 on the MBUS, execute
0038  7317 ;                   the unpack function and route the result on the SBUS through
0038  7318 ;                   the ALP's WMUX to the RDM's WHREG.
0038  7319 ;       16. Compare the contents of the WHREG against a table of expected data.
0038  7320 ;       17. If the two do not match, signal an error.
0038  7321 ;       18. End the loop started at step 13.
0038  7322 ;       19. Stop signature analysis.
0038  7323 ;       20. End of this test, skip to the next test.
0038  7324 ;
0038  7325 ; TEST DATA
0038  7326 ;
0038  7327 ;       Seven stuck at zero or one test patterns are used to test the unpack
0038  7328 ;       function. The unpack extracts and merges fields from the MBUS con-
0038  7329 ;       catenated with the RBUS and places the result on the SBUS as follows:
0038  7330 ;
```

```
0038  7331 ;                SBUS <06:00> <-- RBUS <31:25>
0038  7332 ;                SBUS <22:07> <-- MBUS <31:16>
0038  7333 ;                SBUS <29:23> <-- MBUS <06:00>
0038  7334 ;                SBUS <31:30> <-- 01
0038  7335 ;
0038  7336 ;       The input and output data patterns used are:
0038  7337 ;
0038  7338 ;                     Input Data      Expected Output Data
0038  7339 ;
0038  7340 ;                  MBUS     RBUS          SBUS
0038  7341 ;                 AAAAAAAA AAAAAAAA       55555555

0038  7348 ;
0038  7349 ; LOGIC DESCRIPTION
0038  7350 ;
0038  7351 ;       The unpack function is performed inside the SRM gate arrays. The SRM's
0038  7352 ;       are controlled by the SRK gate array via the control signals PRI<1:0>
0038  7353 ;       and SEC<5:0>.
0038  7354 ;
0038  7355 ; ASSUMPTIONS
0038  7356 ;
0038  7357 ;       This test assumes the following logic on the DPM has been tested and
0038  7358 ;       is working; the MBUS, RBUS, SBUS and WBUS; the scratchpads RTEMP1 and
0038  7359 ;       MTEMP0; and the ALPCTL data path for WX_S.Q_0.
0038  7360 ;
0038  7361 ; ERROR DESCRIPTION
0038  7362 ;
0038  7363 ;       On error this test will call out the SRM and SRK gate arrays. The
0038  7364 ;       following data will also by typed:
0038  7365 ;
0038  7366 ;       EXPECTED SBUS DATA
0038  7367 ;       RECEIVED SBUS DATA
0038  7368 ;       LOOP COUNT I
0038  7369 ;       MBUS DATA
0038  7370 ;       RBUS DATA

0034          .SBTTL  "TEST   05E     Rotator Test 44 Pack Floating Point Number Test
0034  7468 ;*******************************************************************************
0034  7469 ;++
0034  7470 ;
0034  7471 ; FUNCTIONAL DESCRIPTION
0034  7472 ;
0034  7473 ;       This test examines the rotator logic used to pack the exponent and
0034  7474 ;       fraction field of a floating point datum. The output data is generated
0034  7475 ;       by performing an extract and merge operation on data input from the
0034  7476 ;       MBUS concatenated with the RBUS.
0034  7477 ;
0034  7478 ; TEST ALGORITHM
0034  7479 ;
0034  7480 ;       This test is implemented by running seven stuck at zero or one test
0034  7481 ;       patterns through the 64 bits of the MBUS concatenated with the RBUS.
0034  7482 ;       The test algorithm executes as follows:
0034  7483 ;
0034  7484 ;        1. Initialize the CPU.
0034  7485 ;        2. Start signature analysis.
0034  7486 ;        3. Load the micro-code for the first six test patterns.
0034  7487 ;        4. Loop on I for 6 stuck at zero or one test patterns.
0034  7488 ;        5. Generate a stuck a zero or one test pattern for a longword.
0034  7489 ;        6. Load the pattern into the WDREG.
0034  7490 ;        7. Loop on error from here.
0034  7491 ;        8. Execute the micro-code to:
0034  7492 ;                1. Load the test pattern from WDREG to MTEMP0.
0034  7493 ;                2. Load the test pattern from WDREG to RTEMP1.
0034  7494 ;                3. Placing RTEMP1 on the RBUS and MTEMP0 on the MBUS, execute
0034  7495 ;                   the pack function and route the result on the SBUS through
0034  7496 ;                   the ALP's WMUX to the RDM's WHREG.
0034  7497 ;        9. Compare the contents of the WHREG against a table of expected data.
0034  7498 ;       10. If the two do not match, signal an error.
0034  7499 ;       11. Continue the loop started at step 4 for the remaining patterns.
0034  7500 ;       12. Load the micro-code for the seventh test pattern.
0034  7501 ;       13. Loop once on I = 7 for the last stuck at zero or one test pattern.
0034  7502 ;       14. Loop on error from here.
0034  7503 ;       15. Execute the micro-code to:
0034  7504 ;                4. Load the LONLIT register with all ones.
0034  7505 ;                5. Load MTEMP0 with zero.
0034  7506 ;                6. Load MTEMP1 (and RTEMP1) with the LONLIT register.
0034  7507 ;                7. Placing RTEMP1 on the RBUS and MTEMP0 on the MBUS, execute
0034  7508 ;                   the pack function and route the result on the SBUS through
0034  7509 ;                   the ALP's WMUX to the RDM's WHREG.
0034  7510 ;       16. Compare the contents of the WHREG against a table of expected data.
0034  7511 ;       17. If the two do not match, signal an error.
0034  7512 ;       18. End the loop started at step 13.
0034  7513 ;       19. Stop signature analysis.
0034  7514 ;       20. End of this test, skip to the next test.
0034  7515 ;
0034  7516 ; TEST DATA
0034  7517 ;
0034  7518 ;       Seven stuck at zero or one test patterns are used to test the pack
0034  7519 ;       function. The pack extracts and merges fields from the MBUS con-
0034  7520 ;       catenated with the RBUS and places the result on the SBUS as follows:
0034  7521 ;
```

```
0034  7522 ;                SBUS <06:00> <-- MBUS <31:25>
0034  7523 ;                SBUS <14:07> <-- RBUS <07:00>
0034  7524 ;                SBUS <31:16> <-- MBUS <24:09>
0034  7525 ;                SBUS <15>    <-- 0
0034  7526 ;
0034  7527 ;       The input and output data patterns used are:
0034  7528 ;
0034  7529 ;                     Input Data      Expected Output Data
0034  7530 ;
0034  7531 ;                   MBUS     RBUS          SBUS
0034  7532 ;                  AAAAAAAA AAAAAAAA       55555555

0034  7539 ;
0034  7540 ; LOGIC DESCRIPTION
0034  7541 ;
0034  7542 ;       The pack function is performed inside the SRM gate arrays. The SRM's
0034  7543 ;       are controlled by the SRK gate array via the control signals PRI<1:0>
0034  7544 ;       and SEC<5:0>.
0034  7545 ;
0034  7546 ; ASSUMPTIONS
0034  7547 ;
0034  7548 ;       This test assumes the following logic on the DPM has been tested and
0034  7549 ;       is working; the MBUS, RBUS, SBUS and WBUS; the scratchpads RTEMP1 and
0034  7550 ;       MTEMP0; and the ALPCTL data path for WX_S.Q_0.
0034  7551 ;
0034  7552 ; ERROR DESCRIPTION
0034  7553 ;
0034  7554 ;       On error this test will call out the SRM and SRK gate arrays. The
0034  7555 ;       following data will also by typed:
0034  7556 ;
0034  7557 ;       EXPECTED SBUS DATA
0034  7558 ;       RECEIVED SBUS DATA
0034  7559 ;       LOOP COUNT I
0034  7560 ;       MBUS DATA
0034  7561 ;       RBUS DATA

0030          .SBTTL  "TEST   05F     Rotator Test 45 Floating Point Literal Test
0030  7659 ;*******************************************************************************
0030  7660 ;++
0030  7661 ;
0030  7662 ; FUNCTIONAL DESCRIPTION
0030  7663 ;
0030  7664 ;       This test will examine the rotator's ability to exapnd a floating
0030  7665 ;       point literal on the MBUS.
0030  7666 ;
0030  7667 ; TEST ALGORITHM
0030  7668 ;
0030  7669 ;       This test is implemented using six longword stuck at zero or one test
0030  7670 ;       patterns. The patterns are written onto the MBUS and expanded through
0030  7671 ;       the rotator using the FPLIT function to the SBUS. The contents of the
0030  7672 ;       SBUS are then routed through the ALP's to the WBUS via the ALPCTL's
0030  7673 ;       WX_S.Q_0 micro-order where it can be sampled by the RDM's WHREG.
0030  7674 ;       The test executes as follows:
0030  7675 ;
0030  7676 ;        1. Initialize the CPU.
0030  7677 ;        2. Start signature analysis.
0030  7678 ;        3. Loop on I for 6 longword stuck at zero or one test patterns.
0030  7679 ;        4. Generate a longword stuck at zero or one test pattern based on I.
0030  7680 ;        5. Load the pattern into the WDREG.
0030  7681 ;        6. Loop on error from here.
0030  7682 ;        7. Execute the micro-code to:
0030  7683 ;                1. Load the WDREG into MTEMP0.
0030  7684 ;                2. Source MTEMP0 onto the MBUS and zero onto the RBUS and
0030  7685 ;                   execute the floating literal operation, writing the result
0030  7686 ;                   to the RDM's WHREG.
0030  7687 ;        8. Compare the WHREG against a table of expected data indexed by I.
0030  7688 ;        9. If the comparison shows that the two do not match, signal an error.
0030  7689 ;       10. Continue the loop started in step 3 for the remaining patterns.
0030  7690 ;       11. Stop signature analysis.
0030  7691 ;       12. End of the test, skip to the next test.
0030  7692 ;
0030  7693 ; TEST DATA
0030  7694 ;
0030  7695 ;       Six longword stuck at zero or one test patterns are input to the
0030  7696 ;       rotator from the MBUS with the RBUS held to zero. The floating point
0030  7697 ;       literal function extracts eight bits from the MBUS and places them onto
0030  7698 ;       the SBUS as follows:
0030  7699 ;
0030  7700 ;               SBUS <03:00> <-- 0
0030  7701 ;               SBUS <11:04> <-- MBUS<07:00>
0030  7702 ;               SBUS <13:12> <-- 0
0030  7703 ;               SBUS <14>    <-- 1
0030  7704 ;               SBUS <31:15> <-- 0
0030  7705 ;
0030  7706 ;       The input and output data patterns are:
0030  7707 ;
0030  7708 ;                 MBUS            SBUS
0030  7709 ;               AAAAAAAA        00004AA0
0030  7710 ;               55555555        00004550
0030  7711 ;               33333333        00004330
0030  7712 ;               0F0F0F0F        000040F0
```

```
                     0030  7713 ;                    00FF00FF        00004FF0
                     0030  7714 ;                    0000FFFF        00004FF0
                     0030  7715 ;
                     0030  7716 ; LOGIC DESCRIPTION
                     0030  7717 ;
                     0030  7718 ;       The floating literal extract is performed inside the SRM gate arrays.
                     0030  7719 ;       The SRM's are controlled by the SRK gate array via the control signals
                     0030  7720 ;       PRI<1:0> and SEC<5:0>.
                     0030  7721 ;
                     0030  7722 ; ASSUMPTIONS
                     0030  7723 ;
                     0030  7724 ;       This test assumes the following logic on the DPM has been tested and
                     0030  7725 ;       is working; the MBUS, RBUS, SBUS and WBUS; the scratchpad MTEMP0;
                     0030  7726 ;       and the ALPCTL data path for WX_S.Q_0.
                     0030  7727 ;
                     0030  7728 ; ERROR DESCRIPTION
                     0030  7729 ;
                     0030  7730 ;       On error this test will call out the SRM and SRK gate arrays. The
                     0030  7731 ;       following data will also by typed:
                     0030  7732 ;
                     0030  7733 ;       EXPECTED SBUS DATA
                     0030  7734 ;       RECEIVED SBUS DATA

0033        .SBTTL  "TEST   060     Rotator Test 46 Find Most Significant Bit Test
0033  7795 ;*******************************************************************************
0033  7796 ;++
0033  7797 ;
0033  7798 ; FUNCTIONAL DESCRIPTION
0033  7799 ;
0033  7800 ;       This test examines the rotator logic used to find the most significant
0033  7801 ;       bit set in a longword.
0033  7802 ;
0033  7803 ; TEST ALGORITHM
0033  7804 ;
0033  7805 ;       This test is implemented by floating a one across 32 bits, each time
0033  7806 ;       expecting the correct bit position for the one to be written into the
0033  7807 ;       PLATCH. The test algorithm executes as follows:
0033  7808 ;
0033  7809 ;        1. Initialize the CPU.
0033  7810 ;        2. Start signature analysis.
0033  7811 ;        3. Loop on I for 32 floating one patterns.
0033  7812 ;        4. Load the WDREG with a pattern from a table indexed by I.
0033  7813 ;        5. Loop on error from here.
0033  7814 ;        6. Execute the micro-code to:
0033  7815 ;                1. Write WDREG into MTEMP0 and RTEMP0.
0033  7816 ;                2. Source RTEMP0 onto the RBUS, MTEMP0 onto the MBUS, route
0033  7817 ;                   the RBUS onto the WBUS using the ALPCTL micro-order WX_R.Q_D
0033  7818 ;                   and execute the find most significant bit function.
0033  7819 ;                3. Write the contents of the PLATCH into WHREG.
0033  7820 ;        7. Compare WHREG against a table of expected data indexed by I.
0033  7821 ;        8. If the two do not match, signal an error.
0033  7822 ;        9. Continue the loop from step 3 until all patterns have been tried.
0033  7823 ;       10. Stop signature analysis.
0033  7824 ;       11. End of the test, skip to the next test.
0033  7825 ;
0033  7826 ; TEST DATA
0033  7827 ;
0033  7828 ;       This test uses 32 longword floating one patterns for input data and
0033  7829 ;       32 bytes of decimal data for expected output data.
0033  7830 ;       The data is as follows:
0033  7831 ;
0033  7832 ;          MBUS RBUS WBUS Data       Expected PLATCH contents
0033  7833 ;               00000001 (hex)                 00 (decimal)

0030        .SBTTL  "TEST   062     Rotator Test 48 Convert Numeric to BCD Test
0030  8088 ;*******************************************************************************
0030  8089 ;++
0030  8090 ;
0030  8091 ; FUNCTIONAL DESCRIPTION
0030  8092 ;
0030  8093 ;       This test examines the rotator's ability to covert eight numeric digits
0030  8094 ;       on the MBUS concatenated with the RBUS to eight BCD digits.
0030  8095 ;
0030  8096 ; TEST ALGORITHM
0030  8097 ;
0030  8098 ;       This test is implemented using seven 64 bit stuck at zero or one test
0030  8099 ;       patterns. These patterns are input to the rotator from the MBUS
0030  8100 ;       concatenated with the RBUS. They are then extracted and shuffled by
0030  8101 ;       the convert function before being placed on the SBUS. From the SBUS
0030  8102 ;       they are passed through the ALP's to the WBUS and the RDM's WHREG.
0030  8103 ;       The test algorithm executes as follows:
0030  8104 ;
0030  8105 ;        1. Initialize the CPU.
0030  8106 ;        2. Start signature analysis.
0030  8107 ;        3. Load the micro-code for the first six test patterns.
0030  8108 ;        4. Loop on I for 6 stuck at zero or one test patterns.
0030  8109 ;        5. Generate a stuck a zero or one test pattern for a longword.
0030  8110 ;        6. Load the pattern into the WDREG.
0030  8111 ;        7. Loop on error from here.
0030  8112 ;        8. Execute the micro-code to:
0030  8113 ;                1. Load the test pattern from WDREG to MTEMP0.
0030  8114 ;                2. Load the test pattern from WDREG to RTEMP1.
0030  8115 ;                3. Placing RTEMP1 on the RBUS and MTEMP0 on the MBUS, execute
0030  8116 ;                   the convert function and route the result on the SBUS
0030  8117 ;                   through the ALP's WMUX to the RDM's WHREG.
0030  8118 ;        9. Compare the contents of the WHREG against a table of expected data.
0030  8119 ;       10. If the two do not match, signal an error.
0030  8120 ;       11. Continue the loop started at step 4 for the remaining patterns.
0030  8121 ;       12. Load the micro-code for the seventh test pattern.
0030  8122 ;       13. Loop once on I = 7 for the last stuck at zero or one test pattern.
0030  8123 ;       14. Loop on error from here.
0030  8124 ;       15. Execute the micro-code to:
0030  8125 ;                4. Load the LONLIT register with all ones.
0030  8126 ;                5. Load MTEMP0 with zero.
0030  8127 ;                6. Load MTEMP1 (and RTEMP1) with the LONLIT register.
0030  8128 ;                7. Placing RTEMP1 on the RBUS and MTEMP0 on the MBUS, execute
0030  8129 ;                   the convert function and route the result on the SBUS
0030  8130 ;                   through the ALP's WMUX to the RDM's WHREG.
0030  8131 ;       16. Compare the contents of the WHREG against a table of expected data.
0030  8132 ;       17. If the two do not match, signal an error.
0030  8133 ;       18. End the loop started at step 13.
0030  8134 ;       19. Stop signature analysis.
0030  8135 ;       20. End of this test, skip to the next test.
0030  8136 ;
0030  8137 ; TEST DATA
0030  8138 ;
0030  8139 ;       Seven stuck at zero or one test patterns are used to test the numeric
0030  8140 ;       to BCD conversion. The conversion extracts and merges fields from the
0030  8141 ;       MBUS concatenated with the RBUS and places the result on the SBUS as
```

```
0030  8142 ;       follows:
0030  8143 ;
0030  8144 ;               SBUS <03:00> <-- MBUS <11:08>
0030  8145 ;               SBUS <07:04> <-- MBUS <03:00>
0030  8146 ;               SBUS <11:08> <-- MBUS <27:24>
0030  8147 ;               SBUS <15:12> <-- MBUS <19:16>
0030  8148 ;               SBUS <19:16> <-- RBUS <11:08>
0030  8149 ;               SBUS <23:20> <-- RBUS <03:00>
0030  8150 ;               SBUS <27:24> <-- RBUS <27:24>
0030  8151 ;               SBUS <31:28> <-- RBUS <19:16>
0030  8152 ;
0030  8153 ;       The input and output data patterns used are:
0030  8154 ;
0030  8155 ;                   Input Data      Expected Output Data
0030  8156 ;

0030  8165 ;
0030  8166 ; LOGIC DESCRIPTION
0030  8167 ;
0030  8168 ;       The numeric to BCD conversion is performed inside the SRM gate arrays.
0030  8169 ;       The SRM's are controlled by the SRK gate array via the control signals
0030  8170 ;       PRI<1:0> and SEC<5:0>.
0030  8171 ;
0030  8172 ; ASSUMPTIONS
0030  8173 ;
0030  8174 ;       This test assumes the following logic on the DPM has been tested and
0030  8175 ;       is working; the MBUS, RBUS, SBUS and WBUS; the scratchpads RTEMP1 and
0030  8176 ;       MTEMP0; and the ALPCTL data path for WX_S.Q_0.
0030  8177 ;
0030  8178 ; ERROR DESCRIPTION
0030  8179 ;
0030  8180 ;       On error this test will call out the SRM and SRK gate arrays. The
0030  8181 ;       following data will also by typed:
0030  8182 ;
0030  8183 ;       EXPECTED SBUS DATA
0030  8184 ;       RECEIVED SBUS DATA
0030  8185 ;       LOOP COUNT I
0030  8186 ;       MBUS DATA
0030  8187 ;       RBUS DATA
0030  8188 ;--
0030  8189 ;*******************************************************************************

Performance indicators

Phase	Page faults	CPU Time	Elapsed Time
Initialization	34	00:00:00.15	00:00:02.13
Command processing	856	00:00:00.92	00:00:02.61
Pass 1	5403	00:02:59.59	00:04:10.11
Symbol table sort	0	00:00:00.66	00:00:00.66
Pass 2	539	00:00:47.16	00:01:11.61
Symbol table output	2	00:00:00.25	00:00:01.29

Psect synopsis output	2	00:00:00.88	00:00:00.92
Cross-reference output	0	00:00:00.00	00:00:00.00
Assembler run totals	6837	00:03:49.62	00:05:29.33

The working set limit was 8000 pages.
2335716 bytes (4562 pages) of virtual memory were used to buffer the intermediate code.
There were 30 pages of symbol table space allocated to hold 371 non-local and 243 local symbols.
9027 source lines were read in Pass 1, producing 555 object records in Pass 2.
97 pages of virtual memory were used to define 43 macros.

Macro library statistics

Macro library name	Macros defined
DISK$UCODPACK00:[VAX750]COMETMAC.MLB;805	43
SYS$COMMON:[SYSLIB]STARLET.MLB;2	0
TOTALS (all libraries)	43

1901 GETS were required to define 43 macros.

There were 0 errors, 1 warning and 0 information messages, on lines:
 4807 (1)

MACRO UCOD$0:[VAX750.DPM]TITLE+DISK$UCODPACK00:[VAX750]COMETASM+UCOD$0:[VAX750.DPM]ECKAB2/LIS=ECKAB2/OBJ=ECKAB2

0000     27 ;
0000     28 ; REVISION HISTORY
0000     29 ;
0000     30 ; 00-01 Tom Groetzinger 4-FEB-1980
0000     31 ;       Started file.
0000     32 ;
0000     33 ; 00-02 Dave Spain      27-FEB-1980
0000     34 ;       Added CS BUS INTEGRITY test.
0000     35 ;
0000     36 ; 00-03 Tom Groetzinger 12-MAR-1980
0000     37 ;       Added five tests.
0000     38 ;
0000     39 ; 00-04 Tom Groetzinger 17-MAR-1980
0000     40 ;       Added SRK,SRM callouts to some tests.
0000     41 ;
0000     42 ; 00-05 Tom Groetzinger 17-MAR-1980
0000     43 ;       Improved tests 7 and 16 to increase coverage due to Westboro feedback
0000     44 ;
0000     45 ; 00-06 Tom Groetzinger 17-MAR-1980
0000     46 ;       Debugged test 16 dueu to major rewrite
0000     47 ;
0000     48 ; 00-07 Tom Groetzinger 17-MAR-1980
0000     49 ;       Added 9 Super Rotator tests
0000     50 ;
0000     51 ; 01-08 Dave Spain       4-APR-80
0000     52 ;       Added 4 Micro-sequencer tests for offical release.
0000     53 ;
0000     54 ; 01-09 Bill Landry     4-APR-1980
0000     55 ;       Added the XB, PREFETCH and IRD tests from ECKAC.SRC so
0000     56 ;       manufacturing can run one tape for DPM.
0000     57 ;
0000     58 ; 00-10 Bill Landry     4-APR-1980
0000     59 ;       Let's save version 1.0 for our first SDC release.
0000     60 ;
0000     61 ; 00-11 Tom Groetzinger 7-APR-1980
0000     62 ;       Added 2 ALK Tests
0000     63 ;
0000     64 ; 00-12 Tom Groetzinger 8-APR-1980
0000     65 ;       Deleted last 2 D Register outputs from ALK Test #6
0000     66 ;
0000     67 ; 00-13 Tom Groetzinger 14-APR-1980
0000     68 ;       Added D Register output to ALK test #6
0000     69 ;
0000     70 ; 00-14 Dave Spain      25-APR-1980
0000     71 ;       Changed mask on the micro-sequencer tests to ignore bit 13 of the
0000     72 ;       Control Store address.
0000     73 ;
0000     74 ; 00-15 Dave Spain      28-APR-1980
0000     75 ;       Fixed bug in ALK Tests 6 and 7 by replacing VSIZE/1 micro order with a
0000     76 ;       SIZE[LONG] macro in micro words 6 and 3 respectively.
0000     77 ;
0000     78 ; 00-16 Dave Spain      29-APR-1980
```

```
0000     79 ;       Changed mask on CS address for Instruction Address Decode test from
0000     80 ;       3FFF to 1FFF to ignore bit 13 of Control Store address.
0000     81 ;
0000     82 ; 00-17 Dave Spain      30-APR-1980
0000     83 ;       Added CCS module to error callout for Control Store Bus Integrity test.
0000     84 ;
0000     85 ; 00-18 Dave Spain       9-MAY-1980
0000     86 ;       Added SRM gate array to error callout routine in RTMP0 and RTEMP
0000     87 ;       Sratchpad tests.
0000     88 ;
0000     89 ; 00-19 Bill Landry     10-JUN-1980
0000     90 ;       Added RDM tests to beginning of tape
0000     91 ;
0000     92 ; 01-00 Bill Landry/Dave Spain  13-JUN-1980
0000     93 ;       Added macro file to title section and compatibility mode IRD tests
0000     94 ;       then submitted to RELEASE ENGINERRING.
0000     95 ;
0000     96 ; 01-01 Dave Spain      19-JUN-1980
0000     97 ;       Fixed prefetch incrementer test to clear out cache data after every
0000     98 ;       prefetch. This will prevent the test from mistaking bad addresses from
0000     99 ;       good ones.
0000    100 ;
0000    101 ; 01-02 Dave Spain       2-JUL-1980
0000    102 ;       Added CM Second IRDX tests to file.
0000    103 ;
0000    104 ; 01-03 Dave Spain      18-AUG-1980
0000    105 ;       Added CM branch test to file.
0000    106 ;
0000    107 ; 01-04 Dave Spain      10-SEPT-1980
0000    108 ;       Fixed "DEFAULT MTEMP0 TEST"
0000    109 ;
0000    110 ; 01-05 Bill Landry     11-SEPT-1980
0000    111 ;       Revised RDM to CMI tests
0000    112 ;
0000    113 ; 02-00 Dave Spain      28-SEPT-1980
0000    114 ;       Added rotator tests to file and submitted to SDC.
0000    115 ;
0000    116 ; 02-01 Dave Spain      28-OCT-1980
0000    117 ;       Added QV flag to tests to be run by manufacturing.
0000    118 ;
0000    119 ; 02-02 Bill Landry     10-NOV-1980
0000    120 ;       Added tests for TOK and SAC gate arrays.
0000    121 ;
0000    122 ; 02-03 Bill Landry     13-NOV-1980
0000    123 ;       Added test of REI CHECK
0000    124 ;
0000    125 ; 03-00 Dave Spain      17-NOV-1980
0000    126 ;       Added rotator tests 23-28 and released to SDC.
0000    127 ;
0000    128 ; 03-01 Dave Spain      10-DEC-1980
0000    129 ;       Added rotator tests 29-42.
0000    130 ;
0000    131 ; 03-02 Bill Landry     11-DEC-1980
0000    132 ;       Fixed bug in CS ADDRESS test
0000    133 ;
```

```
0000    134 ; 03-03 Dave Spain      12-DEC-1980
0000    135 ;       Enhanced Rotator Test 1 to call out ALP slices.
0000    136 ;
0000    137 ; 03-04 Bill Landry     16-DEC-1980
0000    138 ;       Added DSIZE ROM tests
0000    139 ;
0000    140 ; 03-05 Bill Landry     31-DEC-1980
0000    141 ;       Last great act of 80. Separated DPM and RDM tests into two files.
0000    142 ;
0000    143 ; 04-00 Bill Landry     5-JAN-1981
0000    144 ;       Submitted to RELEASE ENGINERRING
0000    145 ;
0000    146 ; 04-01 Bill Landry     14-JAN-1981
0000    147 ;       Revised INTERVAL TIMER INTERRUPT TEST to fix bug caused by INT PEND
0000    148 ;       ECO
0000    149 ;
0000    150 ; 04-02 Dave Spain      16-JAN-1981
0000    151 ;       Fixed error callout in CS Parity Error, XB, and Prefetch Incrementer
0000    152 ;       tests and added seven new rotator tests.
0000    153 ;
0000    154 ; 04-03 Bill Landry     4-FEB-1981
0000    155 ;       Added tests for CCC gate array
0000    156 ;
0000    157 ; 04-04 Dave Spain      9-FEB-1981
0000    158 ;       Changed the names of rotator tests 23-33.
0000    159 ;
0000    160 ; 04-05 Bill Landry     24-FEB-1981
0000    161 ;       Added tests for DPM discrete branching logic.
0000    162 ;
0000    163 ; 04-06 Bill Landry     27-FEB-1981
0000    164 ;       Added tests for branching logic in PHB gate array.
0000    165 ;
0000    166 ; 05-00 Dave Spain       1-MAR-1981
0000    167 ;       Added 5 SRK status rotator tests and submitted to SDC.
0000    168 ;
0000    169 ; 05-01 Dave Spain      25-MAR-1981
0000    170 ;       Fixed a loop on test bug in the Alu Functions Test by adding a LDFIELD
0000    171 ;       pseudo-op that reinitializes the ROT field in Subtest 1.
0000    172 ;
0000    173 ; 05-02 Bill Landry     25-MAR-1981
0000    174 ;       Fixed bug in BUT/NO.FPA test.  I was branching on the wrong conditions.
0000    175 ;
0000    176 ; 05-03 Dave Spain      14-APR-1981
0000    177 ;       Cleaned up documentation for R Scratchpads Write All Cells Test.
0000    178 ;
0000    179 ; 06-00 Bill Landry     2-MAY-1981
0000    180 ;       Added SPA branching, CON registers, TU58 registers, and CCS PARITY
0000    181 ;       tests.  Submitted to Release Engineering.
0000    182 ;
0000    183 ; 06-01 Dave Spain      17-JUN-1981
0000    184 ;       Replaced the old IRD1 Instruction Address Decode test with two new
0000    185 ;       tests that toggle the PSL's FPD bit and can handle an FPA.
0000    186 ;
0000    187 ; 06-02 Bill Landry     19-AUG-1981
0000    188 ;       Fixed bugs created by introduction of FPA option.
```

```
0000   189 ;       Replaced all references to COMET with the word CPU.
0000   190 ;       Fixed typing error in vbus data of CPU CLOCK TEST.
0000   191 ;       Submitted to RELEASE ENGINEERING.
0000   192 ;
0000   193 ; 06-03 Bill Landry     24-SEPT-1981
0000   194 ;       Fixed potential clock problem with FPA in Z BIT TEST 1.
0000   195 ;
0000   196 ; 06-04 Bill Landry     9-OCT-1981
0000   197 ;       Added changes for ECO L0002-TW002
0000   198 ;
0000   199 ; 07-00 Bill Landry     31-OCT-1981
0000   200 ;       Removed changes for ECO L0002-TW002.  ECO is on hold.
0000   201 ;       Added tests for FPA to CPU interface logic
0000   202 ;       Moved WCS test to MIC tape
0000   203 ;       Submitted to RELEASE ENGINEERING.
0000   204 ;
0000   205 ; 07-01 Bill Landry     13-NOV-1981
0000   206 ;       Stopped release of 7.0
0000   207 ;       Added FPA TRAP LOGIC TEST
0000   208 ;       Enhanced error messages for FPA
0000   209 ;       Resubmitted to RELEASE ENGINEERING
0000   210 ;
0000   211 ; 07-02 Bill Landry     20-NOV-1981
0000   212 ;       Stopped release of 7.1
0000   213 ;       Enhanced FPA ENABLE/DISABLE TEST to check for MSEQ INIT
0000   214 ;       Resubmitted to RELEASE ENGINEERING
0000   215 ;
0000   216 ; 07-03 Dave Shull      26-Mar-1982
0000   217 ;       Added the ERRLOOP pseudo to the Rotator Extract tests which were
0000   218 ;       missing these and couldn't be looped on.
0000   219 ;
0000   220 ; 07-04 Dave Shull      05-Apr-1982
0000   221 ;       Removed all BEGINSA and ENDSA pseudo's.
0000   222 ;       Submitted to RELEASE ENGINEERING
0000   223 ;
0000   224 ; 07-05 Dave Shull      21-May-1982
0000   225 ;       Add a subtest to the Micro Sequencer Stack Test that will test bits
0000   226 ;       11 and 12 of the micro stack.
0000   227 ;
0000   228 ; 07-06 Dave Shull      24-May-1982
0000   229 ;       Changed documentation in the CM Odd Address BUT Test to reflect the
0000   230 ;       ECO L0002-TW002
0000   231 ;
0000   232 ; 08-00 Dave Shull      18-Jun-1982
0000   233 ;       Added 10 new tests.  Two of those tests are an addition to the existing
0000   234 ;       IRD1 rom tests.  These 2 new tests check the signal ROM OS INH H.
0000   235 ;       The other 8 new tests check the validity of the IRDX ROMs.  They check
0000   236 ;       both the address and the signal ROM OS INH H.
0000   237 ;
0000   238 ; 08-01 Dave Shull      22-Jun-1982
0000   239 ;       Added a subtest to the Register Backup Stack test that will check the
0000   240 ;       bit that records Increment/Decrement of the GPR.
0000   241 ;
0000   242 ; 09-00 Dave Shull      03-Nov-1982
0000   243 ;       Added two new Tests for coverage the new PCS (L0008) module.
```

```
0000   244 ;
0000   245 ; 09-01 Dave Smith      15-May-1983
0000   246 ;       Correct DCS in ALK test 3,6,7. Disabled ALP's on the WBUS.
0000   247 ;--
0000     1          .SBTTL  ""
```

```
                                3          .SBTTL  "DIAGNOSTIC MICROCODE MACROS"
                                4 ;++
                                5 ; Revision History
                                6 ;
                                7 ; 28    Dave Spain      22-Jun-82
                                8 ;       Removed LOAD FPA SIGN REG and LOAD FPA SIGN REGS macros.
                                9 ;       Decided not to use them.
                               10 ;
                               11 ; 27    Dave Spain      15-Jun-82
                               12 ;       Added LOAD FPA SIGN REG and LOAD FPA SIGN REGS macros.
                               13 ;
                               14 ; 26    Dave Spain      19-May-82
                               15 ;       Added M[]_FPA macro.
                               16 ;
                               17 ; 25    Rich Lewis      23-Feb-82
                               18 ;       Added PSL_WB, M[]_R[].OR.NIB0(M), WB_FPA CCR, WB_FPA TCR, Q_R[].ASL.P,
                               19 ;       RDM_M[].XZ.OR.R[], FPA_WB macros
                               20 ;
                               21 ; 24    Dave Spain      02-Feb-82
                               22 ;       Added FPA_R[]+M[] macro.
                               23 ;
                               24 ; 23    Bill Landry     22-OCT-81
                               25 ;       Added PSL_RDM macro
                               26 ;
                               27 ; 22    Dave Spain       5 Oct 81
                               28 ;       Added RDM_FPA and FPA_M[] FPA_RDM macros.
                               29 ;
                               30 ; 21    Bill Landry     29 Sept 81
                               31 ;       Added FPA macro, FPA_M[] FPA_R[].
                               32 ;
                               33 ; 20    Dave Spain      14 Aug 81
                               34 ;       Added the TESTFPA [] macro.
                               35 ;
                               36 ; 19    Dave Spain      18 July 81
                               37 ;       Added the following FPA macros, FPA_RDM and FPA_R[].
                               38 ;
                               39 ; 18    Dave Spain      24 Sept 80
                               40 ;       Added RDM_Q macro. This macro uses the ALU.
                               41 ;
                               42 ; 17    Bill Landry     23 Sept 80
                               43 ;       Added macro VA_VA-ZLIT0[] for testing memory in decending order.
                               44 ;
                               45 ; 16    Dave Spain      27 August 80
                               46 ;       Changed RDM_Q macro to RDM_Q Q_D. This more accurately reflects macro.
                               47 ;
                               48 ; 15    Bill Landry     4 June 80
                               49 ;       Deleted BUS/PRB.RD.PTE from macro CLRTB.VA_VA and CLRCH.VA_VA to
                               50 ;       satisfy validity checks.
                               51 ;
                               52 ; 14    Dave Spain      23 May 80
                               53 ;       Added BUS/PRB.RD.PTE to the clear cache and clear TB macros for Mr.
                               54 ;       Bill.
                               55 ;
                               56 ; 13    Dave Spain      14 Apr 80
                               57 ;       Added SIZE[] or VSIZE/1 to some macros. This allows version 65 of
```

```
0000     58 ;       the COMET micro-code defines to run.
0000     59 ;
0000     60 ; 12    Bill Landry      1 Apr 80
0000     61 ;       Added BUS/PRB.RD micro order to RDM_TB macro to compensate for timing
0000     62 ;       problem in ADD gate array.  This is not an APRIL FOOL!
0000     63 ;
0000     64 ; 11    Dave Spain      27 Mar 80
0000     65 ;       Fixed TB macro's to include MSRC/VA to prevent validity failure.
0000     66 ;
0000     67 ; 10    Bill Landry     19 Mar 80
0000     68 ;       Added Q_R[].RL.P and VA_Q.OR.R[]
0000     69 ;
0000     70 ; 09    Bill Landry     19 Mar 80
0000     71 ;       Deleted TB_R[].RL.P.OR.D
0000     72 ;
0000     73 ; 08    Bill Landry     18 Mar 80
0000     74 ;       Added VA_R[].RL.P
0000     75 ;
0000     76 ; 07    Bill Landry     07 Mar 80
0000     77 ;       Added Q_M[].RL.PTE
0000     78 ;
0000     79 ; 06    Dave Spain      06 Mar 80
0000     80 ;       Changed TB_R[].RL.P macro to TB_R[].RL.P.OR.D.
0000     81 ;
0000     82 ; 05    Dave Spain      03 Mar 80
0000     83 ;       Added TB_R[].RL.P macro for Bill Landry.
0000     84 ;
0000     85 ; 04    Dave Spain      22 Feb 80
0000     86 ;       Added CLRTB.VA_R[] macro for Bill Landry.
0000     87 ;
0000     88 ; 03    Dave Spain      30 Jan 80
0000     89 ;       Added Tom Groetzinger's macro definitions.
0000     90 ;
0000     91 ; 02    Dave Spain      30 Jan 80
0000     92 ;       Added Tony Vezza's macro definitions.

                        0030      3 ;*******************************************************************************
                        0030      4 ;++
                        0030      5 ;
                        0030      6 ; FUNCTIONAL DESCRIPTION
                        0030      7 ;
                        0030      8 ;       This test examines the rotator's ability to convert four BCD digits on
                        0030      9 ;       MBUS to four numeric digits.
                        0030     10 ;
                        0030     11 ; TEST ALGORITHM
                        0030     12 ;
                        0030     13 ;       This test is implemented using seven 64 bit stuck at zero or one test
                        0030     14 ;       patterns. These patterns are input to the rotator from the MBUS
                        0030     15 ;       concatenated with the RBUS. They are then extracted and shuffled by
                        0030     16 ;       the convert function before being placed on the SBUS. From the SBUS
                        0030     17 ;       they are passed through the ALP's to the WBUS and the RDM's WHREG.
                        0030     18 ;       The test algorithm executes as follows:
                        0030     19 ;
                        0030     20 ;        1. Initialize the CPU.
                        0030     21 ;        2. Start signature analysis.
                        0030     22 ;        3. Load the micro-code for the first six test patterns.
                        0030     23 ;        4. Loop on I for 6 stuck at zero or one test patterns.
                        0030     24 ;        5. Generate a stuck a zero or one test pattern for a longword.
                        0030     25 ;        6. Load the pattern into the WDREG.
                        0030     26 ;        7. Loop on error from here.
                        0030     27 ;        8. Execute the micro-code to:
                        0030     28 ;               1. Load the test pattern from WDREG to MTEMP0.
                        0030     29 ;               2. Load the test pattern from WDREG to RTEMP1.
                        0030     30 ;               3. Placing RTEMP1 on the RBUS and MTEMP0 on the MBUS, execute
                        0030     31 ;                  the convert function and route the result on the SBUS
                        0030     32 ;                  through the ALP's WMUX to the RDM's WHREG.
                        0030     33 ;        9. Compare the contents of the WHREG against a table of expected data.
                        0030     34 ;       10. If the two do not match, signal an error.
                        0030     35 ;       11. Continue the loop started at step 4 for the remaining patterns.
                        0030     36 ;       12. Load the micro-code for the seventh test pattern.
                        0030     37 ;       13. Loop once on I = 7 for the last stuck at zero or one test pattern.
                        0030     38 ;       14. Loop on error from here.
                        0030     39 ;       15. Execute the micro-code to:
                        0030     40 ;               4. Load the LONLIT register with all ones.
                        0030     41 ;               5. Load MTEMP0 with zero.
                        0030     42 ;               6. Load MTEMP1 (and RTEMP1) with the LONLIT register.
                        0030     43 ;               7. Placing RTEMP1 on the RBUS and MTEMP0 on the MBUS, execute
                        0030     44 ;                  the convert function and route the result on the SBUS
                        0030     45 ;                  through the ALP's WMUX to the RDM's WHREG.
                        0030     46 ;       16. Compare the contents of the WHREG against a table of expected data.
                        0030     47 ;       17. If the two do not match, signal an error.
                        0030     48 ;       18. End the loop started at step 13.
                        0030     49 ;       19. Stop signature analysis.
                        0030     50 ;       20. End of this test, skip to the next test.
                        0030     51 ;
                        0030     52 ; TEST DATA

001F    200 ;*******************************************************************************
001F    201 ;++
001F    202 ;
001F    203 ; FUNCTIONAL DESCRIPTION
001F    204 ;
001F    205 ;       This test checks the control store address for open or shorted lines.
001F    206 ;       This test has been divided into two subtests because different logic
001F    207 ;       is involved between bits <12:06> and <05:00> of the control store
001F    208 ;       address.
001F    209 ;
001F    210 ; TEST ALGORITHM
001F    211 ;
001F    212 ;   Subtest #1
001F    213 ;
001F    214 ;       This subtest examines bits <05:00> of the control store address logic.
001F    215 ;
001F    216 ;       1.  Initialize the CPU.
001F    217 ;       2.  Prepare a loop of eight iterations.
001F    218 ;       3.  Load the Next Address field of the test micro instruction with a
001F    219 ;           test pattern read from table one for the current loop iteration.
001F    220 ;       4.  Load the test micro-instruction into DCS.
001F    221 ;       5.  Execute the micro-instruction:
001F    222 ;               1. NOP,NEXT/<test pattern>,STOP.CLOCK
001F    223 ;       6.  Do a masked compare for bits <05:00> of the control store address
001F    224 ;           lines from the RDM address trace register with the expected value
001F    225 ;           stored in RDM memory.
001F    226 ;       7.  If the two are different signal an error.
001F    227 ;       8.  Continue steps 3-6 until all eight test patterns have been used.
001F    228 ;
001F    229 ;   Subtest #2
001F    230 ;
001F    231 ;       This subtest examines bits <12:06> of the control store address logic.
001F    232 ;
001F    233 ;       9.  Prepare a second loop of eight iterations.
001F    234 ;       10. Load the Next Address field of the test micro-instruction with a
001F    235 ;           test pattern read from table two, indexed by the loop counter.
001F    236 ;       11. Load the modified test micro-instruction into DCS.
001F    237 ;       12. Execute the micro-instruction:
001F    238 ;               1. NOP,NEXT/<test pattern>,STOP.CLOCK
001F    239 ;       13. Do a masked compare for bits <12:06> of the control store address
001F    240 ;           lines from the RDM address trace register with the expected value
001F    241 ;           stored in RDM memory.
001F    242 ;       14. If the two are different signal an error.
001F    243 ;       15. Continue steps 9-12 until all eight test patterns have been used.

001F    274 ;
001F    275 ;
001F    276 ; LOGIC DESCRIPTION
001F    277 ;
001F    278 ;       In subtest 1 the MSQ, PHB and IRD gate arrays have open collector
001F    279 ;       outputs that are tied together on the lower six bits <05:00> of the
001F    280 ;       control store address. MSQ and PHB are tied together on all six bits,
001F    281 ;       but the IRD gate array is only tied to bits <03:00>. Thus when this
001F    282 ;       test first detects an error the MSQ gate array should be replaced and
001F    283 ;       then the test run again. If this test fails a second time you can
001F    284 ;       compare the expected data to the received data to give you a good clue
001F    285 ;       as to whether the PHB or IRD chip might be causing the problem. If all
001F    286 ;       three gate arrays are replaced and the test still fails then discrete
001F    287 ;       logic on the DPM is suspect.
001F    288 ;
001F    289 ;       In subtest 2 the high order eight bits of the control store address
001F    290 ;       do not go through any gate arrays. Thus if an error occurs in one of
001F    291 ;       these address lines the problem must be traced down to discrete logic
001F    292 ;       on the DPM.
001F    293 ;
001F    294 ; ASSUMPTIONS
001F    295 ;
001F    296 ;       This test requires no signals from any other CPU modules.
001F    297 ;
001F    298 ; ERROR DESCRIPTION
001F    299 ;
001F    300 ;       Subtest #1
001F    301 ;
001F    302 ;       On error subtest 1 will call out the MSQ, PHB and IRD gate arrays on
001F    303 ;       the DPM module.
001F    304 ;
001F    305 ;       Subtest #2
001F    306 ;
001F    307 ;       On error subtest 2 will call out only the DPM module since no gate
001F    308 ;       arrays are attached to bits <12:06> of the control store address.
```

```
                     001F    309 ;
                     001F    310 ;       On error both subtests will also type out the following information:
                     001F    311 ;
                     001F    312 ;       Expected Data:
                     001F    313 ;       Received Data:
                     001F    314 ;       Loop Count:
                     001F    315 ;
                     001F    316 ;--

001F    400 ;*****************************************************************************
001F    401 ;++
001F    402 ;
001F    403 ; FUNCTIONAL DESCRIPTION
001F    404 ;
001F    405 ;         This test will examine the micro stack logic on the DPM. This test
001F    406 ;       contains two subtests, the first examines the data integrity of each
001F    407 ;       stack location while the second will check to make sure all 16 micro-
001F    408 ;       stack locations are tested.
001F    409 ;
001F    410 ; TEST ALGORITHM
001F    411 ;
001F    412 ;   Subtest #1
001F    413 ;
001F    414 ;       1.  Initialize the CPU.
001F    415 ;       2.  Prepare a loop of 16 iterations.
001F    416 ;       3.  Prepare a second loop of 6 iterations.
001F    417 ;       4.  Load the next address field of the JSR micro-instruction with a
001F    418 ;           test data pattern from Table 1 indexed by the loop counter.
001F    419 ;       5.  Load the micro-instruction at the proper location in DCS.
001F    420 ;       6.  Execute the micro-instructions:
001F    421 ;                1. NOP
001F    422 ;                2. NOP,NEXT/<test pattern>
001F    423 ;                3. JSR/PUSH
001F    424 ;                4. BUT/RETURN,NEXT/0000
001F    425 ;                5. STOP.CLOCK
001F    426 ;       7.  Compare the result in the RDM address trace register with the
001F    427 ;           expected data stored in the RDM.
001F    428 ;       8.  If the two are different signal an error.
001F    429 ;       9.  Continue steps 4-7 until all 6 test patterns have been used.
001F    430 ;       10. Load the next address field of a JSR micro-instruction with the
001F    431 ;           data pattern from Table 2 indexed by the loop counter.
001F    432 ;       11. Load the micro-instruction at the proper location in DCS.
001F    433 ;       12. Execute the micro-instructions:
001F    434 ;                5. NOP
001F    435 ;                6. NOP,NEXT/<test pattern>
001F    436 ;                7. JSR/PUSH
001F    437 ;                8. STOP.CLOCK
001F    438 ;       13. Continue steps 3-11 until all 16 stack locations have been pushed.
001F    439 ;
001F    440 ;   Subtest #2
001F    441 ;
001F    442 ;       13. Prepare a second loop of 16 iterations.
001F    443 ;       14. Execute the micro-instructions:
001F    444 ;                9. NOP
001F    445 ;               10. BUT/RETURN,NEXT/0000
001F    446 ;               11. STOP.CLOCK
001F    447 ;       15. Compare the result in the Control Store Address Latch with the
001F    448 ;           original data pushed onto the stack.
001F    449 ;       16. If the two are different signal an error.
001F    450 ;       17. Continue steps 14 and 15 until all 16 addresses have been popped
001F    451 ;           off the micro stack.
001F    452 ;       18. Test completed.
001F    453 ;

001F    493 ; LOGIC DESCRIPTION
001F    494 ;
001F    495 ;       This test examines the following discrete logic on the DPM:
001F    496 ;
001F    497 ;       Subtest 1.  Micro-stack as implemented by four 16X4 RAMs on the DPM.
001F    498 ;       Subtest 2.  Micro-stack address lines <10:00> on the DPM.
001F    499 ;
001F    500 ; ASSUMPTIONS
001F    501 ;
001F    502 ;       This test requires no signals from any other CPU modules.
001F    503 ;
001F    504 ; ERROR DESCRIPTION
001F    505 ;
001F    506 ;       On an error in Subtest 1 & 3 only the DPM will be called out. On an
001F    507 ;       error in Subtest 2 the MSQ gate array and the DPM will be called out.
001F    508 ;
```

```
                        509 ;       On error both subtests will also type out the following information:
                        510 ;
                        511 ;       Expected Data:
                        512 ;       Received Data:
                        513 ;       Index I:
                        514 ;
                        515 ;       Subtest 2 will also type out Index J.

0021          .SBTTL  "TEST   068     Check PCS RAM Data Integrity
0021    926 ;*****************************************************************************
0021    927 ;++
0021    928 ;
0021    929 ; FUNTIONAL DESCRIPTION:
0021    930 ;
0021    931 ;       This test will write six different data patterns to all of the PCS
0021    932 ;       locations and then read them back to insure there are no data integrity
0021    933 ;       problems.
0021    934 ;
0021    935 ; TEST ALGORITHM:
0021    936 ;
0021    937 ;        1.  Initialize the CPU
0021    938 ;        2.  Execute the microcode to:
0021    939 ;               a.  Disable Cache
0021    940 ;               b.  Enable the CMI
0021    941 ;        3.  Set error loop address
0021    942 ;        4.  Let RDM know that we expect a micro trap
0021    943 ;        5.  Execute the microcode to:
0021    944 ;               a.  Load VA with PCS Base address
0021    945 ;               b.  Write a test pattern to VA
0021    946 ;               c.  Give time for write to complete
0021    947 ;               d.  Read the location by the VA
0021    948 ;               e.  Pass read data back to RDM
0021    949 ;        6.  Check for micro trap.  If there is a micro trap, PCS (L0008) is
0021    950 ;            not installed on the system, then do the following:
0021    951 ;               a.  Execute the microcode to:
0021    952 ;                      i.  Point to Bus Error Register
0021    953 ;                     ii.  Pass the Bus Error Register back to the RDM
0021    954 ;               b.  Check to see if NXM bit is set.
0021    955 ;               c.  If NXM bit was not set then call an error, got a bit set
0021    956 ;                   that shouldn't have been.
0021    957 ;               d.  Skip to next test
0021    958 ;         7.  Check to see that read data matches the write pattern.
0021    959 ;         8.  Call an error if read data and write pattern did not match.
0021    960 ;         9.  Set-up a loop of 6 iterations
0021    961 ;        10.  Load the micro code to write a test pattern to all of PCS
0021    962 ;        11.  Load the WDREG with the test pattern
0021    963 ;        12.  Set-up DCS at starting micro address
0021    964 ;        13.  Insure that the Clocks are turned off
0021    965 ;        14.  Load match register with 1801(hex)
0021    966 ;        15.  Clear master halt enable
0021    967 ;        16.  Set bit to watch for micro traps
0021    968 ;        17.  Start the CPU clocks
0021    969 ;        18.  Perform a Watchdog loop while executing the microcode to:
0021    970 ;             (if loop count expires then force an error, shouldn't happen)
0021    971 ;               a.  Load RTEMP0 with the test pattern
0021    972 ;               b.  Load the VA with enable register address
0021    973 ;               c.  Write the enable register with 0 to enable writing of PCS
0021    974 ;               d.  Load the VA with PCS starting address
0021    975 ;               e.  Jump to DCS address 0
0021    976 ;               f.  Pass the current VA to the RDM
0021    977 ;               g.  Write the test pattern in RTEMP0
0021    978 ;               h.  Give time for the write to complete
0021    979 ;               i.  Update the VA by 4
```

```
0021   980 ;                    j.  Check to see if VA is equal to PCS last address + 4
0021   981 ;                          i.  If VA is equal to last address + 4 then there
0021   982 ;                              will be a micro match at address 1801
0021   983 ;                         ii.  If VA is Not equal to last address + 4 then
0021   984 ;                              microcode execution procedes as normal.
0021   985 ;                    k.  Jump to DCS address 0 ( goto step 18-f, continue
0021   986 ;                        writing the test pattern until VA is equal to PCS last
0021   987 ;                        address + 4)
0021   988 ;            19.  Load microcode to read all of PCS
0021   989 ;            20.  Set error loop address
0021   990 ;            21.  Set-up DCS at starting micro address
0021   991 ;            22.  Insure that the Clocks are turned off
0021   992 ;            23.  Load match register with 1801(hex)
0021   993 ;            24.  Clear master halt enable
0021   994 ;            25.  Set bit to watch for micro traps
0021   995 ;            26.  Start the CPU clocks
0021   996 ;            27.  Perform a Watchdog loop while executing the microcode to:
0021   997 ;                 (if loop count expires then force an error, shouldn't happen)
0021   998 ;                    a.  Load the VA with enable register address
0021   999 ;                    b.  Write a zero to VA which will enable writing/reading of
0021  1000 ;                        PCS
0021  1001 ;                    c.  Load the VA with PCS starting address
0021  1002 ;                    d.  Jump to DCS address 0
0021  1003 ;                    e.  Pass the current VA to the RDM
0021  1004 ;                    f.  Read the PCS location by the VA
0021  1005 ;                    g.  Mask out the low 20 bits (upper 12 bits no used)
0021  1006 ;                    h.  Check the read data to see if correct
0021  1007 ;                          i.  If not correct then there will be a micro match
0021  1008 ;                              at address 1801
0021  1009 ;                         ii.  If data correct then microcode execution procedes
0021  1010 ;                              as normal
0021  1011 ;                    i.  Check to see if VA is equal to PCS last address
0021  1012 ;                          i.  If VA = F0BFFC then there will be a micro match
0021  1013 ;                              at address 1801
0021  1014 ;                         ii.  If VA not equal to F0BFFC then microcode
0021  1015 ;                              execution procedes as normal
0021  1016 ;                    j.  Update the VA by 4
0021  1017 ;                    k.  Jump to DCS address 0 (goto step 27-e, continue reading
0021  1018 ;                        and checking data until either there is a data error or
0021  1019 ;                        until the last PCS address has been checked.
0021  1020 ;            28.  Check for a machine check
0021  1021 ;            29.  If there was a machine check then call an error
0021  1022 ;            30.  Check the WHREG (VA) to see that we made it to the last PCS
0021  1023 ;                 address.
0021  1024 ;            31.  If WHREG was not equal to PCS last address then there must have
0021  1025 ;                 been a data error, Call an error.
0021  1026 ;            32.  Continue with loop I for six test patterns ( goto step 10).
0021  1027 ;            33.  Skip to next test
0021  1028 ;
0021  1029 ; TEST PATTERNS:
0021  1030 ;
0021  1031 ;            The following six test patterns are used to check PCS RAM's:
0021  1032 ;

                1579 ;*******************************************************************************
                1580 ;++
                1581 ;
                1582 ; FUNCTIONAL DESCRIPTION
                1583 ;
                1584 ;         This test will examine the control store parity error logic for pro-
                1585 ;       per operation. This test is comprised of two subtests.The first subtest
                1586 ;       examines the logic that implements the CS parity error micro-trap,while
                1587 ;       the second subtest examines the same micro - trap  during a  BUT/RETURN
                1588 ;       operation.
                1589 ;
                1590 ; TEST ALGORITHM
                1591 ;
                1592 ;       Subtest 1
                1593 ;
                1594 ;       Examine the control store parity logic for a CS address of 20 hex
                1595 ;       during a control store parity error.
                1596 ;
                1597 ;       1.  Initialize the CPU.
                1598 ;       2.  Change the parity field of the micro-instruction for the first
                1599 ;           subtest to force a control store parity error.
                1600 ;       3.  Load the micro-instructions for the first subtest into DCS.
                1601 ;       4.  Prepare the RDM to expect a control store parity error.
                1602 ;       5.  Execute the micro-instructions:
                1603 ;               1. NOP
                1604 ;               2. NEXT/3FFF,STOP.CLOCK ; Micro-instruction with CSPE
                1605 ;       6.  Compare the contents of the CS address trace register with the
                1606 ;           expected control store address of 20 hex.
                1607 ;       7.  If the comparison shows that the two are not equal, signal an
                1608 ;           error.
                1609 ;
                1610 ;       Subtest 2
                1611 ;
                1612 ;       Examine the control store parity logic for a CS address of 20 hex
                1613 ;       when the CPU is executing a BUT/RETURN operation.
                1614 ;
                1615 ;       8.  Change the parity field of the micro-instruction for the second
                1616 ;           subtest to force a control store parity error.
                1617 ;       9.  Load the micro-instructions for the second subtest into DCS.
                1618 ;       10. Prepare the RDM to expect a control store parity error.
                1619 ;       11. Execute the micro-instructions:
                1620 ;               3. NOP
                1621 ;               4. JSR/PUSH,NEXT/3FFF
                1622 ;               5. BUT/RETURN,NEXT/0000,STOP.CLOCK      ; CSPE here
                1623 ;       12. Compare the contrents of the CS address trace register with the
                1624 ;           expected control store address of 20 hex.
                1625 ;       13. If the comparison shows that the two are not equal, signal an
                1626 ;           error.
                1627 ;       14. Test completed.
                1628 ;
                1629 ; DATA PATTERNS
                1630 ;
                1631 ;       There are three data pattern used in this test:
                1632 ;
```

```
                        002F  1633 ;       1. 3FFF hex fills the next address field with ones.
                        002F  1634 ;
                        002F  1635 ;       2. 0020 hex is the expected micro-address for a control store parity
                        002F  1636 ;          error.
                        002F  1637 ;
                        002F  1638 ;       3. 0000 hex is OR-ed with 3FFF in the BUT/RETURN operation for the
                        002F  1639 ;          second subtest.
                        002F  1640 ;
                        002F  1641 ; LOGIC DESCRIPTION
                        002F  1642 ;
                        002F  1643 ;       This test examines the MSQ gate array for the proper generation of the
                        002F  1644 ;       signal ZERO HIGH NEXT on DPM-14. ZERO HIGH NEXT runs to DPM-13 and
                        002F  1645 ;       provides the enable to the tri-state drivers on CS bits <13:06>. These
                        002F  1646 ;       drivers force a zero onto bits <13:06> of the CS address whenever ZERO
                        002F  1647 ;       HIGH NEXT is active.
                        002F  1648 ;
                        002F  1649 ;       Also tested is the micro-vector logic which is hard wired onto bits
                        002F  1650 ;       <05:00> of the CS address with the MSQ gate array using open collector
                        002F  1651 ;       logic. The micro-vector enable signal comes from the SAC gate array.
                        002F  1652 ;

001E  2081 ; LOGIC DESCRIPTION
001E  2082 ;
001E  2083 ;       This test consists of two parts. The first part examines the low order
001E  2084 ;       two bits of address to make sure they are not stuck at one or zero.
001E  2085 ;       The second part will test the carry logic within the incrementer by
001E  2086 ;       floating a zero across all bits in the PC while rippling a carry into
001E  2087 ;       the zero from the incrementer.
001E  2088 ;
001E  2089 ; ASSUMPTIONS
001E  2090 ;
001E  2091 ;       This test assumes that the DPM, WBUS and MBUS are functional. Since
001E  2092 ;       this test requires the use of the instuction prefetch mechanism, all
001E  2093 ;       tests on the VA, PC, the two execution buffers, cache, translation
001E  2094 ;       buffer and WDR must also have been successfully completed.
001E  2095 ;
001E  2096 ; ERROR DESCRIPTION
001E  2097 ;
001E  2098 ;       Below is a table of possible error symptoms and their most likely
001E  2099 ;       causes:
001E  2100 ;
001E  2101 ;               Symptom                         Probable Cause
001E  2102 ;       +-----------------------+-----------------------------------------+
001E  2103 ;       | An error is called out| A defective PRK gate array is causing   |
001E  2104 ;       | regardless of whether | the incrementer or PC from being sent   |
001E  2105 ;       | the expected data was | out on the address lines.               |
001E  2106 ;       | AAAAAAAA or 55555555. |                                         |
001E  2107 ;       +-----------------------+-----------------------------------------+
001E  2108 ;       | An error is called out| A problem with either the logic used    |
```

```
                                ;       | when the expected data | to load the PC or the PC register |
                                ;       | was AAAAAAAA.          | itself. The PC register diagnostic |
                                ;       |                        | should be run to isolate the problem. |
                                ;       +------------------------+---------------------------------------+
                                ;       | An error is called out |                                       |
