Figure 1-1. The 4114 Computer Display Terminal.

Section 1

INTRODUCTION

The 4114 Computer Display Terminal Service Manual is divided into two volumes. Volume 1 includes introductory information, operating information, circuit theory, functional check and performance check procedures, a detailed description of the adjustment procedure, troubleshooting and self test diagnostic, and maintenance information. Volume 1 is primarily a reference manual. Volume 2, on the other hand,

contains frequently used information that the service technician needs to troubleshoot, repair, and adjust the terminal in the field. This information includes an abbreviated adjustment procedure, electrical and mechanical parts lists, block and schematic diagrams, installation information, and the Self Test diagnostic program, which is a built-in, firmware troubleshooting aid.

RELATED DOCUMENTS

Detailed information on the use of the 4114 terminal is found in the following documents.

- 4114 Computer Display Terminal Operator's Manual
- 4114 Host Programmer's Manual
- 4110 Series Command Reference Manual
- 4114 Introduction Brochure

GENERAL DESCRIPTION

The 4114 is a high-resolution, microprocessor-controlled graphics computer terminal. The display is a 19-inch diagonal direct view storage tube. More than 12 million points on the display surface are individually addressable. By using these points, the display presents a graphic image made up of line segments. This image is displayed in either of two modes: Storage mode or Refresh mode. In Storage mode, the image is stable and permanent on the screen until it is erased. In Refresh mode, the image is continuously renewed, and therefore is easily moved around the screen surface. Graphics images can be contracted using both modes at the same time.

The 4114 uses microprocessor technology to create more than 100 primarily graphics-related commands. Using these commands, a host-resident software program run on a 4114 can create graphic images that can be displayed, modified, and sent to and received from a host computer. The 4114 carries most of the graphics processing-time burden if its local graphics commands are used.

The standard 4114 contains 32 K of RAM (read/write) memory and can contain up to 800 K of RAM memory on optional RAM Controller boards. As much as one megabyte of words can be stored on the optional flexible disks — 512 K bytes per disk. The maximum host computer communication speed ("baud rate") is 19,200 bits per second for graphics and 38.4 K bits per second for text.

Set-Up mode uses English-language type commands to initialize many terminal operating parameters. Three of the major classifications are: general, dialog, and communications. In the general group, parameters like margin, echo, and Snoopy mode are set. In the dialog group, parameters like buffer size, line width, and number of lines are set. And in the communications group, parameters such as number of stopbits, kind of parity, and end-of-line string are set.

INTRODUCTION

Most commands for the 4114 are encoded as three character ASCII codes beginning with the ESC character. The host computer controls the 4114 by sending it these three character ESC sequences in the order determined by each specific job to be done. (The Set-Up mode commands are encoded both as English-language type commands and as ESC sequences.)

Many features of the 4014 Computer Display Terminal are emulated by the 4114 terminal. Because of this, most application programs written for the 4014 run on the 4114 with very little or no modification. In addition, most peripheral devices that function connected to the 4014 also function when they are connected to the 4114. This includes Tektronix hard copy units and plotters.

PHYSICAL DESCRIPTION

The 4114 consists of two main parts: the display module and the pedestal. The display module sits on four plastic bumpers (feet) on top of the pedestal. After the terminal is installed, the display module and pedestal are connected by two cables — the AC Display power cable and the display cable.

The display module contains a 19-inch direct view storage tube. The mechanical package is similar to the Tektronix 618 Display Monitor. The display electronics inside the display module include high voltage and Z axis, storage, deflection amplifier, hard copy amplifier, and low voltage power supply circuitry. This circuitry is similar to that in the Tektronix GMA102A Display Monitor.

The pedestal consists of the keyboard, the low voltage power supply, the card cage, and six mounting plates on the rear panel.

The keyboard has a standard typewriter-like layout of ASCII-encoded keys. There are eight programmable and four command keys along with four LED indicator lights situated above the standard ASCII keys. There are also two thumbwheels — one moving up and down (controlling vertical motion on the screen) and one moving across (controlling horizontal motion on the screen).

Above the keyboard is the power switch. Optional flexible disk assemblies may be installed on one or both sides of the power switch.

The card cage and low voltage power supply are found inside the pedestal below the keyboard. The card cage contains plug-in circuit boards with dimensions of 8.5 by 11.5 inches.

The standard 4114 contains the following circuit boards:

- Motherboard. This has slots for five standard size circuit boards. The 80 pin bus of the Motherboard is the System Bus.
- Processor board.
- RAM/ROM board. This contains system EPROM and one 32 K RAM Array board.
- Display Controller board.
- Vector Generator board.

Figure 1-2 shows the Motherboard card slot locations and priority. If two or more bus masters are contending for control of the bus, it is necessary to assign a "bus priority" to each of the bus masters. This is done by inserting the board with highest priority in Motherboard slot connector J1, the next highest priority board in J2, etc. Since the Disk Controller Board requires the highest priority for DMA operations, it is always inserted in J1. The Processor Board goes in J2, and the Display Controller Board in J4.

Note that the above placement of boards in the Motherboard yields the highest possible priority for each board. A board placement that preserves the relative priorities of the boards, for example, is the following: Disk Controller in J3, Processor Board in J4, and Display Controller in J5. The boards operate properly when given relative priority position.

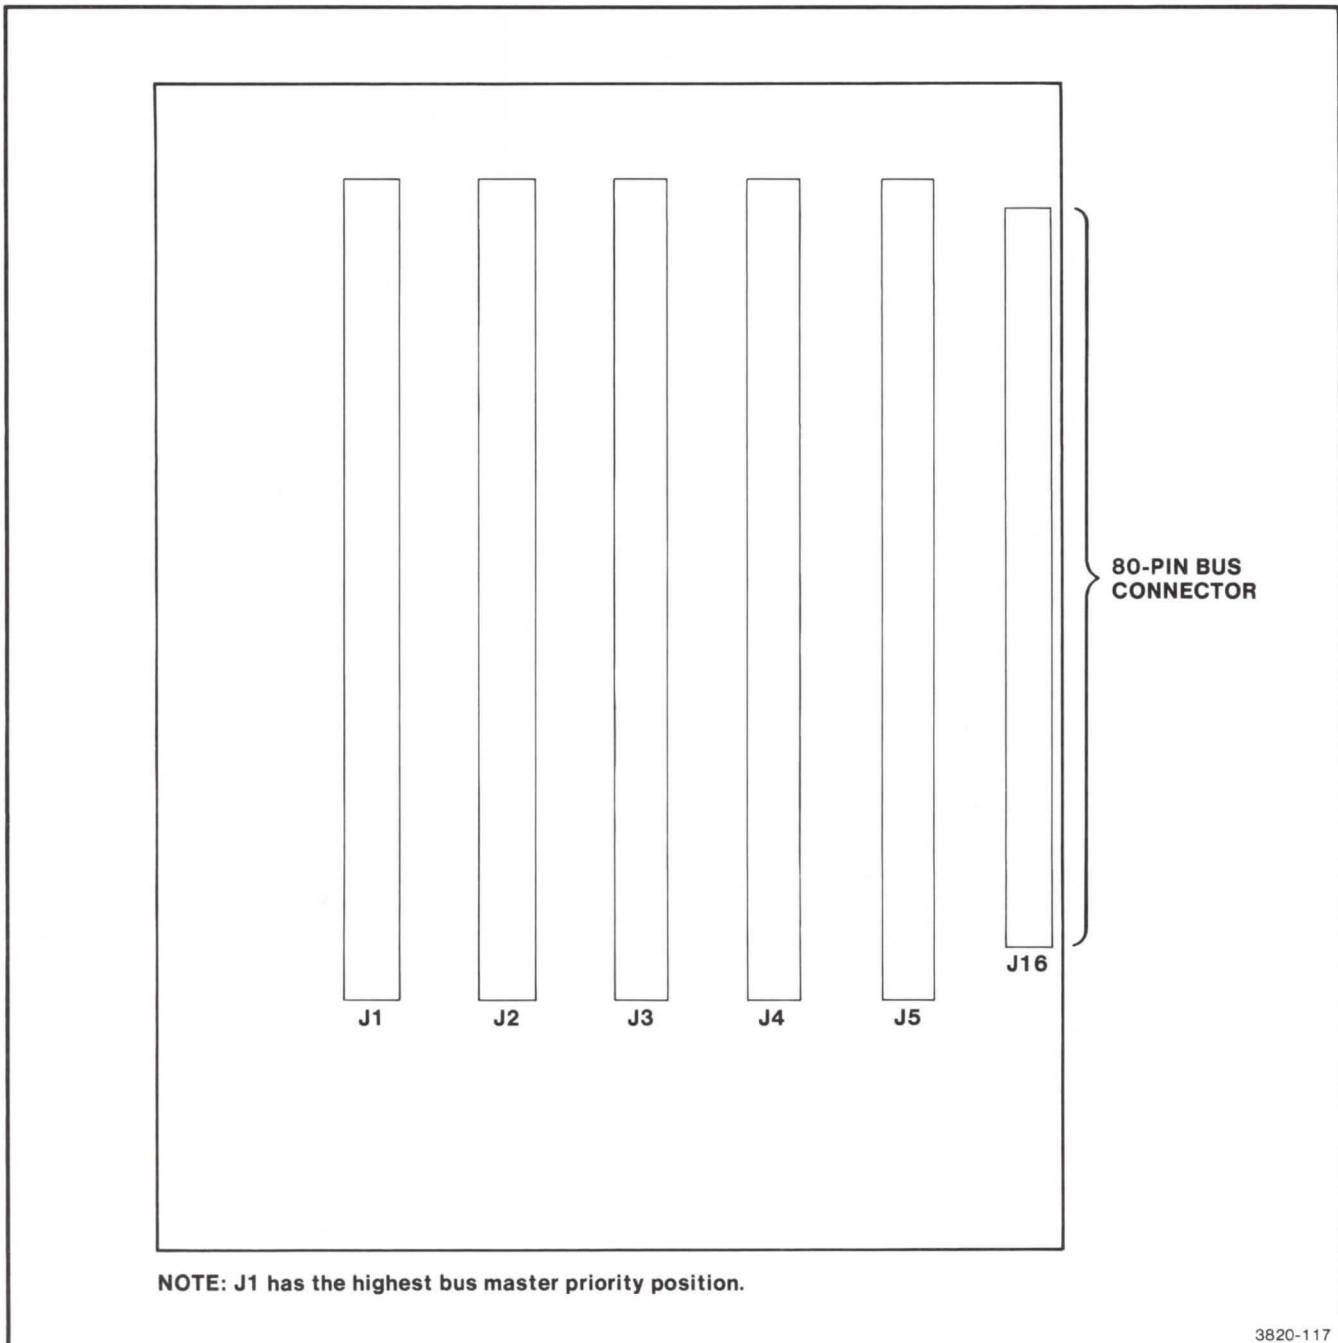

Figure 1-2. 4114 Motherboard.

INTRODUCTION

The 4114 may contain these optional circuit boards:

- Motherboard Extender. This increases the System Bus slots of the Motherboard to fifteen total slots. (Option 40 or 41)
- Three Port Peripheral Interface (3PPI) board. (Option 10)
- Tablet Controller board. (Part of Option 13 and 14)
- Disk Controller board. (Part of Option 42 and 43)

The low voltage power supply provides all the operating voltages for the Pedestal circuitry and is located above and to the right of the card cage — looking at the card cage from the front.

There are six removable mounting plates on the rear panel of the pedestal. One is standard and five hold optional connectors or L-brackets. The standard RS-232 host computer connector is mounted to the standard plate. The display cable connector is mounted here also.

OPTIONS

The following list of options is arranged in numerical order. Option numbers beginning with a letter designation are placed at the end of the list.

- | | |
|-----------|---|
| Option 1 | Extended Communications (includes half-duplex, block mode, and downloader). |
| Option 2 | Current Loop Interface (see Current Loop Interface Service Manual for detailed service information). |
| Option 4A | United Kingdom Keyboard. Hardware is identical to standard keyboard, except for keyboard ROMs. |
| Option 4C | Swedish Keyboard. Same hardware as other keyboards. |
| Option 4E | APL Keyboard. Same hardware as other keyboards. |
| Option 4F | Danish and Norwegian Keyboard. Same hardware as other keyboards. |
| Option 10 | Three Port Peripheral Interface (3PPI). This option supports the following peripheral devices:

4662 and 4663 Plotters
4641 and 4642 Printers
4923 Tape Recorder with Option 1 installed and other RS-232 devices |

See the 4110 Series Option 10 3PPI Service and 4114 Operator's Manuals for details.

- | | |
|-----------|--|
| Option 13 | Graphic Tablet. Size: 11 by 11-inches. Option hardware includes: Graphic Tablet (and pen), 411X Tablet Controller board, and Tablet Interface board. See the 4110 Series F13/14 Graphics Tablet Instruction and 4114 Operator's Manuals. |
| Option 14 | Graphic Tablet. Size: 30 x 40-inch. Option hardware includes: Graphic Tablet (and pen), 411X Tabet Contoller board, and Tablet Interface board. See the 4110 Series F13/14 Graphics Tablet Instruction and 4114 Operator's manuals. |
| Option 24 | One RAM Controller Board. Includes 32 K bytes of RAM on one RAM Array Board. Service information is in Appendix B of this manual. |
| Option 25 | One RAM Controller Board. Includes 64 K bytes of RAM on two RAM Array Boards. For service information, see Opt. 24. |
| Option 26 | One RAM Controller Board. Includes 96 K bytes of RAM on three RAM Array Boards. For service information, see Opt. 24. |
| Option 27 | One RAM Controller Board. Includes 128 K bytes of RAM on four RAM Array Boards. For service information, see Opt. 24. |

Option 28	Two RAM Controller Boards. Includes 256 K bytes of RAM on eight RAM Array Boards. For service information, see Opt. 24.	Option 43	Dual Flexible Disk Drives and one Disk Controller board. The service information is located in the Option 42/43 Service Manual, and 119-0977-01/03 Drive Unit Service Manual.
Option 29	Four RAM Controller Boards. Includes 512 K bytes of RAM on sixteen RAM Array Boards. For service information, see Opt. 24.	Option 52	Customer-specified line voltage and frequency option.
Option 30	Local Easy Graphing.	Option A1	Universal European line voltage and frequency: 220 V, 50 Hz.
Option 31	Color Enhanced Refresh. Display Module has special DVST that writes refreshed vectors in yellow-orange.	Option A2	United Kingdom line voltage and frequency: 240 V, 50 Hz.
Option 40	Ten-Slot Peripheral Bus Extender. Includes Motherboard Extender, wire kit, and two 7 watt fans.	Option A3	Australian line voltage and frequency: 240 V, 50 Hz.
Option 41	Same as Option 40 except 14 W fans for Japan.	Option A4	North American line voltage and frequency: 240 V, 60 Hz.
Option 42	Single Flexible Disk Drive, and one Disk Controller board. The service information is located in the Option 42/43 Service Manual, and 119-0977-01/03 Drive Unit Service Manual.	Option A5	Switzerland line voltage and frequency: 220 V/10 A, 50 Hz.

ACCESSORIES

This list is divided into two parts: the standard accessories that are supplied with each 4114, and those accessories that may be ordered separately in addition to the standard accessories. The following accessories are also found in the parts list, where part numbers are listed for each item.

Standard Accessories:

- 4114 Computer Display Terminal Operator's Manual
- 4110 Series Command Reference Manual
- Power cord set
- Host Port RS-232 cable
- Eight relegendable key caps
- Six function key overlays
- 4114 Host Programmer's Manual
- 4114 Introduction Brochure

Optional Accessories:

- Relegendable key caps
- Function key overlays
- 4114 Service Manual, Volume 1
- 4114 Service Manual, Volume 2
- 4110 Series Option 10 Three Port Peripheral Interface (3PPI) Manual
- 4110 Series Option 13/14 Graphics Tablet Manual
- 4110 Series Option 42/43 Disk Drives Manual
- 119-0977-01/03 Flexible Disk Drive Instruction Manual
- RS-232 Loopback Connector
- Current Loop Loopback Connector

Section 2

INSTALLATION

INTRODUCTION

WARNING

Dangerous voltages exist within the terminal. Use normal electrical precautions when working inside the terminal.

Installation consists of locating a suitable installation site, unpacking the terminal, checking operating voltages, applying power, testing the internal operation with Self Test, connecting the terminal to a host computer, and testing communication between the host computer and the terminal.

The terminal is packaged as two units: the pedestal and the display module. Once these are unpacked, the display module is placed on the pedestal and the power, display, and RS-232 communication cables are connected. No further assembly is required. However, if new options are to be installed, disassembly of the terminal may be required. THIS SHOULD BE DONE BY QUALIFIED SERVICE TECHNICIANS ONLY.

SELECTING AN INSTALLATION SITE

The primary requirement for proper operation is adequate ventilation clearance around the terminal. Make sure, especially, that the heat sink at the back of the terminal has at least two inches (5.08 cm) clearance from the nearest wall or surface. More clearance provides better ventilation and greater reliability. The terminal consumes a maximum of about 800 watts (2720 BTU/hour). Typical consumption is about 500 watts (1700 BTU/hour).

Temperature should be within the range of + 10 to + 40 C (50 to 104 F) without the flexible disk drive(s) option (Option 42/43) and + 10 to + 36 C (50 to 97 F) with the option. Relative humidity should be a maximum of 75% without Option 42/43 and within the range of 20% to 75% with Option 42/43.

Use Figure 2-1, 4114 Dimensions, to determine how much space is required for the terminal.

INSTALLATION

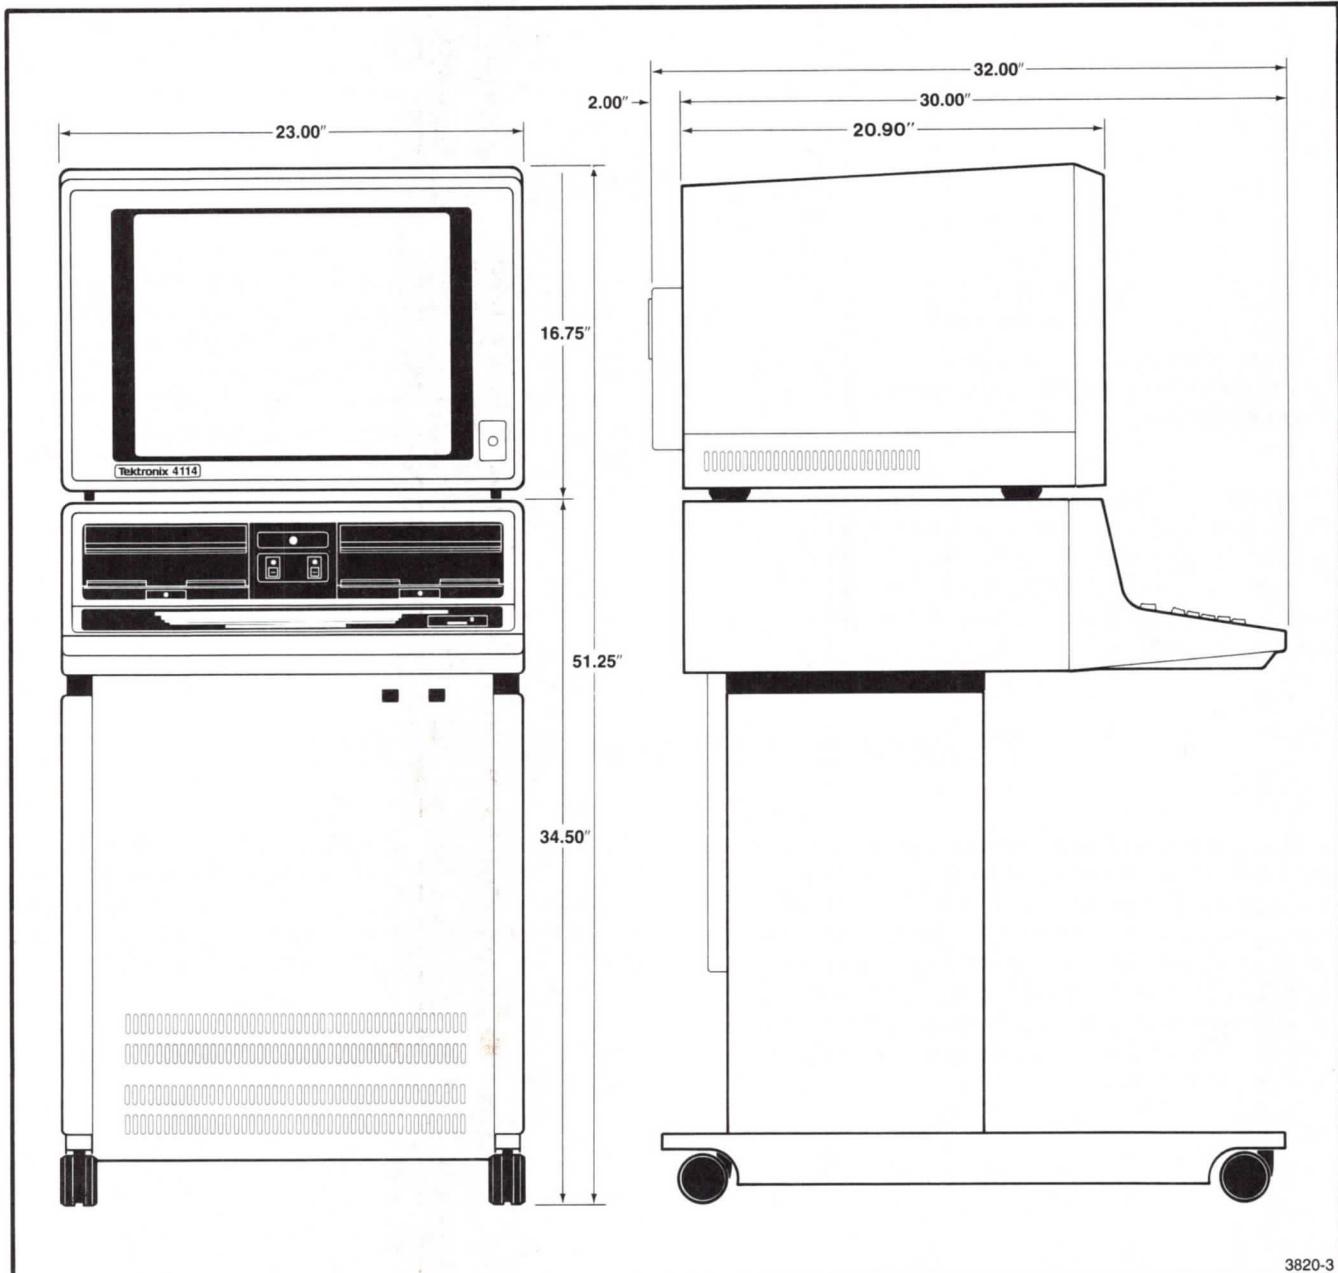

Figure 2-1. 4114 Dimensions.

UNPACKING THE TERMINAL

The terminal is shipped in two cartons. The small carton contains the display module plus packing material. The large carton contains the pedestal, the ordered accessories, and some packing materials.

WARNING

Both shipping cartons are HEAVY. Two people should do the lifting necessary to install the terminal. Please use proper lifting techniques to avoid injury to yourselves or the terminal.

Before opening the cartons, gather these tools: a medium-size flat-bladed screwdriver, a carton opener (a small stout-bladed knife), and a medium-size — about two feet long — crowbar (pinch bar).

During the unpacking procedure, check the packing list against the terminal, accessories, and any options also ordered to make sure that they agree. Refer to the following lists.

Standard accessories included with the 4114 are:

- 4114 Computer Display Terminal Operator's Manual
- 4110 Series Command Reference Manual
- Power cord set
- Host Port RS-232 cable
- Eight relegendable key caps
- Six function key overlays
- 4114 Host Programmer's Manual
- 4114 Introduction Brochure

Optional Accessories:

- Relegendable key caps
- Function key overlays
- 4114 Service Manual Volume 1
- 4114 Service Manual Volume 2
- 4110 Series Option 10 Three Port Peripheral Interface (3PPI) Manual
- 4110 Series Option 13/14 Graphic Tablets Manual
- 4110 Series Option 42/43 Flexible Disk Drives Manual
- 119-0977-00 Flexible Disk Drive Instruction Manual
- RS-232 Loopback Connector
- Current Loop Loopback Connector

Before beginning the unpacking procedure, carefully inspect both shipping cartons for any signs of damage. Report any damage to the carrier and the local Tektronix sales representative immediately.

1. Use the carton opener to cut the plastic straps on the pedestal carton. Lift the carton straight up and over the pedestal. Note that the packages containing the standard accessories are placed on top of the packing material protecting the top of the terminal. Look in the carton for these packages if they are not seen immediately on top of the terminal. Remove any packing material from the top of the terminal.
2. The pedestal is secured to the shipping pallet by two boards that are power-stapled over the roller legs both in front and in back of the lower portion of the pedestal. Use the crowbar to pry both boards loose from the pallet structure.

WARNING

The sharp ends of the staples in the two boards need to be placed a safe distance away from all foot traffic.

3. Lift the pedestal off the pallet and set it down. Remove the pallet from the immediate area.
4. Lift the display module carton onto a table or other suitable surface near the pedestal.
5. Open the top of the carton with the carton opener and remove the packing material. Slit the carton at three of its vertical edges; then remove the display module from the carton and set it on the pedestal top. (Save the shipping cartons and packaging material in case the terminal needs to be shipped again. See Packaging For Shipment at the end of this section.)

CHECKING THE OPERATING VOLTAGE

CAUTION

If the terminal is not set for the proper operating voltage, and the terminal is connected to a voltage different from what it is set for, serious damage to the terminal may occur.

The terminal has two yellow voltage indicators that should be checked to see that the terminal is set to the proper ac power supply for the site. Make sure that the indicator on the pedestal and the one on the display module both are set to show the same value and that the value is correct. These yellow indicators are located on the back of each unit near the ac power receptacles. (Note that changing the yellow indicator does not change the internal voltage settings.)

CAUTION

Installation of new options and changing the operating voltages for the 4114 should be done by qualified service personnel only. Procedures for changing the operating voltage are located in the Maintenance section of the 4114 Service Manual Volume 1. Procedures for installing options are found in Volume 1 of this manual or the manual describing the option.

CONNECTING CABLES AND APPLYING POWER

There are two cables connecting the pedestal and display module — the ac power cable and the display cable. In addition, the pedestal has its ac power cable connecting it to a power outlet and its RS-232 communication cable connecting it to a modem or directly to the host computer. The 4114 should be operated only with all of these cables properly connected.

1. Refer to Figure 2-2 and attach the display cable to the pedestal. Tighten alternately the screws on either side of the cord. Use a small, flat-bladed screwdriver to tighten the screws.
2. Attach the host port RS-232 cable to the modem and pedestal. Use the screwdriver to secure the connectors.
3. Make sure the power button on the front is in the OFF position. Then plug the AC display power cable into the pedestal and the display module. Connect the AC power cable to the pedestal and an ac power outlet.
4. Push in the power button. Wait a few minutes until the keyboard LEDs all go off. The cursor should appear in the upper left corner of the screen. If it does not appear, refer to the Self Test section.

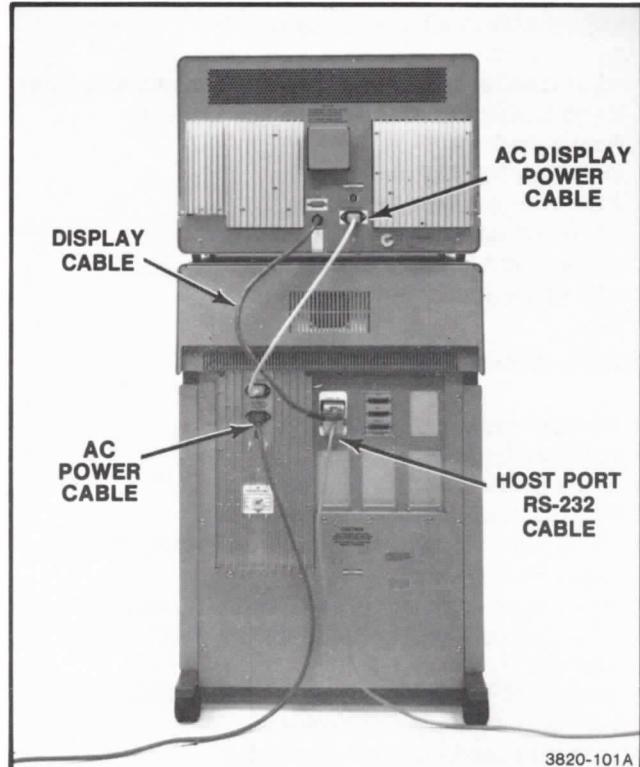

Figure 2-2. Power, RS-232, and Display Cables.

TESTING THE TERMINAL (SELF TEST)

NOTE

More about Self Test is found in Section 5 of this manual. The following procedures are just for verification of correct operation of the terminal. If the terminal fails to pass one of the two versions of Self Test, a malfunction code stays lit on the keyboard LED lights. To decode the malfunction, consult Self Test in Section 5.

When the terminal is turned on, it runs through a power-up, Self Test routine. This routine tests about 30% of the circuitry in the terminal. If a malfunction is found during the power-up routine, a malfunction message appears on the eight keyboard LEDs. The LED light patterns are interpreted as a two digit hexadecimal number. The righthand four LEDs (bits) form the least significant hexadecimal digit, and the lefthand four LEDs (bits) form the most significant hexadecimal digit. For first time operation, a more detailed version of Self Test should be run. A brief outline of how to perform this test follows. Refer to Section 5 of this manual for more information.

1. Apply power to the terminal.
2. Press the SELF TEST button (located under the keyboard at the righthand top of the pedestal) and hold it down.
3. Press the MASTER RESET button (located next to the SELF TEST button) and release it.
4. The keyboard LED lights begin to cycle. When this happens, release the SELF TEST button.
5. The keyboard LED lights cycle twice in the course of Self Test. If there is a malfunction, the LED lights remain lit in a hexadecimal binary malfunction code. Refer to the sections describing Self Test in Volume 1 and 2 of this manual. If there is no malfunction after cycling twice, the bell sounds and the CAPS key light blinks. The cursor should appear in the upper lefthand corner of the screen.

Upon completion of steps 1 through 5, 70% of the terminal circuitry has been tested. Proper terminal operation has been verified.

CONNECTING TO A HOST COMPUTER

The Host Port RS-232 Cable may be connected to the host computer in three ways that largely depend on the distance between the terminal and the host computer. In the first way, the cable may be plugged directly into the host computer (although usually an asynchronous modem eliminator is needed). In the second way, the cable may be plugged into a "short haul" modem or line driver device. is used when the host computer is in the same building or building complex, but not in the same room or immediate area. The third way uses a telephone line connection between modems.

TELEPHONE LINE CONNECTION

A modulator-demodulator (modem) is required to establish a telephone line connection. There are a number of specialized modems available. The type required depends upon the specific needs of the installation.

A host port RS-232 cable is included with the 4114 as a standard accessory. To connect to a modem, connect one end of the RS-232 cable to the plug on the rear of the 4114 designated "To Modem". Connect the other end of the cable to the modem to be used.

INSTALLATION

Once the terminal is connected to the modem, a standard procedure for connecting to the computer is as follows (this procedure may vary in some details for different computer installations):

1. Power-up the equipment.
2. Dial the number of the computer installation.

3. When the computer responds with an audible tone, place the telephone headset on the cradle provided in the modem, or push the button marked DATA and hang up the headset, or perform such other function as required by the modem in use.
4. Perform the sign-on procedure as required by the particular computer installation.

TESTING COMMUNICATION

Once the terminal has been connected to the computer (in any of the three basic ways using the RS-232 cable), perform the sign-on ("log-in", "log-on") procedure that is required by the host computer. Once the user has "signed-on" to the system, the communication lines between the host computer and the terminal should now be open. The user can now "talk"

to the computer. The user should try a few of the basic system commands to ensure that no communication problems exist between the terminal and the host computer.

Testing the communication provides the final verification of proper operation. The 4114 is now ready for use.

PACKAGING FOR SHIPMENT

If this terminal is to be shipped long distances by commercial transportation, it is recommended that the terminal be packaged as originally received from the factory. Cartons and packaging material in which the terminal components were shipped should be saved for this purpose.

Also, if this terminal is to be shipped to a Tektronix Service Center for service or repair, attach a tag to the terminal showing the following: Owner of the terminal (with address), the name of a person at your firm who can be contacted, complete terminal type and serial number, and an explanation of the service required.

Packaging configuration illustrations are listed in Table 2-1. Refer to them when repackaging for shipment.

Table 2-1

Section 3

STRAP INFORMATION

INTRODUCTION

The terminal has straps on the various circuit boards, which provide flexibility in its operating parameters. There are two kinds of straps: cut straps and jumper straps. In cases where the terminal was designed to function one way, but provisions were made for future design enhancements, cut straps are often used. Cut straps are also used for straps that are changed

infrequently. Jumper straps, however, are changed much more often than cut straps. Most straps in the terminal are jumper straps.

This summary gives the strap settings for each standard circuit board or module in the terminal.

STRAP INFORMATION

PEDESTAL INVERTER BOARD

The jumper straps J61 and J62 select either 230 Vac or 115 Vac. See Figure 3-1. The power supply line voltage input is factory set for 115 Vac.

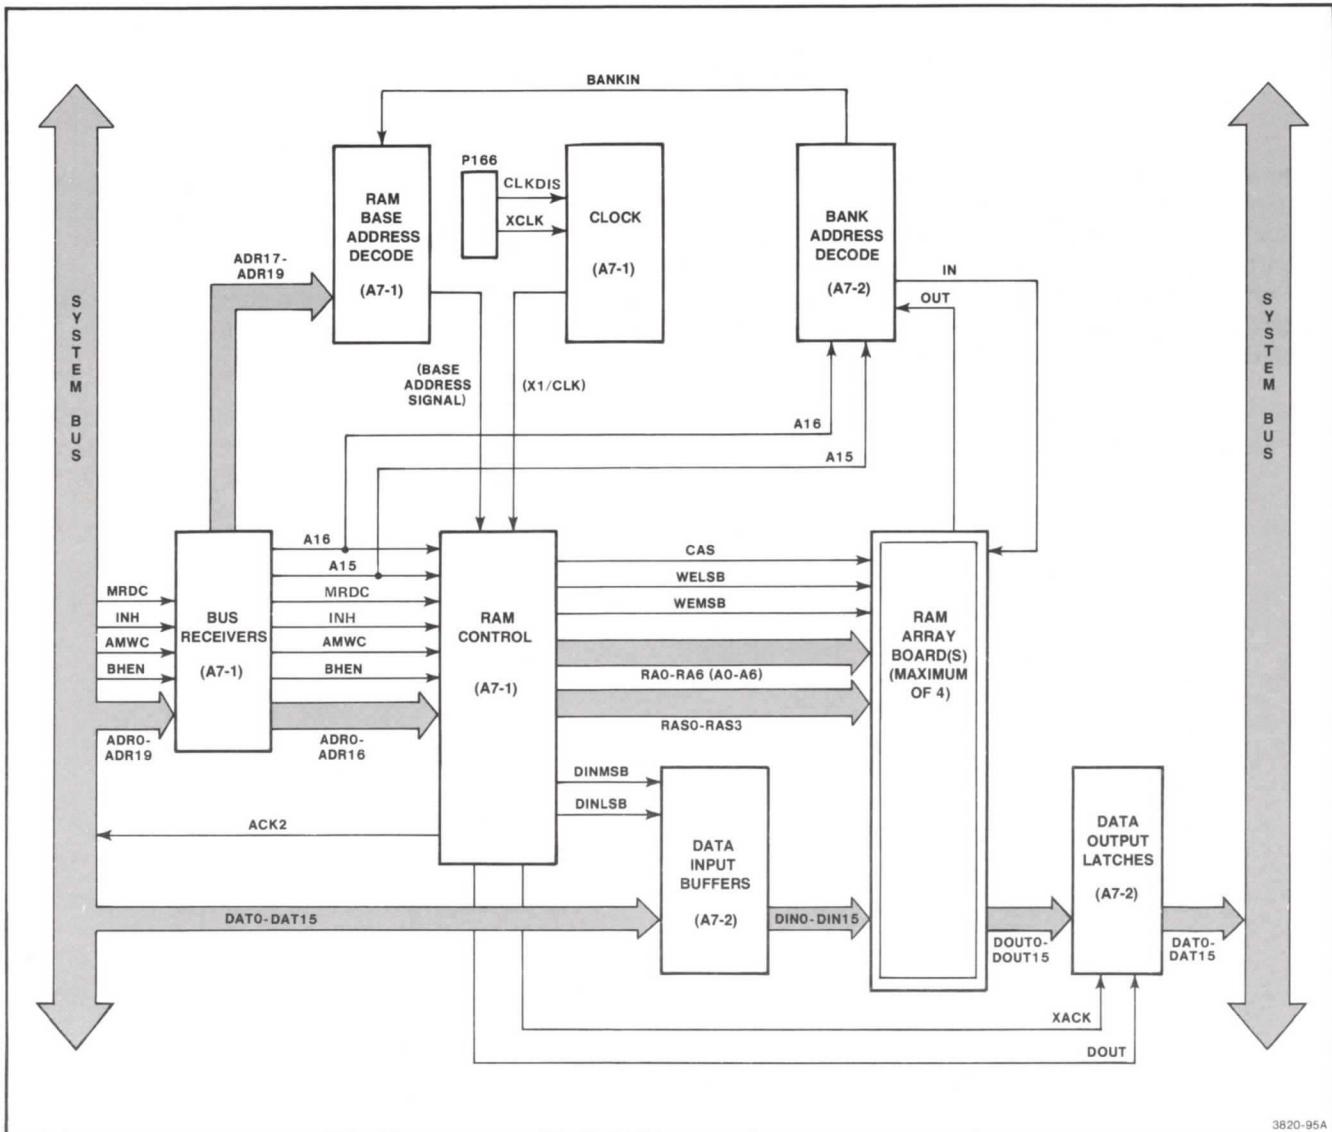

Figure 3-1. Power Supply Inverter Board; AC Input Jumper in 115 Vac Position.

PROCESSOR BOARD STRAPS

Several cut and jumper straps are provided on the Processor board. Straps labeled "Jxxx" have square pins with movable jumpers. Straps labeled "Wxxx" are cut straps; they consist of circuit traces on layer 1 of the ECB with no square pins. Table 3-1 lists these strap settings.

Table 3-1
PROCESSOR BOARD STRAP SETTINGS

Strap Label	Definition
ROM Logic Straps:	
ROM Size Strap (W126)	Selects either 16K bit or 32K bit ROMs, or disable all Processor board ROMs.
ROM Wait States (W475)	Normally strapped for ONE wait state. If all the ROMs on the Processor board are fast enough, this strap may be changed to indicate ZERO wait states.
ROM Type Straps (J226, J326, J426, J427)	There is one set of straps for each two-ROM bank of ROMs. These straps configure the board for the pin-out of the ROM being used.
BLCK Source: (W455, W456)	Normally strapped to "on-board." If more than one Processor board is used in the system, only one should be strapped to "on-board;" all others should be strapped to "off-board."
Interrupt Level Straps: (W470)	The Processor can generate three different interrupts to the 8086 bus. These straps define the interrupt priority levels of the three different interrupts. Normally, the "host port receiver interrupts" are set to interrupt level 0, "keyboard interrupts" set to level 4, and "host port transmitter" are set to interrupt level 5.
Bus Timeout Enable: (W561)	Prevents the Processor board from driving ACK1-0 on a bus timeout. Used for multi-Processor board systems.
Test 1 and Test 2 (J150 and J125)	Tests 1 and 2 disable clocks on the Processor board for ATE (automated test equipment) testing.
RS-232-C/RS-232-A: (J522)	This is normally set for RS-232-C. When restrapped for RS-232-A, the SRTS (Secondary Request To Send) signal is sent to Pin 11 of the 25-pin RS-232 connector rather than to Pin 19.

KEYBOARD STRAPS

The Keyboard cut straps allow the firmware to interpret key strokes according to languages other than English. This set consists of four individual cut straps labeled E1 through E4 (labeled W1-W4 on schematic A4-1). The combinations of these straps are read as one hexadecimal number which corresponds to certain keyboard options. See Table 3-2.

**Table 3-2
KEYBOARD LANGUAGE OPTION STRAPS**

Language	Option Number	Open Cut Strap	Hex Code
Standard	—	none	00
United Kingdom	4A	E4	08
Swedish	4C	E2	02
APL	4E	E1	01
Danish/Norwegian	4F	E2 & E3	06

RAM/ROM AND RAM CONTROLLER BOARD STRAPS

To install optional RAM memory, one or more RAM Controller boards must be installed in the card cage. Each RAM Controller board has sockets for four RAM Array boards. The RAM Array boards contain 32K-byte banks of memory. Since six RAM Controller boards can be installed in the terminal, it is necessary to specify the starting address of the four RAM banks on each RAM Controller board.

Strap J165 (see Figure 3-2) sets the Base Address for all memory on the board. Set the strap to '1,' for the RAM Controller nearest the processor. Set the strap on the other RAM Controller boards to "2", "3", "4", etc., as they are placed in order farther away from the Processor board. Strap J165 allows strapping for a maximum of six RAM Controller boards.

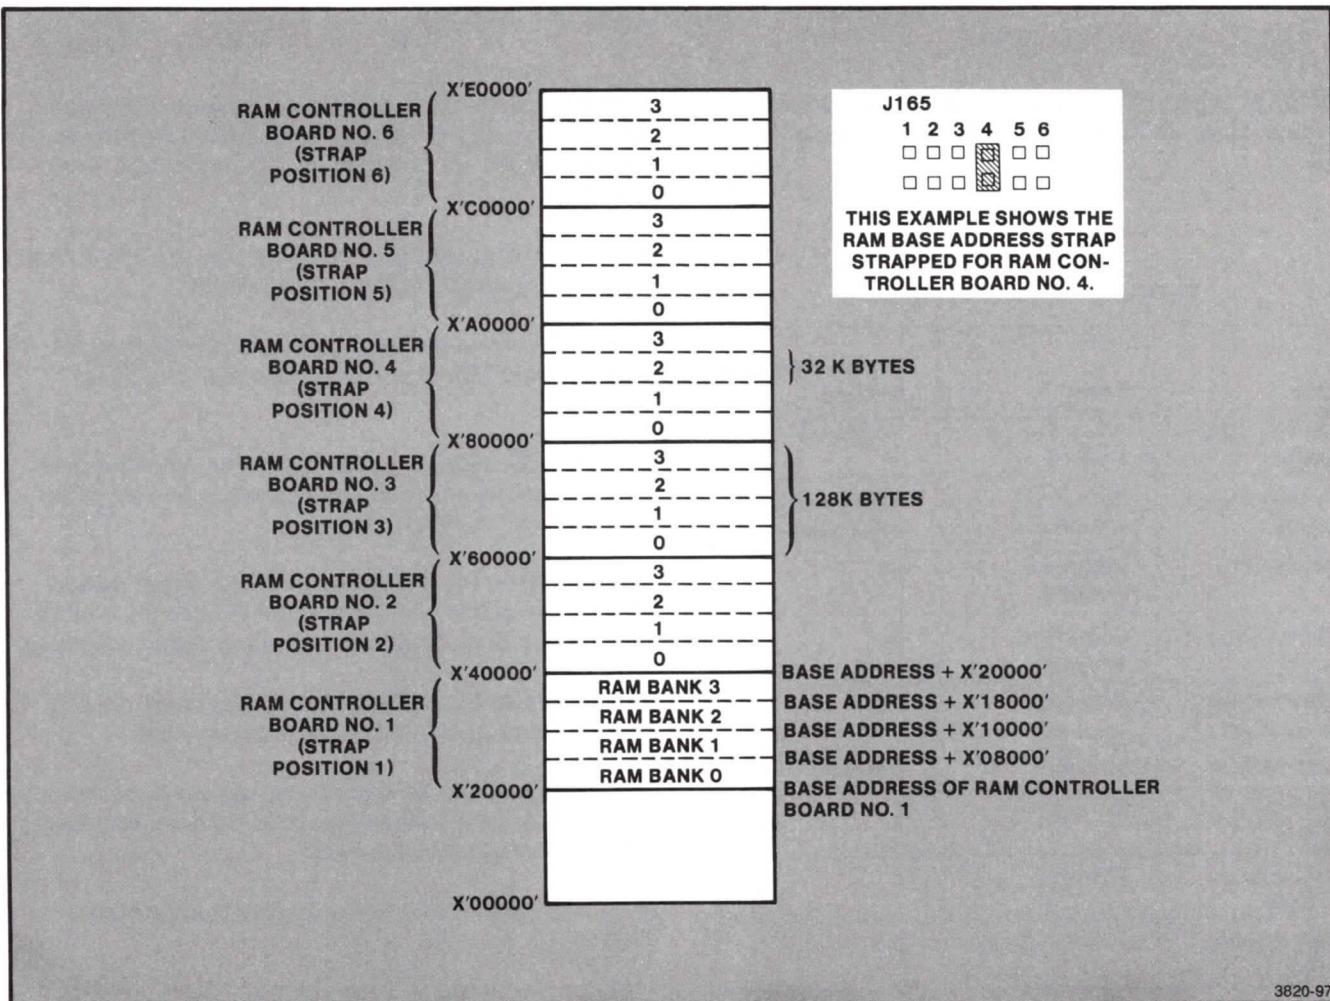

Figure 3-2. RAM Controller Board Base Address Strap Positions.

DISPLAY MODULE STRAPS

There are eight strap options in the terminal display module. They are located on the boards listed in Table 3-3.

Table 3-3
DISPLAY MODULE STRAPS

Strap	Board	Normal Operating Setting
100, 120, 220, 240Vac	Power Supply Module	Selectable
X-Y Interchange Polarity	Deflection Amplifier	Varies with crt configuration
Hold IN/OUT	Deflection Amplifier	IN
Antiburn IN/OUT	Deflection Amplifier	IN
SLU-0 recovery time FAST/SLO	Deflection Amplifier	FAST
Erase TEST/N	Storage	N (normal)
View Reset Z/TRUZ	Storage	Z
View Reset Z/GBUSY	Storage	Z
Z Axis Polarity Z1/Z-0	HV & Z Axis	Z-0

Five of the eight strap options are used to match the operational requirements of the pedestal. These are preset and are not changed during normal use. They are:

- Z Axis input polarity on the High Voltage and Z Axis board for selecting the Z-Axis polarity.
- View Reset on the Storage board for selecting the signal line TRU-Z or GB to reset the View Timer Control.
- Hold mode control on the Deflection Amplifier board for selecting between active and inactive Amplifier inputs during Hold mode.
- Antiburn on the Deflection Amplifier board selects between active and inactive beam intensity control during periods of little or no writing beam movement.
- Fast/Slo on the Deflection Amplifier board selects between SLU-0 fast or slow recovery time.

The factory setting for each of the options is as follows: Z-Axis Polarity, Z-0; View Reset, Z; Hold, IN; Antiburn, IN; SLU-0 recovery time, FAST.

A detailed description of the display module straps follows.

X AND Y INPUT INTERCHANGE (Deflection Amplifier Board)

These straps are used when the crt needs to be rotated 180 degrees due to aging crt phosphors. See "Rotating the CRT 180 degrees" in Section 11, Vol. 1 (Maintenance). Altering these straps interchanges the $\pm X$ and $\pm Y$ deflection inputs, which causes the crt to write in a different direction. The normal writing pattern is from left to right across the screen, and from top to bottom down the screen.

SELECTING HOLD IN/OUT (Deflection Amplifier Board)

This strap connects the deflection inputs while in Hold mode either to ground or to the Deflection Amplifier board input connectors. In the IN position, when the display enters Hold mode, the deflection inputs are connected to ground. This centers the deflection amplifier again and minimizes the amplifier power dissipation. In the OUT position, when the display enters Hold mode, the deflection inputs remain directly connected to the deflection amplifier input connectors.

SELECTING ANTIBURN IN/OUT (Deflection Amplifier Board)

This strap is always factory preset to the IN position. To avoid possible crt damage, it should not be set to the OUT position except for the adjustment of the display module.

Antiburn protects the crt from slow-moving, high-intensity beams. In the IN position, the antiburn amplifier controls the beam intensity. In the OUT position, there is no antiburn control and a slow-moving, high-intensity beam may damage the crt.

SELECTING FAST/SLO (Deflection Amplifier Board)

This strap option is used for a setting of SLU fast or slow recovery time. In the FAST position, the SLU signal provides only enough time for the settling of the deflection amplifier. In the SLO position, the SLU time is increased which provides additional settling time.

The display module is designed to be compatible with the pedestal with the FAST/SLO signal set in the FAST position. THIS SETTING SHOULD NOT BE CHANGED.

SELECTING N/TEST (Storage Board)

This strap is used only during display adjustment and should be left in the N position for normal operation. TEST will cause the crt to erase approximately every three seconds.

SELECTING Z RESET SELECT (Storage Board)

This strap selects the TRU-Z signal or a transition signal on the GBUSY signal line (GB) to reset the view counter. Resetting the view counter prevents the display module from going into Hold mode and ultimately into Auto Erase mode. In the TRU-Z position, each Z Axis positive transition resets the view counter, while in the GB position, any positive transition (from either a positive or negative pulse) of the GBUSY-0 signal line resets the view counter. An additional signal line, VIEW-0, also controls the view counter. A low on the VIEW-0 signal line always resets the view counter.

SELECTING Z AXIS INPUT POLARITY (HV & Z Axis Board)

The display module uses a factory setting of Z-0 in order to be compatible with the pedestal. THIS SETTING SHOULD NOT BE CHANGED.

The display module is designed to accept either a low or high true TTL signal. To accomplish this, a set of two straps — labeled Z-1 and Z-0 — on the High Voltage and Z Axis board is set to select which true level of Z is used by the display control. If a low true TTL signal is used for Z, the two straps must be set in the Z-0 position. The writing beam is then turned off when the Z Axis input signal rises to at least + 2 V, and turns on with a signal of less than + 0.8 V. Conversely, if a high true TTL signal is used for Z, the two straps must be set in the Z-1 position. The writing beam is then turned on when the Z Axis input signal rises to at least + 2 V, and turns off with a signal of less than + .8 V.

SELECTING LINE OPERATING VOLTAGE

If it is necessary to change the transformer terminal connections to conform to your line voltage range, use the following procedure:

1. Remove the cover plate protecting the power transformer, the input power assembly, and the line fuse.
2. Connect or change the straps on the five-terminal barrier strip to conform to the desired line voltage using the illustration in Figure 3-3 as a guide.
3. Change the fuse, if necessary, to conform to the new operating voltage. The fuse information is shown on the rear of the chassis and repeated in Table 3-4.

4. Replace the cover plate over the Power Input Voltage Selection strip.
5. Change the yellow voltage indicator on the rear panel to indicate the new input line (primary) voltage.

Table 3-4

FUSE SELECTION

Line	Fuse Rating
100 V	5 A SLOW-BLOW
120 V	5 A SLOW-BLOW
220 V	3 A SLOW-BLOW
240 V	3 A SLOW-BLOW

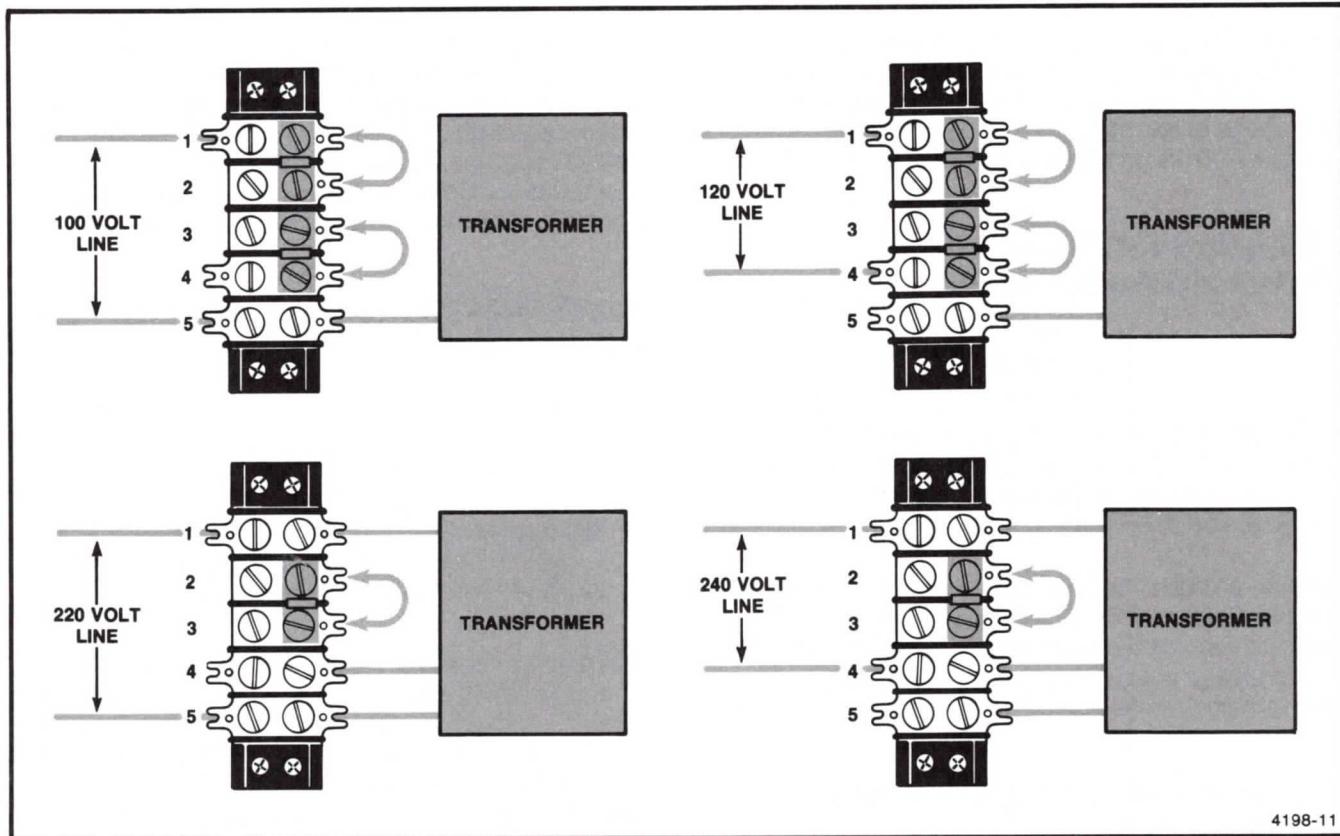

Figure 3-3. Five Terminal Barrier Strip Wiring and Jumper Positions for Line Voltage Selection.

VECTOR GENERATOR BOARD STRAPS

There is only one strap on the Vector Generator board. This is strap J601, which overrides the charge pump

for troubleshooting purposes. The Vector Generator board has no jumper strap on J601 during normal use.

DISPLAY CONTROLLER BOARD STRAPS

The Display Controller board has two cut straps on it, W370 and W570.

W570 selects one of seven bus interrupt levels, 0 through 7. The factory setting is wired to the 6 position.

W370 has two possible positions that select for address decoding. The positions are 0 and 1. The 0 position selects addresses X'00D0' through X'00D7' for decoding, while the 1 position selects addresses X'00D8' through X'00DF' for decoding. The factory preset position is 0.

Section 4

ABBREVIATED ADJUSTMENT

INTRODUCTION

This section is divided into two subsections, the first subsection describes the adjustment procedures for the pedestal part of the terminal. The second subsection describes the terminal display module adjustment procedure.

NOTE

This abbreviated adjustment section should NOT be used as a complete adjustment procedure. It does, however, serve as a checklist for the experienced service technician. For the complete adjustment procedures refer to "Pedestal Adjustment Procedure" and "Display Module Adjustment Procedure" in Volume 1 of this manual. THIS ABBREVIATED ADJUSTMENT SECTION DOES NOT CONTAIN "NOTES," "CAUTIONS," OR "WARNINGS."

PEDESTAL ADJUSTMENT

Gather the equipment necessary for adjusting the terminal, make sure the terminal is operating under performance specifications, remove the pedestal front panel, and perform an inspection with the power off.

1. LOW VOLTAGE POWER SUPPLY (R685)

- a. Install the 41XX Logic Extender board. (This board contains the test points needed for the power supply checks).
- b. CHECK — TP 75 on the Logic Extender board for + 5.105 V to + 5.115 V.

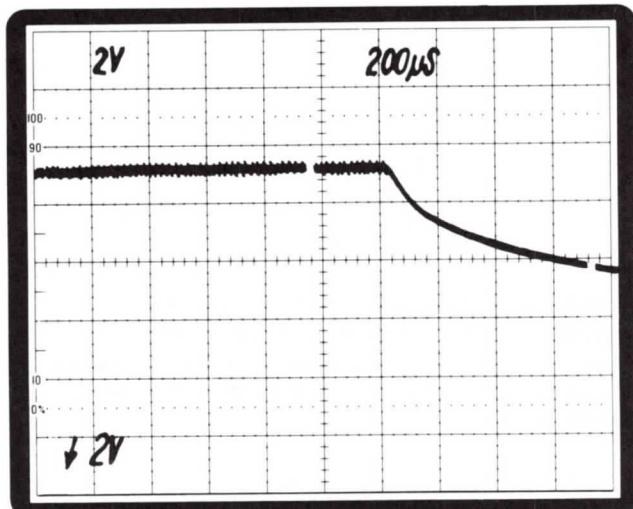

- c. ADJUST — + 5 V (R685) for + 5.1 V at TP 75.
- d. CHECK — the + 12.00 V supply at TP 79 for + 11.88 V to + 12.12 V.
- e. CHECK — the -5.2 V supply at TP 5 for -5.05 V to -5.35 V.
- f. CHECK — the -12.00 V supply at TP 1 for -11.88 V to -12.12 V.
- g. CHECK — power supply ripple on the + 5.1, + 12.00, -12.00, and the -5.2 V supplies is 100 mV or less.

ABBREVIATED ADJUSTMENT

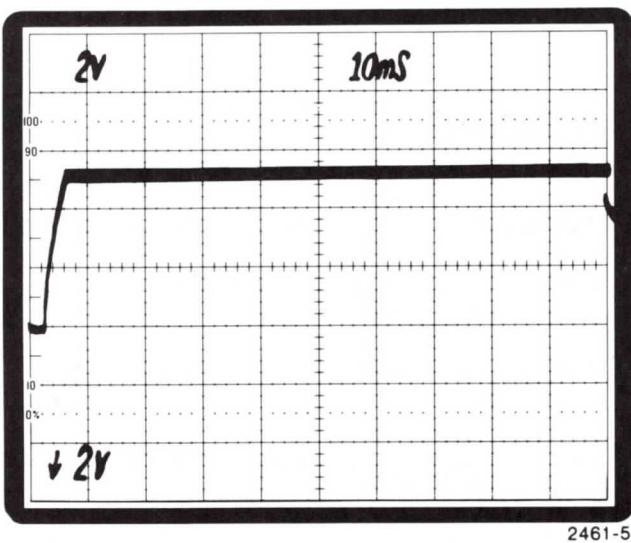

- h. CHECK — the INIT waveform at TP9 and the PDWN-INIT waveform at TP 75 during the power up and power down sequences. Refer to Figures 4-1 and 4-2.
- i. CHECK — the PFAIL waveform at TP 7. Refer to Figure 4-3.

2. VECTOR CLOSURE (R1,R3)

- a. Display the Status message on the screen.
- b. ADJUST — R1 and R3 for maximum vector closure using the letter "B" in the status message. See the Adjustment foldout for the location of R1 and R3.

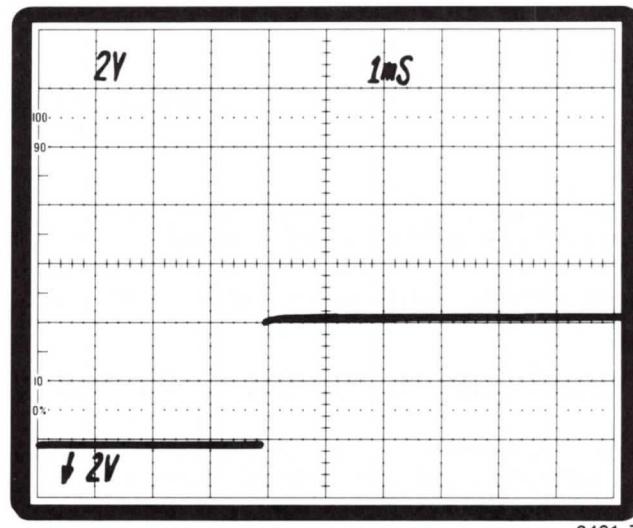

2461-6

2461-5

Figure 4-1. INIT Waveform.

2461-7

Figure 4-3. PFAIL Waveform.

3. VECTOR GENERATOR BOARD (R424, R425,R426,R427,R605,R704)

- a. Install the Vector Generator board on the 41XX Logic Extender board.
- b. ADJUST — R425 (X DAC offset) for -4.950 V at TP 706 with the writing beam positioned to 0,0.
- c. ADJUST — R426 (Y DAC offset) for -4.873 V at TP 716 with the writing beam at 0,0.
- d. ADJUST — R424 (X DAC gain) for $+4.950$ V at TP 706 with the writing beam at 1023,4095.

- e. Adjust — R427 (Y DAC gain) for $+4.873$ V at TP 716 with the writing beam at 1023,4095.
- f. CHECK — the values in steps 2, 3, 4, and 5 again for any changes.
- g. ADJUST — R605 (Pump Up/Down) and R704 (Pump Down)for the best waveform at TP502 and TP 525 (externally triggered) while obtaining an optimum charge pump pattern on the display. See Figures 4-4 and 4-5.
- h. Turn off the terminal, remove the test board, install the Vector Generator board again, and replace the pedestal cover.

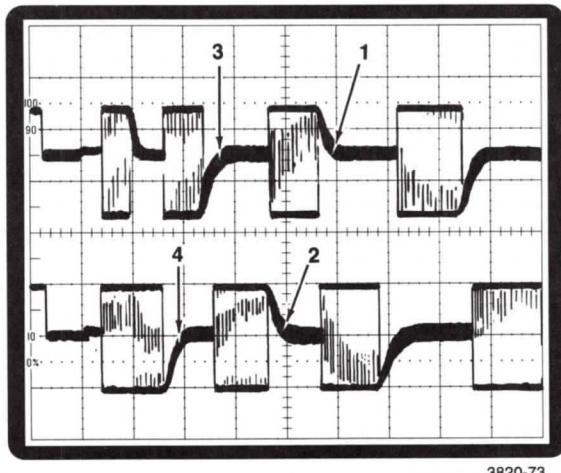

Figure 4-4. Charge Pump Waveform.

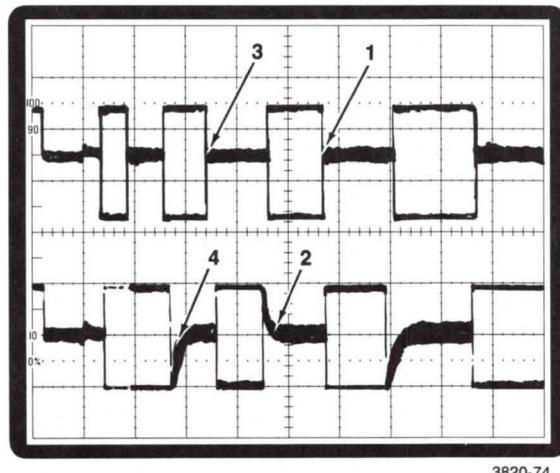

Figure 4-5. Adjusted Charge Pump Waveform.

DISPLAY ADJUSTMENT

Gather the equipment necessary for adjusting the terminal, make sure the terminal is operating under performance specifications, remove the pedestal front panel, and do an inspection with the power off.

1. LOW VOLTAGE POWER SUPPLY (R166)

- a. Turn on the terminal and press the PAGE key.
- b. CHECK — for voltage tolerances and ripple in Table 4-1 measured on the Interconnect board.
- c. ADJUST — R166 (+ 15 Adj) on the LVPS board for + 14.95 V to + 15.03 V.

Table 4-1

LVPS VOLTAGE TOLERANCES AND RIPPLE

Voltage	Voltage Tolerance	Maximum Ripple
+ 15 V (reg)	+ 14.97 V to + 15.03 V	5 mV p-p
- 15 V (reg)	- 14.85 V to - 15.15 V	5 mV p-p
+ 5 V (reg)	+ 4.8 V to + 5.2 V	10 mV p-p
+ 12 V (unreg)	no tolerance (about + 9 V)	1.5 V p-p
- 12 V (unreg)	no tolerance (about - 9 V)	1.5 V p-p
+ 20 V (unreg)	no tolerance	1.2 V p-p
- 20 V (unreg)	no tolerance	1.2 V p-p
+ 175 V (unreg)	no tolerance	7.0 V p-p
+ 290 V (reg)	+ 287.0 V to + 293.0 V	100 mV p-p
+ 490 V (unreg)	no tolerance	5.0 V p-p

2. HIGH VOLTAGE CHECK

- a. Check pin 3 of the crt for - 5700 V to - 6300 V at 120 Vac. It should not vary more than + , - 60 V at 108 Vac and 132 Vac.

3. STORAGE BOARD (R197,R198,R295)

- a. CHECK — TP 91 for 142.5 V to 157.5 V.
- b. ADJUST — R295 (OP LEVEL) so that the crt gets bright but does not store. Check the OP LEVEL voltage at TP 94.
- c. ADJUST — R198 (CE-2) for a flood gun pattern 1/16 inch from the edge of the phosphor. Check the CE-2 voltage at TP 93.
- d. ADJUST — R197 (CE-1) for uniform background illumination. The CE1 voltage at TP 92 should be about 5 V higher than CE-1. Make sure that oscillation does not occur due to the interaction between R197 and R198.
- e. Place the DVM probe on TP 91 and press PAGE. The voltage should not change during erasure.

4. STORAGE BOARD ERASE WAVEFORMS (R95,R195)

- a. Turn the power off, change the N/TEST jumper to "TEST", and turn the power back on. Note that the screen erases every 3 seconds.
- b. CHECK — for the Figure 4-6 waveform at TP 94, and verify that its parts conform to the waveforms in Figures 4-7 AND 4-8.

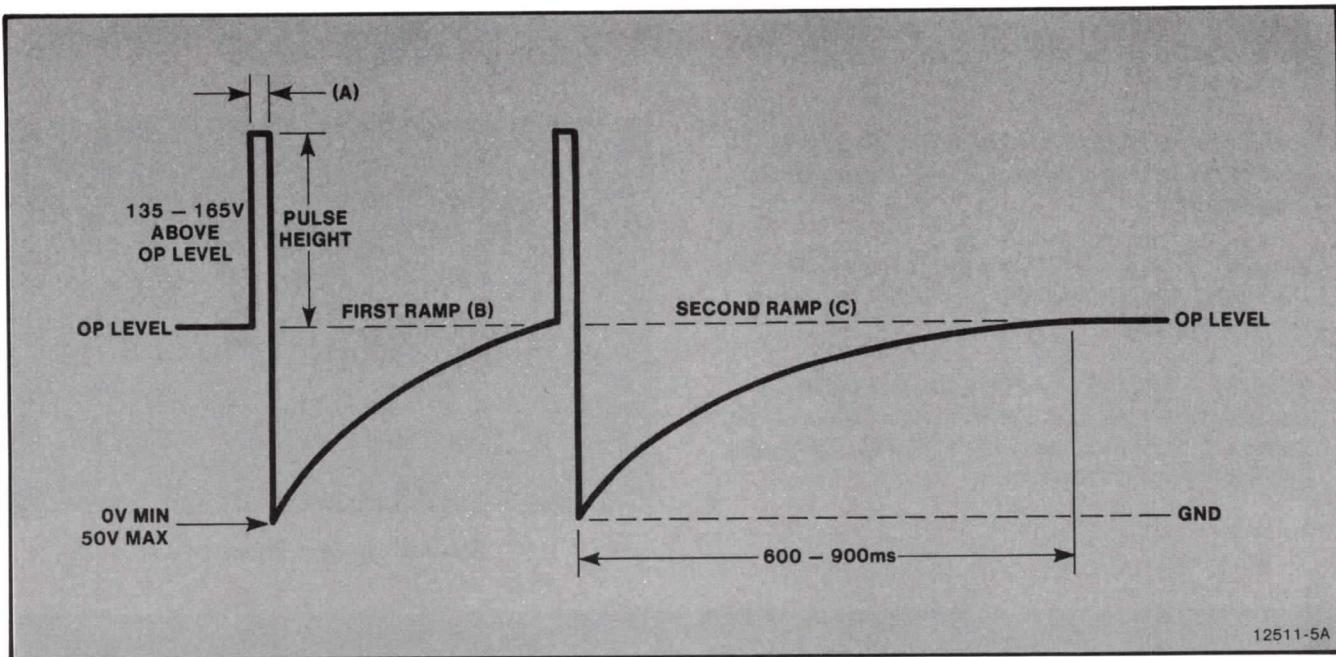

Figure 4-6. Target Erase Waveform.

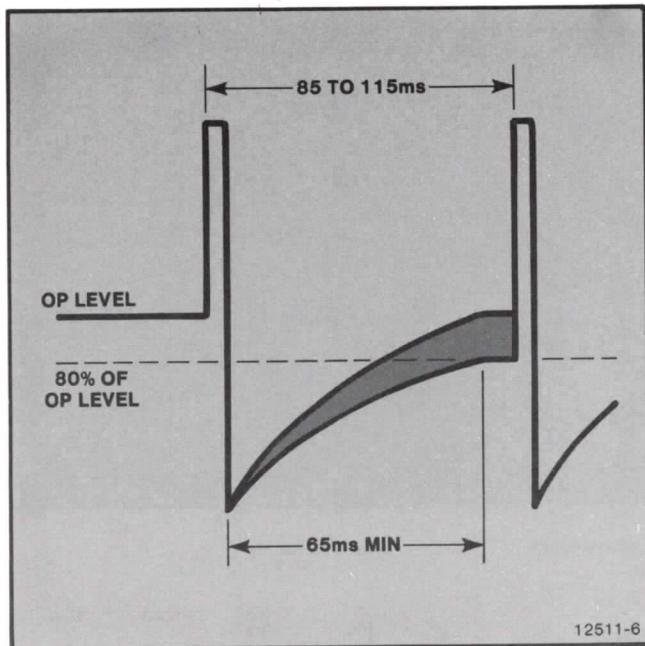

Figure 4-7. Target Erase Waveform Enlarged.

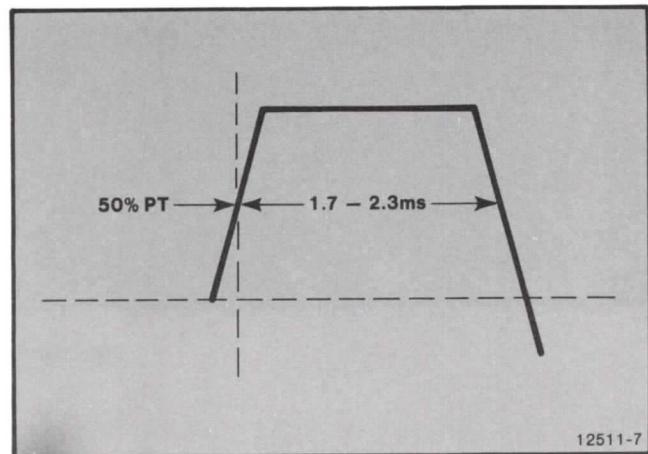

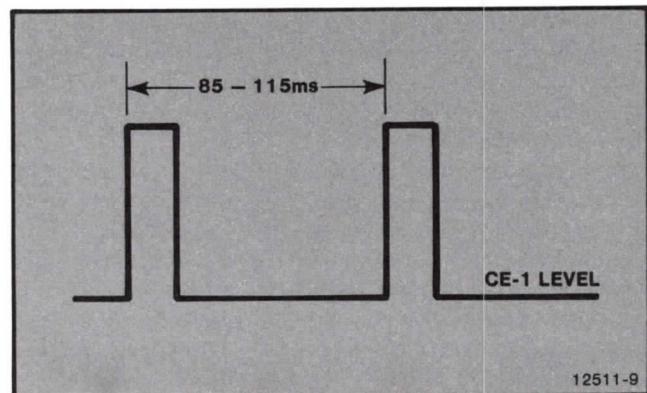

Figure 4-8. Target Erase Pulse Waveform.

ABBREVIATED ADJUSTMENT

- c. CHECK — for the CE-2 waveform at TP 93 and verify that its shape conforms to the waveform in Figure 4-9.
- d. CHECK — for the CE-1 waveform at TP 92 and verify that its shape conforms to the waveform in Figure 4-10.
- e. ADJUST — R95 (CE-1 Pulse Control) while erasing the screen and observing the edges of the screen for full coverage.
- f. ADJUST — R195 (CE-2 Pulse Control) while erasing the screen and observing the edges of the screen for full coverage. The OP LEVEL, CE-1, and CE-2 adjustments interact.

- g. Turn the power off, change the N/TEST jumper to "N", and turn the power back on.

12511-9

Figure 4-10. CE-1 Waveform.

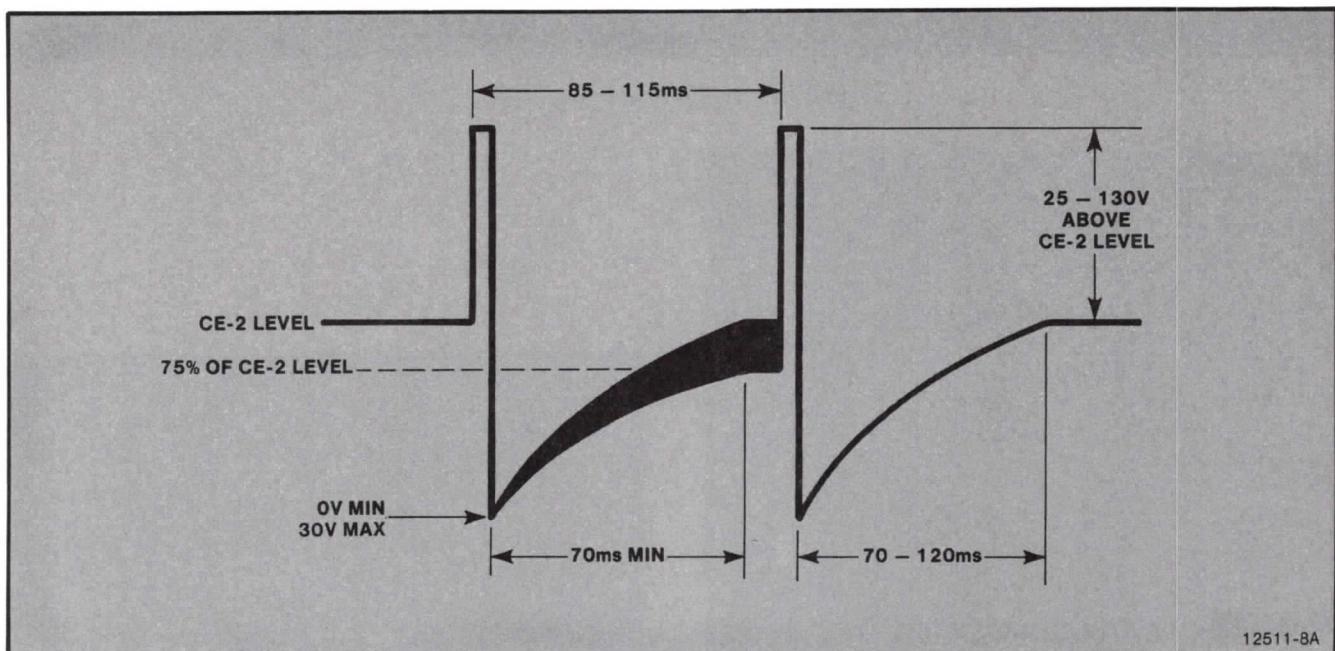

Figure 4-9. CE-2 Waveform.

5. FLOOD GUN ANODE

- a. Press the PAGE key and make sure that Hold mode lasts for 90 to 135 seconds.
- b. CHECK — for the waveform in Figure 4-11 at TP 91 on the Storage board while the terminal is in Hold mode.
- c. CHECK — for a TTL low on Pin 43 of the Interconnect board while the terminal is in Hold mode.

6. GRID BIAS (R288,R429)

- a. Turn the power off, move the antiburn strap from "IN" to "OUT", and turn the power back on.
- b. ADJUST — R429 (CRT BIAS on the HV & Z Axis board) clockwise until a low intensity dot appears in one corner of the cursor. Retrace lines also appear around the cursor. Adjust R288 (CENTER FOCUS on the HV & Z Axis board) for a well-focussed dot, then adjust R429 until the dot just disappears.
- c. CHECK — the voltage at the junction of C436 and CR345 on the HV & Z Axis board.
- d. ADJUST — R429 counterclockwise to increase the measurement to 5 volts.
- e. Turn the power off, move the antiburn strap from "OUT" to "IN", and turn the power back on.

7. NORMAL INTENSITY (R427)

- a. Press and hold down a character key and observe the Figure 4-12 waveform at the top of R246 on the HV & Z Axis board.
- b. ADJUST — R427 for a 40 V to 50 V difference between the most positive points ("crests") of adjacent pulses.

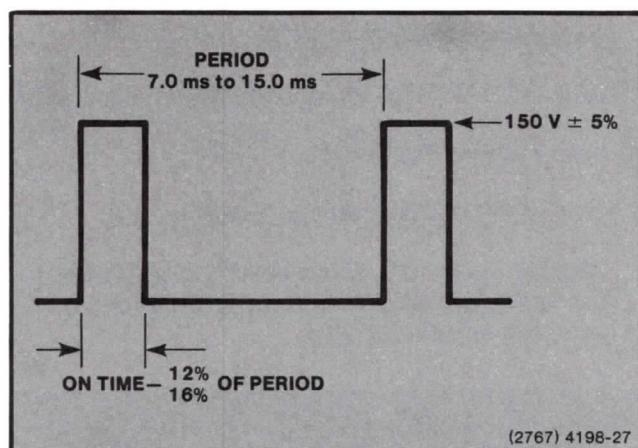

Figure 4-11. Flood Gun Anode Waveform.

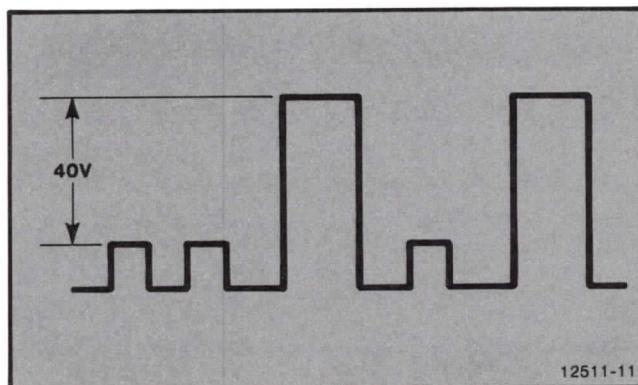

Figure 4-12. Waveform at R246.

8. ORIGIN SHIFT

- a. Press the PAGE key eight times and watch for seven consecutive origin shifts, with the cursor returning to the upper right on the eighth.

9. FREQUENCY COMPENSATION (R51, R69,R167)

- a. Display the X COMP pattern (key F3) by using the Self Test procedure.
- b. ADJUST — R51 (LA Short) and R150 (LA Long) on the Deflection board so that only one line can be seen. Refer to Figure 4-13.
- c. Display the Y COMP pattern (key F4).
- d. ADJUST — R69 (SA Short) and R167 (SA Long) on the Deflection board so that only one line can be seen. Refer to Figure 4-13.

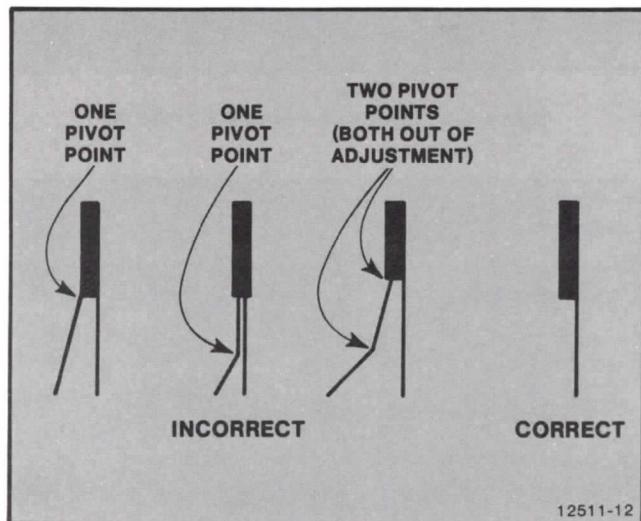

Figure 4-13. X and Y Axis Frequency Compensation Adjustments.

10. GAINS, POSITIONING, AND GEOMETRY (R50,R67,R250,R267, R322,R326)

- a. Display the GAIN pattern (key F2) by using the Self Test procedure.
- b. ADJUST — the yoke for a straight, vertical line in the middle of the pattern.
- c. ADJUST — R250 (Long Axis Pos) and R267 (Long Axis Gain) on the Deflection Amplifier board so that the left and right vertical line midpoints and the top and bottom horizontal line midpoints are equidistant from the edges of the crt.
- d. ADJUST — R267 (SA Pos) and R67 (SA Gain) so that the midpoint of the top and bottom horizontal lines are the same distance from the top and bottom of the crt screen (or crt filter).
- e. ADJUST — R326 (LA Geo) on the Deflection Amplifier board for the straightest top line.
- f. Measure the straightness of the bottom horizontal line.
- g. ADJUST — R322 (SA Geo) on the Deflection Amplifier board for the straightest lefthand vertical line.
- h. Measure the straightness of the righthand vertical line.
- i. CHECK — for excessive deviation from an ideal, straight line in the top horizontal line. If there is none, tighten the yoke.

11. ORTHOGONALITY

- a. Check for no more than + 1.2 degrees deviation from -90 degrees where the lines cross in the middle of the screen.

12. DYNAMIC FOCUS (R424)

- Display the GAIN pattern (key F2).
- Attach the oscilloscope probe to the upper end of R235 in the center of the HV & Z Axis board.
- ADJUST — R424 (Focus) on the Deflection Amplifier board so that the waveform changes less than 2 V as R128 (Corner Focus) is adjusted. See Figure 4-14.

13. SLU-0

- Display the X COMP pattern.
- CHECK — for a TTL pulse at Pin 36 of the Interconnect board.

14. FOCUS (R128,R288)

- Display the FOCUS pattern.
- ADJUST — R288 (Center Focus) and R128 (Corner Focus) on HV & Z Axis board the best center and corner focus while the pattern is writing.

15. DROPOUT

- Display the HARD COPY pattern, wait 2 1/2 minutes, and then press the SHIFT key.
- Increase the OP LEVEL or NORMAL intensity adjustments in 5 V increments and repeat step a until the minimum number of breaks are seen.

16. BRITE INTENSITY AND DEFOCUS (R34,R415)

- Display the DEFOCUS pattern.
- ADJUST — R415 (Brite Intensity) on the HV & Z Axis board for 10 V higher than the NORMAL INTENSITY level. See Figure 4-15.
- ADJUST — R34 (R34) on the HV & Z Axis board for a difference in characters as they are displayed.

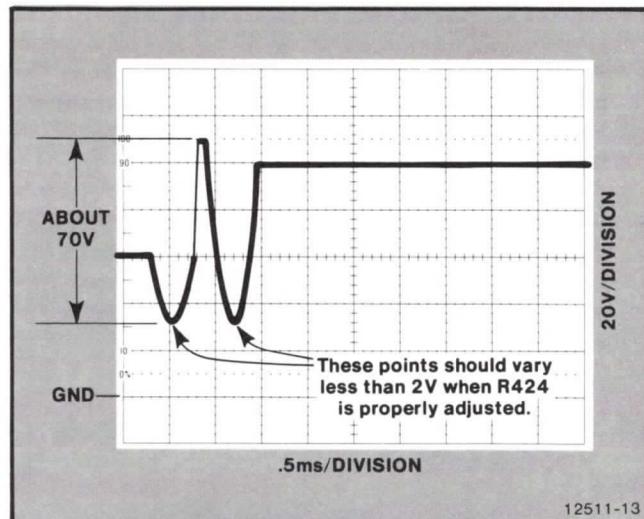

Figure 4-14. Dynamic Focus Waveform.

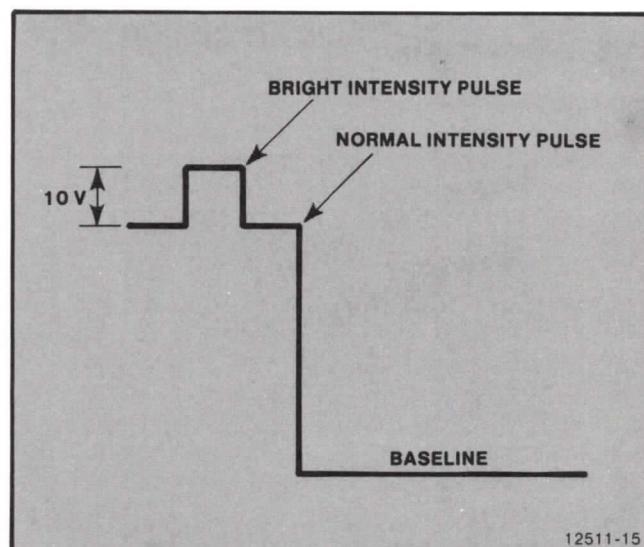

Figure 4-15. Brite Intensity Pulse.

ABBREVIATED ADJUSTMENT

17. WRITE-THRU INTENSITY (R227)

- a. Press the LOCAL key. Then press the ESC key followed by the CONTROL and Z keys at the same time. Use the thumbwheels to control the cross-hairs.
- b. ADJUST — R227 (Write-Thru Intensity) so that the lines disappear when the REFRESH INTENSITY control is fully counterclockwise and the lines store when REFRESH INTENSITY is fully clockwise.

18. HARD COPY (R26,R226,R227,R228, R229,R426)

- a. Connect a 4631 Hard Copy Unit, display the GRAPHIC pattern, press the HARD COPY key, and check for dimming of the screen during scanning.
- b. CHECK — Pin 43 on the Interconnect board during a scan for TTL low.

- c. ADJUST — R226 (Hard Copy Intensity) on the HV & Z Axis board for a non-storing, visible sweep during scanning.
- d. ADJUST — R227 (Hard Copy LA Gain), R228 (Hard Copy SA SA Gain), R229 (Hard Copy LA Pos), R426 (Hard Copy SA Pos), on the Deflection Amplifier board so that a scan covers the pattern with an additional 1/8 inch beyond each edge.
- f. ADJUST — R226 (Hard copy Intensity) for a scan just below storage level.
- g. Adjust — R26 (Hard Copy Threshold) on the HC Amplifier board for high contrast copies without noise. Compare three copies.
- h. Press PAGE, turn off the terminal, and install the cabinet cover again.

This completes the abbreviated adjustment procedures for the pedestal and display module.

Section 5

SELF-TEST DIAGNOSTIC PROGRAM

INTRODUCTION

The primary troubleshooting aid for the 4114 is the Self-Test diagnostic program. This program resides in firmware and is arranged so it checks all hardware, starting with the initial error reporting mechanism (keyboard LEDs). Self-Test does not depend on any portion of the hardware until it has tested it; it may then use such hardware to aid in other tests.

PARTS OF SELF-TEST

There are three separate parts of the Self-Test program: the main Self-Test program, Power-Up, and Adjustment Self-Test. An additional diagnostic, System Errors Detector, is not really a part of Self-Test but is described in this section also. Figure 5-1 shows how these diagnostics are related to the main Self-Test firmware.

Power-Up

A subset of Self-Test is the Power-Up sequence. This diagnostic cannot be called directly by the user, but runs automatically each time the terminal is turned on. It performs a quick check of the various hardware modules. The 4114 operator's manual describes the error messages that may appear during the Power-Up sequence. For detailed diagnostic examination of terminal hardware, use Self-Test. Self-Test will perform additional tests as well as repeating the same tests that were done during the Power-Up sequence.

Main Self-Test

The main part of Self-Test is that portion which runs when the SELF TEST and MASTER RESET buttons are pressed. This routine repeats the Power-Up sequence and then goes on to thoroughly test the entire terminal hardware, including any options that may be installed.

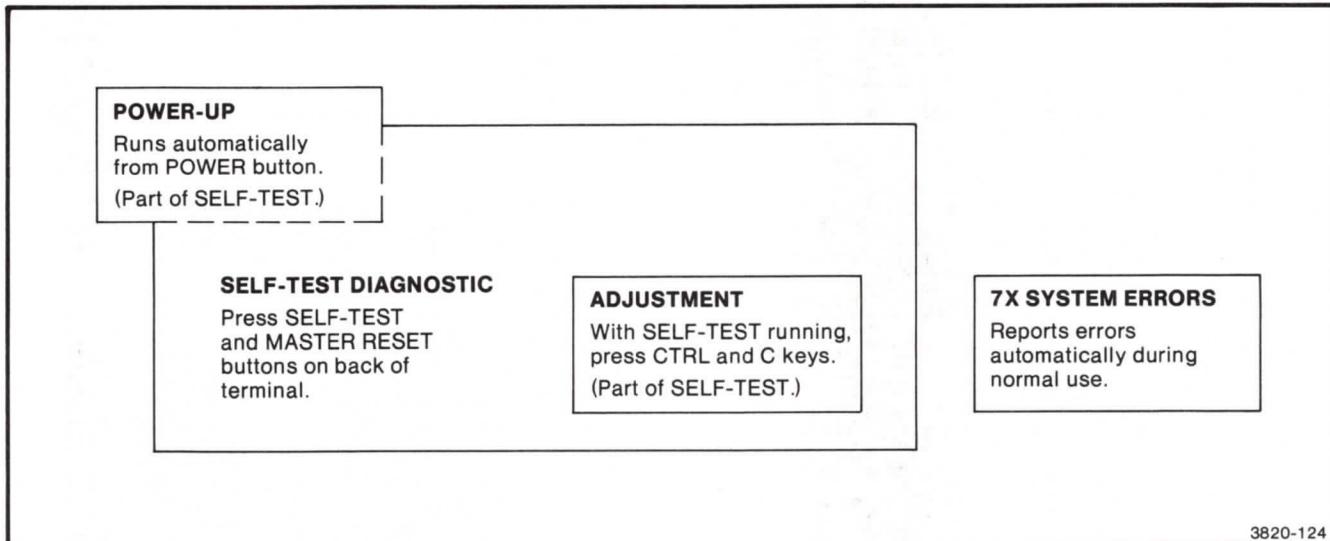

Figure 5-1. Self-Test Functional Diagram.

3820-124

Adjustment Routine

The Adjustment part of Self-Test is used primarily for making adjustments and performance checks. However, this routine may also be used as a diagnostic tool, particularly on certain options such as the 3PPI. This routine is accessed from inside Self-Test by pressing the CTRL and C keys together. Detailed instructions about this part of Self-Test are located at the end of this section.

7x System Errors Detector

This error detecting firmware contains routines that catch system level or operator induced errors at the time they occur; not just during Self-Test. These error reporting routines are in ROM and have the same general syntax as the Self-Test error messages, but this error reporting device runs separately and independent of Self-Test. This allows it to report such errors spontaneously at the time a problem appears. The error codes that come under this category are listed and described in Table 5-11. If such an error is reported, which seems to be related to a hardware malfunction, run Self-Test to verify and locate it.

CONTROL FLOW OF SELF-TEST

Figure 5-2 shows the order in which the various hardware modules are tested. The three areas "flagged" with a 0 must function for Self-Test to run. After these areas are verified as functional, the keyboard lights and keys are tested (1). Then areas 2 through 9 are tested in that order.

Figure 5-7 (on the pull-out at the end of this section) shows the logical flow of Self-Test. This is the order in which the diagnostic checks are made when Self-Test is initialized. This figure does not include any submessages.

A subset of Self-Test is the Power-Up sequence. This sequence checks approximately 60% of the 4114 circuitry and is performed every time that the 4114 is turned on.

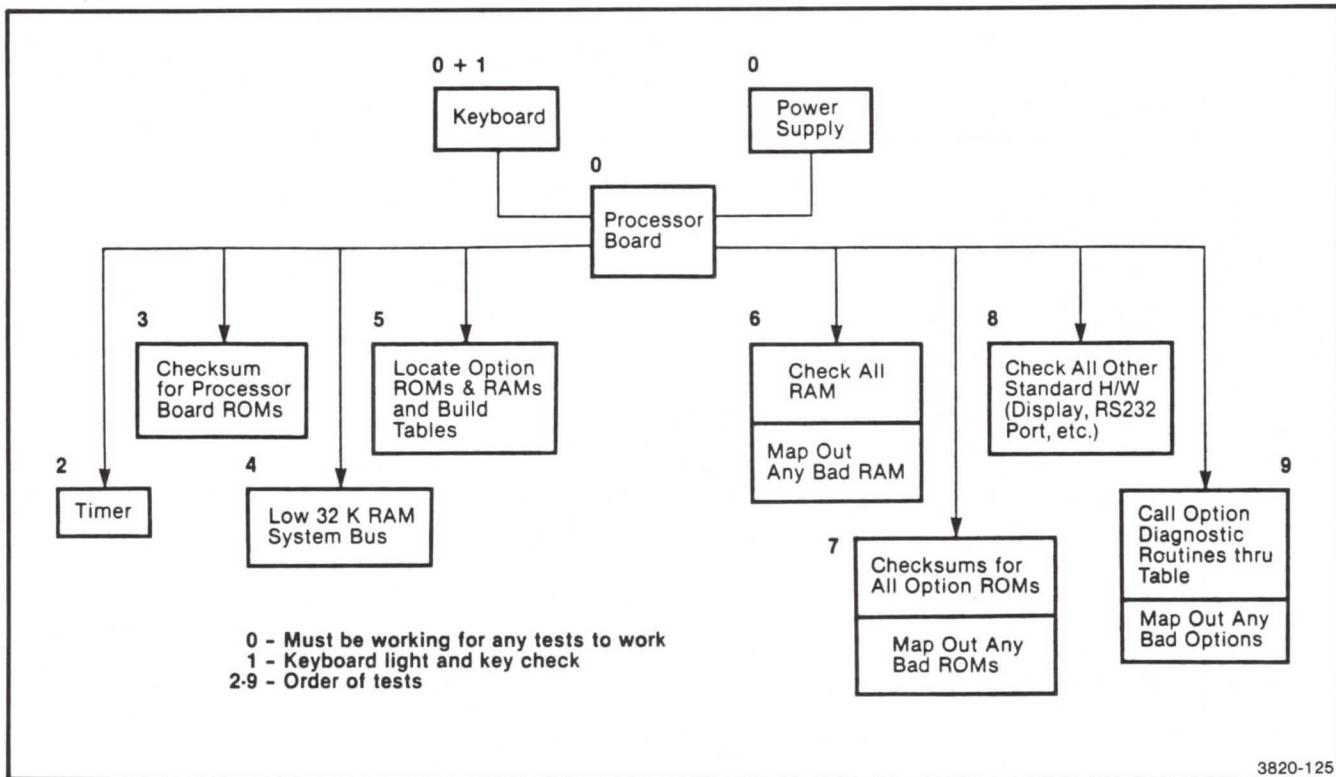

Figure 5-2. Self-Test Program Block Diagram.

In Table 5-1, the diagnostic checks that are performed during the Power Up routine are marked by the letters PUP. When the full version of Self-Test is run, all the tests are performed, including a repeat of the Power Up checks. This table contains only the tests executed by a standard 4114 terminal. The firmware used to check the options (such as the disk drive or Tablet Interface board) are contained on those optional boards.

NOTE

The light codes FD (1111 1101), CF (1100 1111), and BB (1011 1011) are not found in this table even though they are listed in the tables following. These codes are not tested in Self-Test, but are generated as error messages by the routine only if an error is found during the tests. For a definition of these codes, see the tables following Table 5-1.

Table 5-1
POWER-UP/SELF-TEST SEQUENCE

ERROR CODE Hex / Binary		EXPLANATION	WHEN EXECUTED
FE	1111 1110	Light checking routine	SLF
FC	1111 1100	Keyboard key check	SLF

SELF-TEST DIAGNOSTIC PROGRAM

Table 5-1 (cont)
POWER-UP/SELF-TEST SEQUENCE

ERROR CODE Hex / Binary	EXPLANATION	WHEN EXECUTED
B9 1011 1001	Upper RAM walking ones check	SLF
B8 1011 1000	Upper RAM walking zeros check	SLF
B7 1011 0111	Upper RAM all ones check	SLF/PUP
B6 1011 0110	Upper RAM all zeros check	SLF/PUP
B4 1011 0100	System vector table expansion	SLF/PUP
FA 1111 1010	Keyboard identification set	SLF/PUP
CE 1101 1110	Processor ROM check	SLF/PUP
9F 1001 1111	Power Up/Reset	PUP
9E 1001 1110	Display/Display Control Test	SLF
9D 1001 1101	Display DMA/Vector Generator check	SLF
9C 1001 1100	Font initialization	PUP
AF 1010 1111	CMOS and ROM to RAM load	SLF/PUP
AF 1010 1111	CMOS and ROM to RAM load	SLF/PUP
EB 1110 1011	Interrupt checker	SLF/PUP
DD 1101 1101	Host port register checker	SLF/PUP
DC 1101 1100	Host port baud/character checker	SLF
CD 1100 1101	Option numbers checker	SLF/PUP
CC 1100 1100	Version compatibility checker	SLF/PUP

SLF means the test is performed during Self-Test.

PUP means the test is performed during the Power-Up routine.

SELF-TEST FIRMWARE JUMP TABLE

To further aid in understanding how Self-Test works, refer to the ROM Header-Pointer diagram (Figure 5-3). This diagram shows how Self-Test is arranged around a "jump-table" system. This arrangement allows code updates and additions/deletions of option code sections to be mapped in or out easily.

HOW TO RUN SELF-TEST

Start Self-Test running by pressing the MASTER RESET and SELF TEST buttons. Press and hold MASTER RESET and SELF TEST, then release the MASTER RESET button. After the Keyboard LEDs begin to "cycle", release the SELF TEST button.

The test begins by turning on all the keyboard lights ("CAPS LOCK" key, four function key LEDs, and four indicator LEDs). The CAPS LOCK key light should turn off immediately (while the other eight LEDs remain lit). If the CAPS LOCK key light remains lit, there is a major malfunction in the processor.

While Self-Test is running, the eight keyboard lights blink through the codes for the various tests. When a fatal error occurs during a particular test, its identifying light pattern comes on blinking, and the bell will ring three times. These light patterns are displayed on the eight indicator LEDs, across the top of the keyboard¹. These light patterns indicate the binary equivalent of a hexadecimal code assigned to each major set of tests. The error message tables (in this section) list and define these error codes, giving an explanation for each error condition and suggesting which piece of circuitry malfunctioned. After the major error codes have been displayed, most problems can be narrowed down through the use of submessages. Submessages are displayed by first noting the major error codes, pressing RETURN, and noting the next set of lights displayed as the submessage. In some instances, there may be up to three levels of submessages.

After the display has been checked, most error messages are printed on the display screen. Such screen-displayed error messages first print the name of the test or the hardware module being tested. Then a submessage on the next line, tells which part of the test failed.

¹Eight LEDs, from KYBD LOCK light to the HARD COPY key light.

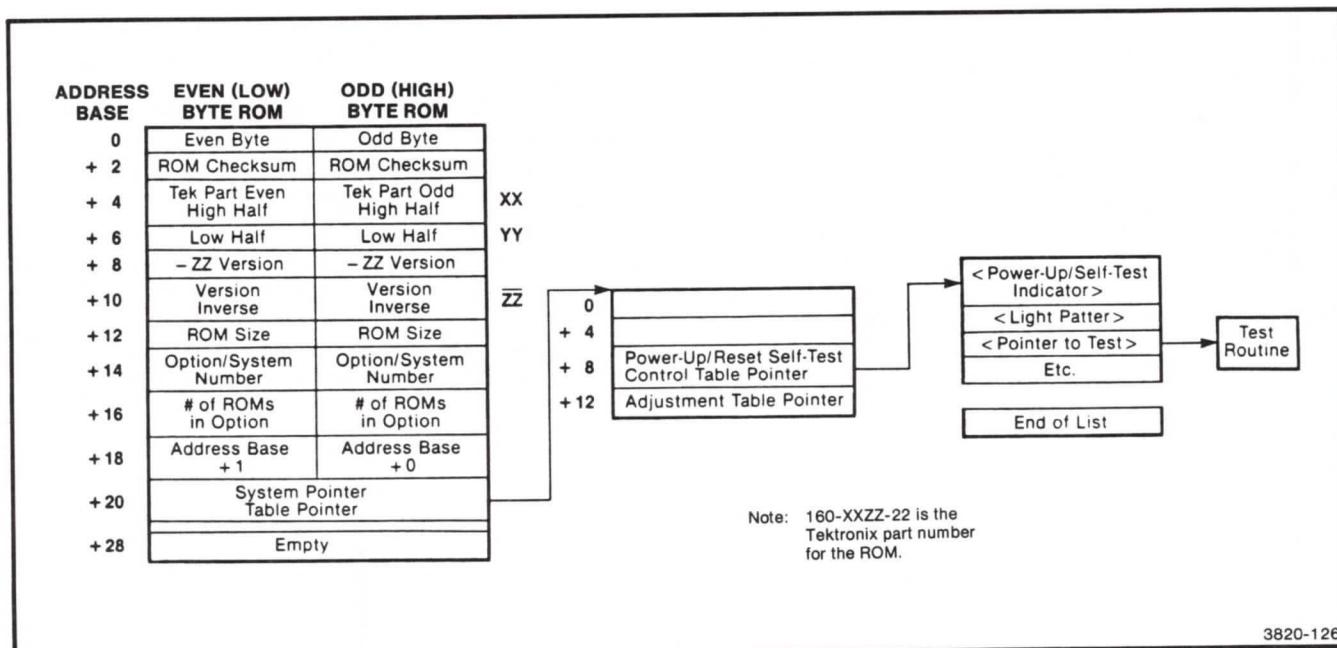

Figure 5-3. The ROM Header Contains a Chain of Pointers to Testing and Adjustment Routines That Are Executed Via Jump Tables.

SELF-TEST DIAGNOSTIC PROGRAM

Suppose Self-Test finds a major hardware problem that prevents the test from running to completion. Such is indicated by the light code for this test (where problem found) remaining lit indefinitely. This type of problem is highly unlikely, but could be caused by a bad ROM. Read the error code on the lights and use this to help determine where the test has aborted.

During the Delay Memory check (associated with Table 5-7, RAM Tests) there is a 14 second wait for each 32K of RAM being tested. In a fully loaded instrument (one with all RAM options installed), this test can take up to four minutes to run. Do not be surprised about this delay; it does not mean that Self-Test is "hung." If you wish to override this lengthy test, enter CONTROL D during the keyboard check and Self-Test will skip over this test.

SELF-TEST ERROR MESSAGES

This part of the section lists and describes the Self-Test error codes. In the following discussion, tests are grouped in modules according to the hardware being tested. Under each heading (test module name) is a short general description of the test and hardware it checks. Each table of error messages defines those messages that may appear while that test is running. To determine which piece of circuitry malfunctioned, read the list of active circuits for each test. Since many circuits are used in several tests, eliminate as "good" those circuits that passed all previous tests. These tables are grouped together for referencing convenience rather than the order in which the tests occur. Tables start with the error code FE (1111 1110) and are listed in descending order of the binary codes. Table 5-2 shows this order.

ERRORS DIRECTORY

Table 5-2 is a reference that shows which table to consult when any given error message is displayed. The Hex codes, in the center column, correspond to the light codes (displayed in binary on the LEDs) for each test category.

Keyboard Check and Lights (F)

When Self-Test starts, the indicator LEDs will show FF (1111 1111). As the test continues the light patterns approach 00.

During the keyboard lights check, each light is slowly turned on and off in a sequential loop beginning with the keypad, going across the eight LEDs (right to left), and down to the CAPS LOCK key. This circling light pattern is then repeated quickly.

At the beginning of the keyboard keys test the 4114 rings the bell once, and the CAPS LOCK key light starts blinking. This prompts the user to press a key (any key) after waiting a few seconds. When the bell rings and the CAPS LOCK key blinks, the test is supposed to stop and wait for a key stroke. If the test proceeds without pressing a key, this means spurious key strokes are being generated. This type of problem could be caused by dirt or corrosion in the keyboard, or a poor connection in the keyboard-to-processor board ribbon cable. If the test waits for a key entry, then press a key, allowing the tests to continue. Waiting too long before pressing a key causes the test to "time out" and continue (this usually takes about 20 seconds).

Table 5-2
SELF-TEST ERRORS DIRECTORY

TEST MODULE	HEX CODE(*)	TABLE NUMBER
KEYBOARD/PROCESSOR	Fx	5-3
PROCESSOR BOARD	Ex	5-4
RAM/BUS HOST PORT	Dx	5-5
SYSTEM OPTION ROMS	Cx	5-7
RAM TEST	Bx	5-8
CMOS MEMORY	Ax	5-9
DISPLAY BUS AND BOARD CHECK	9x	5-10
SYSTEM LEVEL ERROR CODES (**)	7x	5-11
3PPI (OPTION 10)		5-12
DISK (OPTION 42)		5-13
TABLET (OPTION 13/14)		5-14

(*) x Indicates this hexadecimal digit will change within the table.

(**) The 7x error codes are not part of Self-Test but are rather error codes that are generated if a problem occurs during normal use of the terminal. Self-Test does not have to be initialized to receive these error messages.

Table 5-3
KEYBOARD/PROCESSOR BOARD ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1111 1110 FE	Error at beginning of keyboard lights test. (Circling lights test happens here.)
1111 1101 FD	Error at end of keyboard lights test.
1111 1100 FC	Error during keyboard keys test.
1111 1010 FA	Error while loading Keyboard Identification Code.

Submessage: (printed on screen)

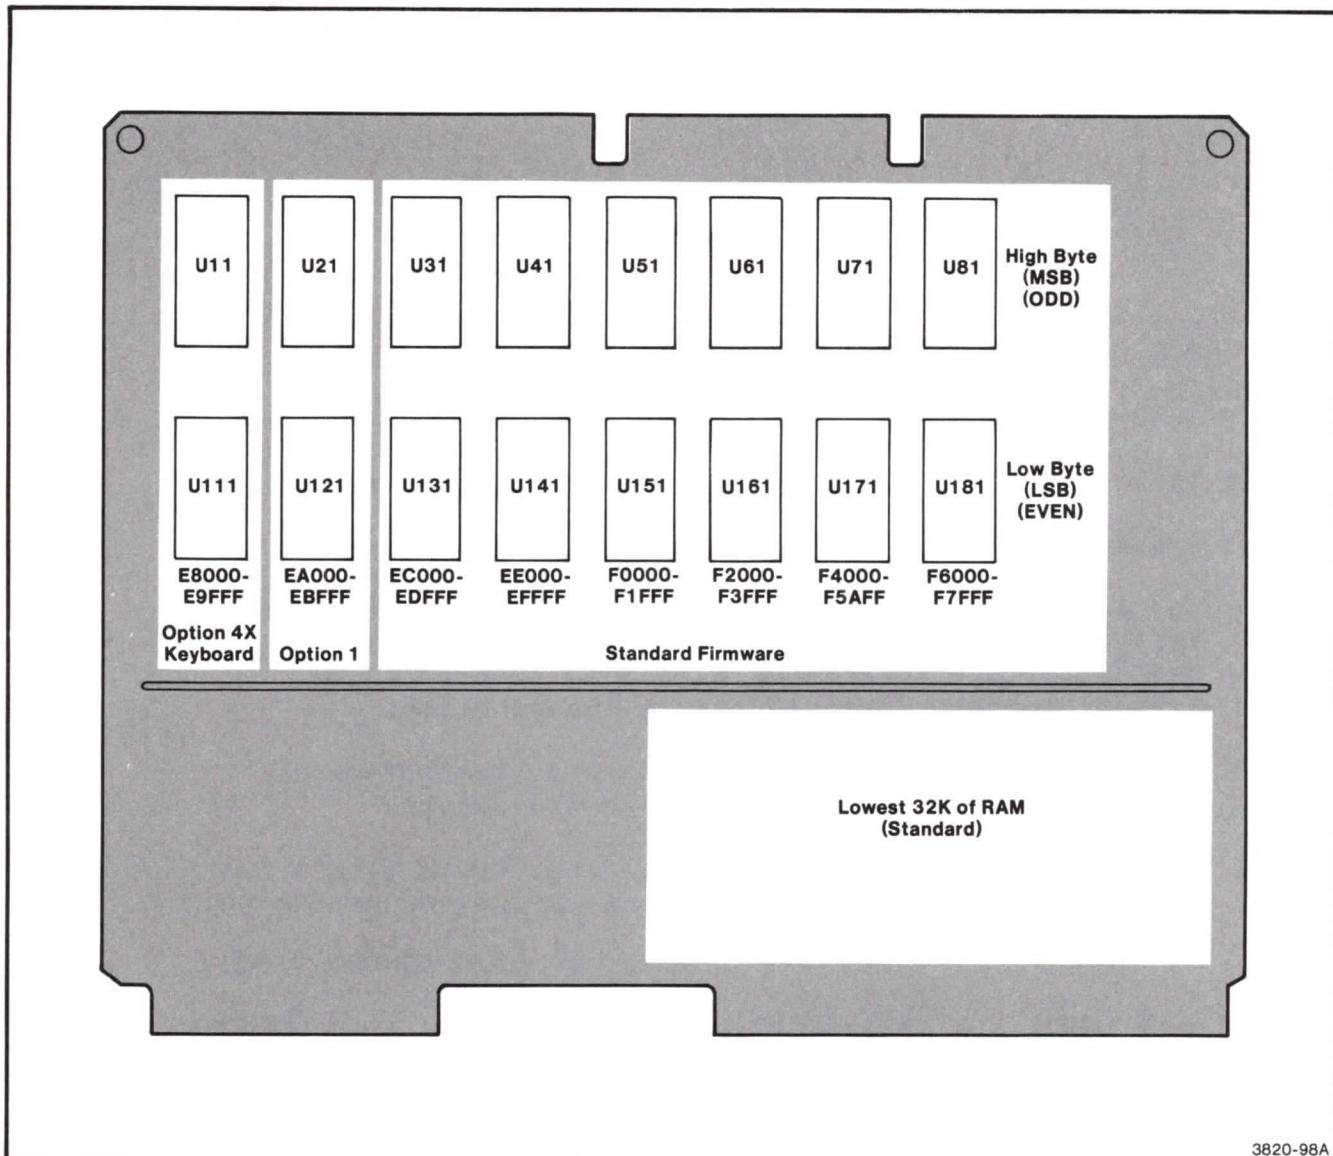

"Keybrd -ID XX"

XX is the option number of the keyboard attached (example: a Swedish keyboard is Option 4C). This test then checks the validity of that Option number against the ROM Option number installed, and displays this message if the wrong ROMs or no ROMs (for the option) are present. See Figure 5-4 for the location of the keyboard ROMs.

"Keybrd -ID fail"

The identification test will fail when the 4114 cannot reset the keyboard and read the keyboard option number. This may be caused by a broken or loose connection.

CIRCUITS USED: Look for problems on Keyboard, Keyboard interface on the Processor Board, and keyboard ribbon cable and connectors.

3820-98A

Figure 5-4. RAM/ROM Board.

Processor Check (E)

At this time, Self-Test does a more thorough test of the Processor board and Keyboard functions. The processor

and its related hardware are systematically exercised.

Table 5-4

PROCESSOR BOARD ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1110 1111 EF	Error detected during Timer test. (a) Submessage: Bell; press RETURN, read light code.
	The submessage for the timer test will consist of the following parts: The highest four bits will be one of two codes, the lower four bits will be one of two possible codes. These codes are listed below.
0001 ----	Failed static test; tests timers' outputs for high/low values.
0010 ----	Failed dynamic test; tests timers for correct count vs. processor execution.
---- 0000	Failure in Timer 0 (I/O address 00E1).
---- 0001	Failure in Timer 1 (" " 00E3).

NOTE 2: Timer 2 cannot be tested at this point. It is checked later during the host port check.

Table 5-4 (cont)
PROCESSOR BOARD ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1110 1110 EE	Failure during timer initialization.
1110 1100 EC	Error during standard ROM checksum test.
(a) Submessage 1: Bell; press RETURN, read light code.	
X X nnnn nnnn	Address of ROM problem in Hex XX000. (i.e., 1111 1110 = FE --> Address where problem found is FE000 'X'. This is first ROM pair on the Processor Board.) See Figure 5-5 for the location of the Processor board ROMs.
(a) Submessage 2: Bell, press RETURN again, read light code.	
This submessage consists of two parts, with the highest four bits consisting of one of three codes, and the lowest four bits of the message consisting of one of three possible codes. These codes are seen below.	
0001 ----	ROM(s) not present.
0010 ----	ROM(s) checksum error.
0011 ----	Standard ROMs position check.
---- 0000	xxxxxxxxxxxxxxxxxxxx
---- 0001	Problem isolated to high ROM of pair.
---- 0010	Problem isolated to low ROM of pair.
---- 0011	Problem found in both ROMs of pair.

(a) Submessages are obtained in the following manner: When an error is noted, the bell will ring before each submessage. After noting the error bits (read from the keyboard LEDs), press RETURN, then read the submessage as the next set of lights displayed.

Table 5-4 (cont)
PROCESSOR BOARD ERRORS

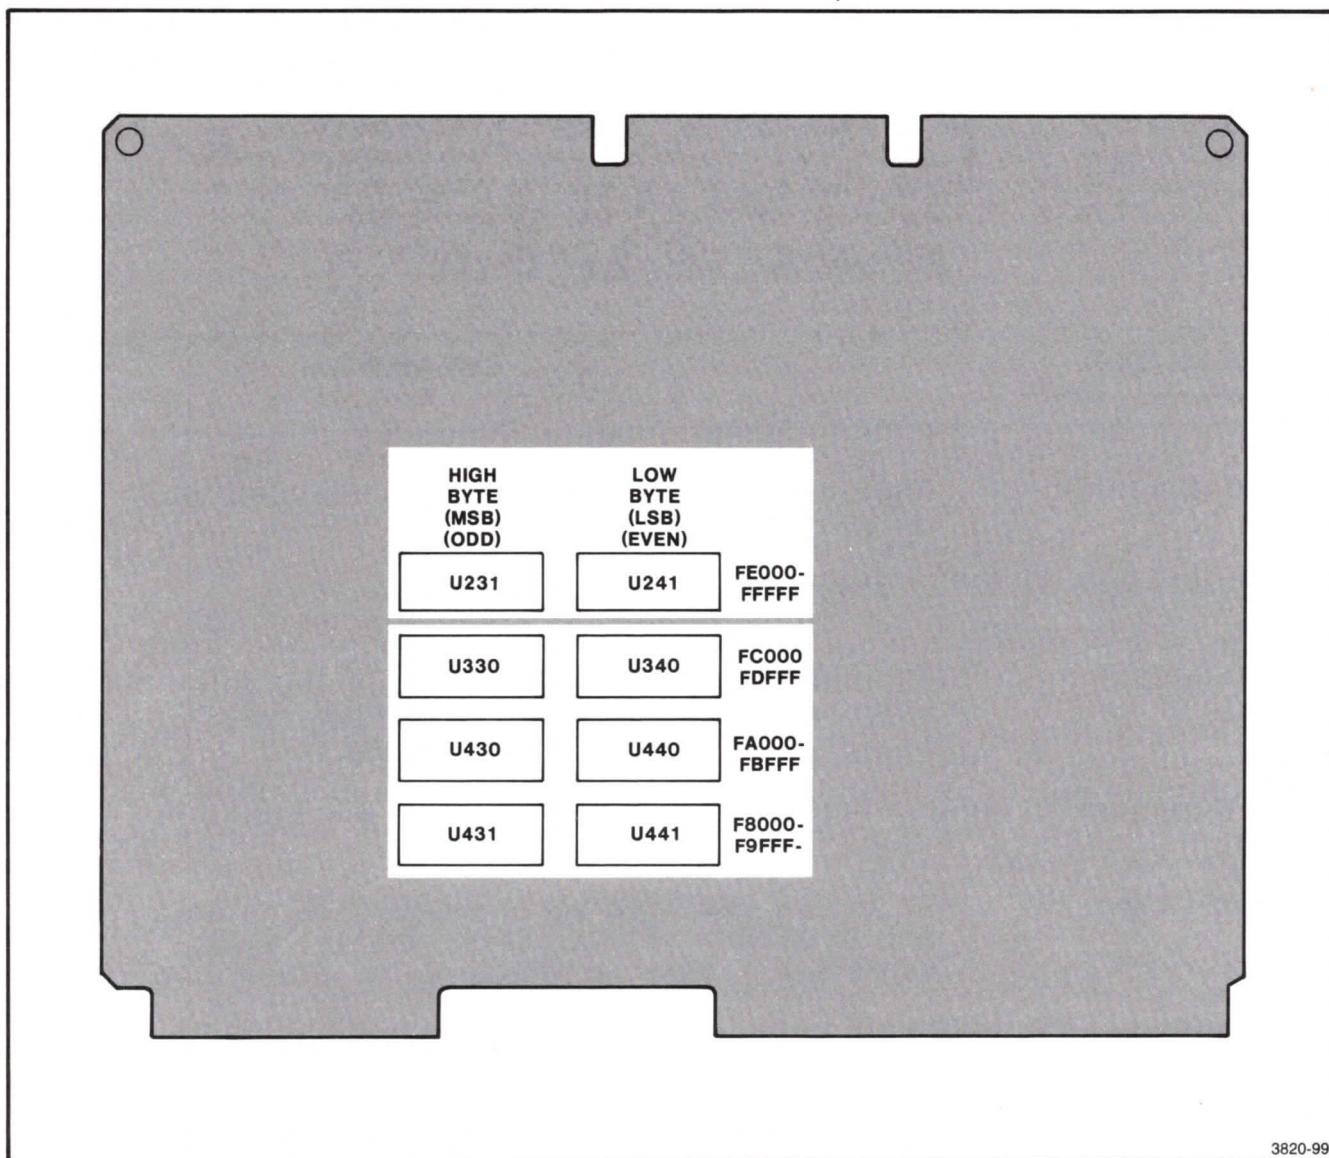

ERROR CODE Binary / Hex	EXPLANATION
1110 1011 EB	Error detected in Interrupt Handler Check
Submessages: (printed on screen)	
Interrupts-Static Error: XX	Bits that cannot be set in Interrupt Register (I/O base address 00EA).
Interrupts-Dynamic Address: XX	Level 5 interrupt performed. Failed to (b) reach interrupt vector address: XX + (4 x 5).
Interrupts-Div by 0 Address: XX	A divide by 0 instruction was performed, but did not vector through location 0. XX equals base interrupt address. (c)

CIRCUITS USED: Interrupts circuit block on Processor Board.

(b) Level five is the easiest level of interrupt to force (hence x5). Each time an increment of a level is made, it moves up four bytes in memory (hence the 4). XX equals the base interrupt address.

(c) This message with XXE00 most likely implies an earlier version of a 8086 processor chip not acceptable for Processor board operation.

NOTE 3: If either T1 or T2 inputs to the interrupt chip are stuck at a TTL low, Self-Test cannot detect this condition. Also, if an "interrupt level" output (from the interrupt chip) is stuck at a TTL low, Self-Test cannot detect this condition, either. If the interrupt chip seems to be causing a problem, examine the outputs with an oscilloscope, or replace the Processor board.

3820-99

Figure 5-5. Processor Board ROMs.

Communications and Bus Checks (D)

This set of tests examines the operation of the main terminal bus and the host I/O port. This is accomplished

by writing its own address to low RAM (located between 0000 and 7FFF). It then reads this address back, using the comparison as a bus check. This assumes the RAMs are good.

Table 5-5
RAM/BUS AND HOST PORT ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1101 1111 DF	Problems with low bits of main terminal bus or addressing via this bus.
(a) Submessage 1: Bell, press RETURN, read light code.	
X X nnnn nnnn	XX indicates the base address of the RAM that caused the bus problem: XX000 'X'. (i.e., 00 = 00000 and 20 = 20000.)
(a) Submessage 2: Second Bell, press RETURN, read light code.	
Y Y nnnn nnnn	YY is the Low data byte, showing which bits are in error. If these bits are all ones, address bit zero is likely to be bad.
(a) Submessage 3: Third Bell, press RETURN, read light code.	
Z Z nnnn nnnn	ZZ is the High data byte, showing which bits are in error. If these bits are all ones, byte high enable (BHEN) is probably bad.
NOTE: If YY and ZZ are all 1s, this indicates a time-out problem while attempting to access a RAM.	
(a) Submessages 1 to 3: Bell rings before each submessage; after noting the error bits, press RETURN, read submessages as the next set of lights displayed.	

Table 5-5 (cont)

RAM/BUS AND HOST PORT ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1101 1110 DE	Problem with the high bits of the main bus or addressing via this bus. Here it is writing high RAM (between 8000 and highest address) its address as data; then reading it back.
1101 1101 DD	Error detected during host port I/O address check

Submessage: (printed on screen)

"Host Port-Registers
Expect: XX Receive: YY"

This test checks the reset of the USART. After resetting USART, it reads the data at status I/O address: E2. It expects to read XX. If instead it receives YY (where XX not = YY) this means the test failed and the USART cannot be reset.

"Host Port-Register
Expect: XX-YY Receive: ZZ-AA"

The test checks USART Latch (I/O address EB), and USART Interrupt Request (" " E8).

XX - Latch status expected; is 0 if no bits are in error.

YY - Interrupt Request bits in error; is 0, if no bits are in error.

ZZ - Latch Status bits in error.

AA - Interrupt Request bits in error.

Table 5-5 (cont)

RAM/BUS AND HOST PORT ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1101 1100 DC	Error detected during host port baud rate/ character check
Submessage: (printed on screen)	
"Host Port-Baud/Character Baud: XXXX Expect: YY-AA Receive: ZZ-BB"	
XXXX - Baud rate in hex (see Table 5-6). YY - character sent. AA - USART data status bits in error; expect 00 (I/O address E4). See Figure 5-6. ZZ - character received. BB - USART Data Status bits in error.	
CIRCUITS: All RAM locations 0000 to 7FFF and 8000 to top RAM address bus lines connecting Processor and RAM/ROM board.	

NOTE 4: Self-Test cannot check the following signals if they are tied to a TTL low: MWTC; PFAIL; BCLK; INT1; INT2; INT3; INT4; INT6; INT7; BREQ; and BGT.

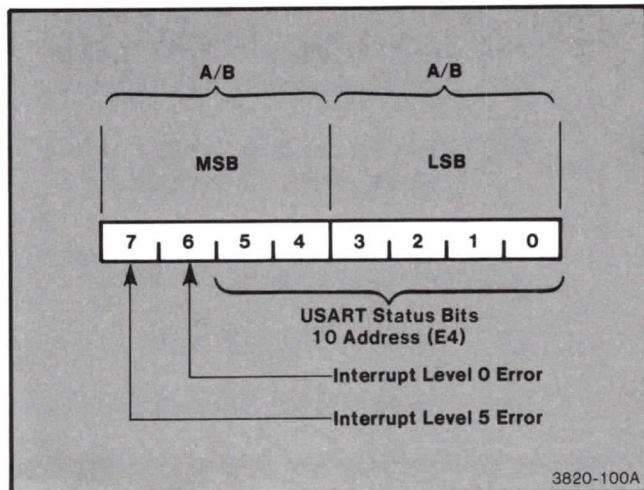

Figure 5-6. Status Byte.

The following table may be used to convert Hex numbers received into decimal numbers.

Table 5-6
HEX-TO-DECIMAL EQUIVALENTS

HEX NUMBER	DECIMAL NUMBER
12C	300
258	600
4B0	1200
708	1800
7D0	2000
960	2400
E10	3600
12C0	4800
1C20	7200
2580	9600
4B00	19200
9600	38400

Memory Tests

ROM Check (C). This set of tests examines the operation of all ROMs on the RAM/ROM board and all

option ROMs. The ROMs on the Processor board were tested along with the processor in previous tests. For the locations of the bad ROMs on the RAM/ROM board, refer back to Figure 5-4.

Table 5-7
SYSTEM/OPTION ROMS ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1100 1111 CF	Failure during ROM Map generation.
1100 1110 CE	Error found during ROM checksums test.
Submessages:	Error messages are same as for main ROMs; see Table 5-4.
1100 1101 CD	ROMs found in wrong position (options only). Submessages: (Displayed on screen) "ROM-Position Address: XXXX Expect: YY-ZZ Receive: AA-BB" ROM Set: CC-Fail Address XXXX -- the base address of the ROM pair being checked. See NOTE 1, below. Expect YY-ZZ -- 1) YY is the ROM Set number (same as option number). 2) ZZ indicates even or odd ROM of pair. (If ZZ is odd, then odd ROM is problem; if ZZ is even, then even ROM is problem). Receive AA-BB -- found ROM Set number AA (instead of YY); BB (like ZZ) indicates odd vs. even of pair. ROM Set CC-Fail -- CC is option (ROM Set) number of ROM that failed.

NOTE 1: If FFFF, then Self-Test could not find the ROM pair indicated by "Expect: YY-ZZ".

Table 5-7 (cont)

SYSTEM/OPTION ROM ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1100 1101 CD (cont)	<p>ROMs in wrong position.</p> <p>Example> Address: 1600 Expect: 42-17 Receive: 42-15 ROM Set: 42-Fail</p> <p>Means -- that the base address of the ROM pair being checked is 16,000. 42 is the ROM set number expected (disk). 17 is base address + 1 (odd ROM of pair). If 16 is base address + 0 (even ROM " "). The test found 42-15 at the address; 42 was the ROM Set, and 15 means the odd ROM for location 14,000 was found there (instead of odd ROM for 16,000).</p>
1100 1100 CC	<p>ROM version compatibility problem</p> <p>Submessage: (printed on screen) "ROM-Version ROM Set: XX-VV Expect: YY-ZZ Receive: AA-BB ROM Set: CC-Fail"</p> <p>ROM Set used for reference is XX (see NOTE 2), and its version number is VV. "Expect YY-ZZ" refers to the expected ROM option name YY, and version number ZZ for the ROM Set being checked. "Receive AA-BB" reports the actual ROM name (AA) and version (BB) in same socket.</p> <p>Example> ROM Set: 00-05 Expect: 42-03 Receive: 42-01 Means -- The main system firmware (called 00) is version 5. It expects Option 42 ROMs with version 3 or higher to be installed. Instead, it finds Option 42 ROMs, with only version 1 firmware, installed.</p> <p>ROM Set: CC-Fail ROM failure -- CC is number of Option where version problem appeared. This ROM set is mapped out of the option.</p>

CIRCUITS USED: RAM/ROM Board ROMs and circuits, and ROMs on option boards.

NOTE 2: XX is option number. System ROMs number is always 00.

SELF-TEST DIAGNOSTIC PROGRAM

RAM Check (B). This series of tests perform a systematic check of all system RAMs. Each set of tests are grouped, and each such group uses the same type of error reporting scheme (light codes). Refer back to Figure 5-4, which shows the physical location of the lowest 32K of RAM.

In the following tests, the RAM Memory Delay Check (BB) generates a light code which may remain lit for as much as 14 seconds while the test is running. This does not indicate an error. An error is indicated by a bell accompanied by a light code which stays on indefinitely. The lengthy Delay Memory Check may be overridden by entering CONTROL D during the keyboard check.

NOTE

In the following table, "Lowest 32K RAM" refers to the RAM from hexadecimal address 0000 to 7FFF, or the standard RAM of the 4114. "Upper RAM" refers to any extended RAM options installed in the 4114, starting at hexadecimal address 8000.

Table 5-8

RAM TEST ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1011 1111 BF	Lowest 32K of RAM, walking ones check. (Here each bit is set and tested, in order from left to right, hence the "walking ones" term.) This light code is accompanied by one of the following light code submessages.
(a) Submessage 1: Bell rings, press RETURN, read light code.	
X X nnnn nnnn	XX indicates the address of the RAM problem at XX000 'X'.
(a) Submessage 2: Second bell, press RETURN, read light code.	
Y Y nnnn nnnn	YY is the Low Data byte, showing which bits are in error.
(a) Submessage 3: Third bell, press RETURN, read light code.	
Z Z nnnn nnnn	ZZ is the High Data byte, showing which bits are in error.

Table 5-8 (cont)

RAM TEST ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1011 1110 BE -----	(b) Error in "walking zeroes check;" lowest 32K RAM.
1011 1101 BD -----	(b) Error in "all ones check;" lowest 32K RAM.
1011 1100 BC -----	(b) Error in "init (zero check); " lowest 32K RAM..
1011 1011 BB -----	(b) Error in "RAM memory delay check." During the RAM memory delay check, data is held for 14 seconds and then rechecked. The light code will remain lit for this time.
1011 1010 BA -----	"RAM Memory Map Generation" error. This test checks for RAM and the absence of RAM and generates a corresponding memory map.
1011 1001 B9 -----	(b) Error in "walking ones check;" upper RAM.
1011 1000 B8 -----	(b) Error in "walking zeroes check;" upper RAM.
1011 0111 B7 -----	(b) Error in "all ones check;" upper RAM.
1011 0110 B6 -----	(b) Error in "init (zero check); " upper RAM.
1011 0101 B5 -----	Error during RAM stack building.
1011 0100 B4 -----	Error in operating system vector table (lowest 32K of RAM)

(a) Submessages are obtained in the following manner: when an error is noted, the bell will ring. After noting the error bits (read from the Keyboard LEDs), press RETURN, then read the submessage as the next set of lights displayed.

(b) If one of these messages is displayed as an error (the bell rings), the three submessages earlier in the table will have to be read in order to locate the problem.

SELF-TEST DIAGNOSTIC PROGRAM

CMOS Check (AF). When a CMOS memory error is detected, the LEDs will show the "AF" pattern (1010 1111), and a message is written on the display screen. The only time a full CMOS check is performed is during the Adjustment Procedure. See Processor Board menu at the end of this section.

NOTE

The following CMOS error messages report a change in default parameters. This may be caused by either: changing EPROMs, or by a CMOS battery/circuit failure.

Table 5-9
CMOS MEMORY ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1010 1111 AF	CMOS check
"Cmos-Error I/O Address: XXXX Expect: YY41 Receive: ZZZZ	<p>XXXX = Address of problem. If it is addressing correctly, the address will read FFFE.</p> <p>YY41 = YY is the system version number (taken from EPROM) and 41 indicates 4110 series product.</p> <p>ZZZZ = this is what is actually read, instead of YY41.</p>
"Cmos-Checksum"	Checksum error detected.
"Setup Default-Reset"	CMOS parameters have been updated. This is the same as the Power-up message.

DISPLAY TESTS (9)

The Self Test program tests the two circuit boards that control how information is displayed on the display module screen: the Display Controller and Vector Generator boards. This set of tests also determines whether the display module is functioning, but does not isolate problems to individual boards or circuits in the display module.

If the Direct Memory Access (DMA) controller is malfunctioning, it can "hang" the system bus. If this happens, the processor will not be able to access the display test code. The terminal will then appear to "hang" on one of the light codes shown in Table 5-10.

Table 5-10

DISPLAY CONTROLLER, VECTOR GENERATOR, AND DISPLAY MODULE ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1001 1111 9F	4114 Power Up/Reset Check
(a) Submessage 1: Bell, press RETURN, read light code:	
0000 0001	Display Module
0000 0010	Vector Generator
0000 0011	Display Module or Vector Generator
0000 0100	Display Controller
0000 0101	Display Module or Display Controller
0000 0110	Display Controller or Vector Generator
0000 0111	Cannot isolate problem
If 0001 appears as the four most significant bits (leftmost), A fatal error is indicated--these circuits will not work at all or will always generate errors.	

Table 5-10 (cont)

DISPLAY CONTROLLER, VECTOR GENERATOR, AND DISPLAY MODULE ERRORS

ERROR CODE Binary / Hex	EXPLANATION
----------------------------	-------------

(a) Submessage 2: Bell, press RETURN, read light code:

Error Code	Explanation	I/O Port Read	Bit Checked (b)
0000 0001	No I/O port D0 read	D0	0—15
0000 0010	Vector in progress (bit active)	D0	3
0000 0011	Display list in progress (bit active)	D0	0
0000 0100	No I/O port D2 read	D2	0—15
0000 0101	SLU bit active	D2	11
0000 0110	Z bit active	D2	13
0000 0111	Long jump latch active	D2	9
0000 1000	Long vector latch active	D2	8
0000 1001	Generator running active	D2	2
0000 1010	Vector available active	D2	1

Note that these light codes are in consecutive binary order. This is the order in which the tests are done. Thus, if the light code 000 0111 appears, for example, all of the tests previous to this have been done and are functioning.

(a) Submessages are obtained in the following manner: When an error is noted, the bell will ring. After noting the error bits (read from the keyboard LEDs), press RETURN, and read the submessage as the next set of lights displayed.

(b) The 0 bit is the least significant bit (rightmost) and the 15 bit is the most significant bit.

Table 5-10 (cont)

DISPLAY CONTROLLER, VECTOR GENERATOR, AND DISPLAY MODULE ERRORS

ERROR CODE Binary / Hex	EXPLANATION
1001 1110 9E	Display Check Display Controller Check
(a) Submessage 1: Bell, press RETURN, read light code.	
0000 0001	Display Module
0000 0010	Vector Generator
0000 0011	Display Module or Vector Generator
0000 0100	Display Controller
0000 0101	Display Module or Display Controller
0000 0110	Display Controller or Vector Generator
0000 0111	Cannot isolate problem

If 0001 appears as the four most significant bits (leftmost), this indicates a fatal error. These circuits do not work at all or always generate errors. The terminal hangs with flashing lights.

(a) Submessage 2: Bell, press RETURN, read light code.

Table 5-10 (cont)

DISPLAY CONTROLLER, VECTOR GENERATOR, AND DISPLAY MODULE ERRORS

ERROR CODE Binary / Hex		EXPLANATION	
Error Code	Explanation	I/O Port Read	Bit Checked
0000 0001	No I/O port D2 read	D2	0 - 15
0000 0010	DBUSY active after View mode is reset	D2	10
0000 0011	Ready for command bit not active	D0	1
0000 0100	Long jump latch won't set	D2	9
0000 0101	Long jump latch won't reset	D2	9

SELF-TEST DIAGNOSTIC PROGRAM

Table 5-10 (cont)

DISPLAY CONTROLLER, VECTOR GENERATOR, AND DISPLAY MODULE ERRORS

ERROR CODE Binary / Hex	EXPLANATION
If 0001 appears as the four most significant bits (leftmost), this indicates a fatal error. These circuits do not work at all or always generate errors. The terminal hangs with flashing lights.	
(a) Submessage 2: Bell, press RETURN, read light code.	
0000 0001	Long Jump does not work
0000 0010	Scaling displacement failure
0000 0011	Time too short on timing test
0000 0100	Time too long on timing test
0000 0101	Display Controller not ready
1001 1100 9C	Character Font Initialization
CIRCUITS: Replace Vector Generator or Display Controller boards. Check bus connection and cable connection to display module. Check Display Module.	
(a) Submessages are obtained in the following manner: when an error is noted, the bell will ring before each submessage. After noting the error bits (read from the keyboard LED's), press RETURN, then read the submessage as the next set of lights are displayed.	
(1) These numbers correspond to the X or Y Display Address Counters. The first number is the starting address during the test and the second is the ending address during the test (see submessage 2 under the error code 9E, located on the previous page).	
(2) Short vector format was used (see submessage 2 under the error code 9E, located on the previous page).	

SYSTEM LEVEL ERRORS (7X)

These error messages prompt the user whenever the specified problem occurs. These error codes may appear at any time: NOT just during Self-Test. When

such an error message appears, run Self-Test to locate any defective circuitry that may be involved. Most of these errors involve improper use of the terminal and are referred to as "system level" errors, rather than hardware errors.

Table 5-11
SYSTEM LEVEL (7x) ERROR CODES

ERROR CODE Binary - Hex	EXPLANATION
0111 1111 7F	CMOS memory lacking Could not get enough memory for system initialization. Try resetting CMOS parameters.
0111 111 7E	No monitor level procedure. A monitor procedure was called from an interrupt service routine (ISR). This error should only happen when a file is downloaded containing software ISRs.
0111 1101 7D	System data structures scrambled- RAM data lost. Try resetting the terminal or checking any routines created in the terminal or loaded into the terminal that may be writing into the wrong area.

SELF-TEST DIAGNOSTIC PROGRAM

Table 5-11 (cont)

SYSTEM LEVEL (7x) ERROR CODES

ERROR CODE Binary - Hex	EXPLANATION
0111 1100 7C	<p>Unexpected or illegal interrupt.</p> <p>If this error code is generated, it is suggested that Self-Test be run to pinpoint the interrupt failure area. Note: could spurious interrupt have been generated by operator?</p>
0111 1011 7B	<p>Error Handler could not set dynamic memory for an error message.</p> <p>Check the user allocation of RAM through the STA MEM (status memory) command for available memory.</p>

4114 OPTION TESTS AND ERROR MESSAGES

Self-Test is extended to three options that can be installed in the 4114. Options 42/43 (one or two disk drives) require a Disk Controller board. This circuit board contains ROMs which allow it to test itself when Self-Test is run. Likewise, the 3PPI board and Tablet Interface board (options 10 and 13/14 respectively) also contain ROMs which allow these circuit boards to test themselves when Self-Test is run. Options 24 through 29 (extended RAM options) are also checked during Self-Test, but by the normal firmware, and not by firmware in ROMs on the RAM boards. RAM above the standard 32K bytes is noted as 'Upper RAM' in the RAM test (located earlier in this section).

Error messages for the 3PPI board, Disk Controller board, and Tablet Interface board are the same for both the 4112 and 4114 terminals, since these boards are interchangeable in both terminals.

3PPI Board Tests

These error codes may appear while running Self-Test, only if the 3PPI Option is installed and the host port cables are in use. For a 3PPI cable testing procedure, go to the "3PPI Adjustment Menu/Procedure" at the end of this section.

Table 5-12

3PPI ERRORS

ERROR CODE Binary / Hex	EXPLANATION
0110 1111 6F	<p>Error detected during Register check.</p> <p>Submessage: (printed on screen)</p> <p>I/O Address: FBnn Expect WW-XX Receive: YY-ZZ</p> <p>Explanation: The information reported by this error code is interpreted as follows:</p> <ul style="list-style-type: none"> nn = register in error WW = expected data YY = actual data ZZ = actual interrupt

Table 5-12 (cont)

3PPI ERRORS

ERROR CODE Binary / Hex	EXPLANATION
0110 1110 6E	Error detected during 3PPI Character check. Submessage (printed on screen): 3PPI Baud/Character Baud: nnnn Expect: WW-XX Receive: YY-ZZ Explanation: nnnn = Baud rate (Hex). WW, XX, YY, ZZ are explained under the 6F error message.
	The following error messages may also appear on the screen.
3PPI Baud/Character Baud: nnnn Expect:00-02 Receive:00-FF	This means that no character data is received.
3PPI Baud/Character Baud: nnnn Expect: FF-00 Receive: nn-00	This means that there is a data transmission error where nn was was the character sent.

The Character check test uses internal loop-back testing. There is no interaction between this test and external equipment. The equipment is operation at either the system preset rate or 1200 baud, whichever is higher.

NOTE 7: Refer the table earlier in this section to convert the hexadecimal numbers received into decimal numbers.

Option 42/43 Self-Test Error Messages. Start the program running in the same manner as the normal Self-Test (by pushing the SELF TEST and MASTER RESET keys in the proper succession).

NOTE

Do NOT insert or remove a disk while Self-Test is running as this will generate unexpected interrupts.

Table 5-13
DISK OPTION ERRORS

ERROR CODE Binary / Hex	EXPLANATION
0101 1111 5F	Board Status Register Check
This test validates the operation of the hardware comprising the Board Status Register (at X'FC00'). Each Read/Write bit in the register is set (set=0) and tested; it is again reset and tested.	
Submessage: (printed on screen)	
"Disk - Board Status Register"	These tests check each bit in the BSR (Board Status Register).
"Disk - ADR19-1 not = 0"	Wrote a 0 to ADR19 (D3 of FC01) and read back a 1.
"Disk - ADR19-1 not = 1"	Wrote a 1 to ADR19, but read back a 0
"Disk - ADR19-1 not reset, =1"	Wrote a 0 to reset ADR19, but read a 1.
"Disk - INTE-0 not working"	Did not read back what was written at D6.
"Disk - BUSW-0 not working"	Did not read back what was written at D5.
"Disk - HDL3-0 not working"	Did not read back what was written at D3.

NOTE 8: The first three submessages listed check the ADR19 Address Counter.

Table 5-13 (cont)

DISK OPTION ERRORS

ERROR CODE Binary / Hex	EXPLANATION
"Disk - HDL2-0 not working"	Did not read back what was written at D2.
"Disk - HDL1-0 not working"	Did not read back what was written at D1.
"Disk - HDL0-0 not working"	Did not read back what was written at D0.

Circuits used: Address Decode, Input Data Buffer, and Board Status Register.

0101 1110 5E

Initialize and check Disk Controller

The FDC is put into its command phase (regardless of its present state) via a series of command reads and writes. The following bits are tested for correct state:

Under X'FC00' -- D7 (EOC-1)
 Under X'FC08' -- D7 (RQM-1) and D6 (DIO-1).

A SPECIFY command is then issued by the processor.

Submessages: (printed on screen)

"Disk - Controller Protocol"

"EOC-0 is 0 after init" FDC generates an unexpected interrupt, bit is in wrong state after initialization.

"Disk - DIO-1 is 0 -
 Write required"

FDC required a write to it, while processor expects to read from it.

Table 5-13 (cont)

DISK OPTION ERRORS

ERROR CODE Binary / Hex	EXPLANATION
"Disk - DIO-1 is 1 - Read required"	FDC requires a read from it, but processor expects to write to it.
"Disk - DIO-1 is 1 after init"	Bit D6 is in wrong state after initialization.
"Disk - RQM-1 remains 0"	FDC never sends RQM-1 (fails in 1000 tries).
"Disk - Cannot restore Protocol"	Runs initialization sequence, but cannot put FDC into a known state. (Processor has no idea what FDC is doing).

Circuits used: FDC, Board Status, Control Strobes, Data MUX, and Address Decode.

0101 1101 5D Drive present check

The processor issues a SENSE DRIVE 0 STATUS (SDS) command. Drive 0 should be present. The D7 (RQM-1) and D6 (DIO-1) are tested for correct states before and during the command.

Submessage: (printed on screen)

"Disk- F0: not present"	Drive 0 should always be present. This message means the FDC or Disk Drive control cannot find drive unit 0.
-------------------------	--

Circuits used: FDC's disk control I/F, and Disk Drive Control circuits.

Table 5-13 (cont)

DISK OPTION ERRORS

ERROR CODE Binary / Hex	EXPLANATION
0101 1100 5C	Intersystem Interrupt check
The following procedure is used to generate an interrupt: The heads are unloaded (should already be unloaded from last test), and the processor issues a RECAL DRIVE 0 command. Recal is executed, but the head does not move. The FDC does not know that the heads were unloaded, so it generates an interrupt. An error is also reported, unless head was already at Track 0.	
The processor then issues the SENSE INTERRUPT STATUS (SIS) command to read the results of the RECAL command. The results of the SIS command are checked as well as RQM-1 and DIO-1.	
Submessages: (printed on screen)	
"Disk - Intersystem Interrupt Check"	
"Disk -Bad FC00 init"	Board Status Register contains error (different state than expected).
"Disk -Bad FC08 init"	FDC status register contains an error (different state than expected).
"Disk -Bad FC00 RECAL-1 status"	Error in Board Status Register (BSR) after first byte of RECAL command written.
"Disk -Bad FC08 RECAL-1 status"	Error in FDC after first RECAL byte written.
"Disk -Bad FC00 RECAL-2 status"	Error in BSR after second RECAL byte written.
"Disk -Bad FC08 RECAL-2 status"	Error in FDC after second RECAL byte written.
"Disk -Level 7 interrupt not present"	Expected interrupt not present.

Table 5-13 (cont)

DISK OPTION ERRORS

ERROR CODE Binary / Hex	EXPLANATION
"Disk -Bad FC00 SIS status"	Error in BSR after Sense Interrupt status byte written.
"Disk -Bad FC08 SIS status"	Error in FDC after Sense Interrupt status byte written.
"Disk -ST0 data error"	Error in ST0, read at FDC.
"Disk -Bad FC00 ST0 status"	Error in BSR after ST0 status byte read.
"Disk -Bad FC08 ST0 status"	Error in FDC after ST0 status byte read.
"Disk -Track error"	Error in track number (PCN), read at FDC.
"Disk -Bad FC00 Track status"	Error in BSR after track number read.
"Disk -Bad FC08 Track status"	Error in FDC after track number read.
"Disk -Level 7 interrupt still present."	Interrupt still present.

Circuits used: Address Decode, Board Status, Control Strobes, Data MUX, and FDC.

Table 5-13 (cont)

DISK OPTION ERRORS

ERROR CODE Binary / Hex	EXPLANATION
0101 1011 5B	DMA Operation check
Submessage: (printed on screen) "Disk - DMA transfer failed"	Data ('80') not found at current DMA address (RAM only).
Circuits: DMA State Machine, Data MUX, Control Strobes, Address Decode, Address Counters, Input Data Buffers, and Board Status blocks.	
0101 1010 5A	DMA addressing check
Both this test and the previous test must be completed before the DMA State Machine and the DMA Address Counters are fully tested; the testing of one requires the operation of the other.	
The DMA Address Counters are write only. The only way to look at these counters is to examine the most significant bit (MSB), which is at D4 of the Board Status Register (X'FC00').	
The twenty bit counters are subdivided into three groups: High Nibble (FC01), Middle Byte (FC02), and Low Byte (FC03). Each group is tested individually in the following manner.	

Table 5-13 (cont)

DISK OPTION ERRORS

ERROR CODE Binary / Hex	EXPLANATION
<hr/>	
-- HIGH NIBBLE TEST --	
Test high nibble first because all bits must ripple through the high nibble while testing the middle and low bytes.	
 STEP SET-UP	
1. Load High Nibble with 0. 2. Does D4 = 0 ? See NOTE.	
 TEST	
3. Load Middle Byte and Low Byte with X'FF.' 4. Step DMA. 5. Does D4 = 0 ?	
 TEST	
6. Repeat steps 3 through 5 eight times. 7. On eighth time, does D4 = 1 ? 8. Repeat another eight times. (D4 should = 1 for these eight.) 9. On sixteenth time, does D4 = 0 ?	
 NOTE 9: If D=1 an error message is reported. All "D=N?" steps will cause an error unless the number is as expected. Error messages are in the accompanying tables.	
DMA Address Check (continued)	
 -- MIDDLE BYTE TEST --	
 STEP SET-UP	
10. Load High Nibble with 7. 11. Does D4 = 0 ? 12. Load Middle Byte X'FF.'	
 TEST	
13. Load Low Byte with X'FF.' 14. Step DMA. 15. Does D4 = 0 ? 16. Reload Low Byte with X'FF' (leave Middle Byte since we are testing it).	
17. Repeat steps 13 through 15; on 256th does D4 = 1? (Does High Nibble equal eight?).	

Circuits used: FDC, Board Status, Control Strobes, Data MUX, and Address Decode.

SELF-TEST DIAGNOSTIC PROGRAM

Table 5-13 (cont)

DISK OPTION ERRORS

ERROR CODE Binary / Hex	EXPLANATION
SET-UP	
18. Reload High Nibble with F.	
19. Does D4 = 1 ?	
TEST	
20. Reload Low Byte with X'FF,' and Step DMA.	
21. Repeat step 19 twohundred fiftysix times.	
22. On 256th time does D4 = 0 ? (High Nibble = 0)	
-- LOW BYTE TEST --	
Same procedure as Middle Byte test except the Low Byte and Middle Byte are reversed.	
Error Messages for DMA Address Counters	
Submessages (printed on screen):	
"Disk - DMA Address Counters - ADR19-1 Error	
"Early 0-1 @ FC01"	Error detected at steps 2 or 5 (Counter reached 8 too soon)
"No 0-1 @ FC01"	Error detected at step 7.
"Early 1-0 @ FC01"	Error detected at step 8.
"No 1-0 @ FC01"	Error detected at step 9.
"Early 0-1 @ FC02"	Error detected at steps 11 or 15.
"No 0-1 @ FC02"	Error detected at step 17.
"Early 1-0 @ FC02"	Error detected at step 19.
"No 1-0 @ FC02"	Error detected at step 22.
"Early 0-1 @ FC03"	Same explanation as for FC02 messages,
"No 0-1 @ FC03"	above, except substitute FC03 for FC02
"Early 1-0 @ FC03"	in explanation of Middle Byte tests.
"No 1-0 @ FC03"	

These tests check the clocking and carries of one counter to the next.

Circuits used: Same circuit blocks as used in DMA Operation Check,
except Data MUX not used.

Tablet Self-Test Error Codes. The light codes for the tablet are indicative of failure of the tablet to complete a Self-Test sequence; the operation of the Tablet Controller board should be investigated.

During the tablet test, the proper error message is printed on the terminal screen if a test fails to pass. These submessages are accompanied by one of the following light codes (listed in Table 5-14).

A soft error will allow the tablet to be used. It alerts the operator that a problem exists.

A fatal error removes the tablet from the interrupt routine of the terminal. The tablet can not be used until the problem is corrected and the error cleared.

Table 5-14

TABLET ERROR MESSAGES

ERROR CODE Binary / Hex	EXPLANATION
0100 1111 4F	<p>Board Communications check error.</p> <p>Submessage: (printed on screen)</p> <p>"Tablet -Board I/O Timeout"</p> <p>May appear during either the Power-Up sequence or Self-Test. It indicates that the terminal firmware is unable to communicate with the Tablet Controller board, and that a processor timeout occurred when communication was attempted. This is a FATAL error.</p>
0100 1110 4E	<p>Data Register bit check error.</p> <p>Submessage: (printed on screen)"</p> <p>"Tablet -Data Register Bit Error"</p> <p>Each individual bit of the data register is tested for set and reset. Message indicates at least one bit is not acting properly. This is a SOFT error.</p>

SELF-TEST DIAGNOSTIC PROGRAM

Table 5-14 (cont)

TABLET ERROR MESSAGES

ERROR CODE Binary / Hex	EXPLANATION
0100 1101 4D	Data Register count check error Submessage: (printed on screen) - Only one of the following submessages will accompany the light code: "Tablet -Data Register Counting Error (Low)" Indicates that the data register was incapable of counting from 0 to 31 by one. This is a SOFT error. "Tablet -Data Register Counting Error (High)" Indicates that the data register was incapable of counting from 0 to 65539 by 29. This is a SOFT error.
0100 1100 4C	Digitization check error. Submessage: (printed on screen) - Only one of the following submessages will accompany the light code: "Tablet -Digitization Timeout Error" A start digitization command was given to the tablet and one of the FIRE pulses was not returned within 0.5 seconds. This is a SOFT error. "Tablet -Digitization Firing Sequence Error" The status bits, indicating which data firing (X1, X2, Y1, Y2) is present, were out of sequence. This is a SOFT error.

Table 5-14 (cont)

TABLET ERROR MESSAGES

ERROR CODE Binary / Hex	EXPLANATION
"Tablet -Erroneous Interrupting Indication"	The tablet status indicates that it is trying to interrupt the processor when it should not. This is a SOFT error.
"Tablet -failed To Interrupt"	Indicates the tablet status is not trying to interrupt the processor when it should. This is a SOFT error.
"Tablet -Data Register Counting Error (Digitization)"	The data register failed to count at all during a start digitization. This is a SOFT error.

ADJUSTMENT SELF-TEST

Adjustment Self-Test is the third diagnostic program that can be used to check the terminal. Adjustment Self-Test is started in the same manner as the main Self-Test (the second part of the functional check). A procedure and some guidelines for Adjustment Self-Test are outlined as follows:

1. Start Adjustment Self-Test running by pressing and holding the SELF TEST and MASTER RESET buttons.
2. Release the MASTER RESET button.
3. After the keyboard lights begin to "cycle," release the SELF TEST button.
4. The keyboard LEDs will all turn on, and then off, and then cycle twice. This is the same as during main Self-Test.
5. After the keyboard lights finish "cycling," the keyboard bell will ring once. Then press the CTRL and C keys at the same time.
6. Once CONTROL C has been pressed, the terminal will pause for a few seconds and then display a general menu on the screen. The terminal is now in the Adjustment part of Self-Test.
7. The general menu tells which key to press to check any specified part of the terminal. These keys are always one of the eight "function keys" across the upper-left part of the keyboard.
8. Once one of these keys (designated by the menu) is pressed, a second menu (submenu) will be displayed.

Table 5-15
ADJUSTMENT CONTROL KEYS

KEY	ACTION
CONTROL C	-- Displays (returns to) the general Self-Test menu.
CONTROL D	-- Displays the current menu.
CONTROL E	-- Exits from the current routine.
SPACE BAR	-- Repeats the current pattern/test.
Shifted Keys	-- A second function for specified key. The letters "Sh" in front of the key designation on the menu, means press the SHIFT key along with the designated key.

The General Menu

The General Menu is the first message that appears on the screen after Adjustment Self-Test is entered. The general menu is common for all 4110 series terminals. An example of the general menu is shown below.

411X Menu

```
--  
f1 4114 Display  
f2 Processor Board  
f3 Disk  
f4 3PPI  
--  
Selection
```

The Disk, 3PPI, and Tablet functions only appear if that option is installed. The options may change key designations depending on which options are installed. For instance, if no disk options were installed, but the tablet and 3PPI options were, the 3PPI option would be selected by F3, and the tablet options would be selected by F4. Adjustment Self-Test for the tablet is used only in adjusting the tablet when Options 13 or 14 are installed. It is not used in this function check procedure.

During Adjustment Self-Test, pressing CONTROL C will always cause this menu to be printed on the screen.

Display Menu

After the general menu is obtained, select the display menu by pressing F1. This key is in the upper-left corner of the keyboard. After the 4114 Display Menu is selected, the following will appear on the screen:

```
4114 Display Menu  
--  
f1 Hard Copy  
f2 Gain  
f3 X Comp  
f4 Y Comp  
f5 Focus  
f6 Defocus  
f7 Beam LL-Inv  
f8 Beam UR-Inv  
Sh f1 Charge Pump  
--  
Selection  
*
```

These patterns can be used during the functional check to ensure that all display parameters are functioning properly.

f1 Hard Copy-S (Storage)

1. Press F1 to display the Hard Copy pattern.
2. Press space bar.
3. Observe the pattern erase and reappear.

f2 Gain-R (Refresh)

1. Press F2 to display Gain pattern in refresh mode.
2. Observe the crossed lines Gain pattern.
3. Press space bar.
4. Observe the Gain pattern change to storage mode.

f3 X Comp-R

1. Press F3 to display the X Comp pattern.
2. Observe only one tail (line) should be visible on each side of the screen.

f4 Y Comp-R

1. Press F4 to display the Y Comp pattern.
2. Observe only one tail (line) should be visible on the top and bottom of the screen.

f5 Focus-S

1. Press F5 to display the Focus pattern.
2. Observe the Focus pattern for uniform focus on the screen.

f6 Defocus-S

1. Press F6 to display the Defocus pattern.
2. Observe the Defocus pattern for a broad middle line in the individual patterns.

f7 Beam LL-Inv-R

1. Press F7 to display the Beam LL-Inv pattern (invisible).
2. Observe that no pattern is visible on the lower left-hand corner of the screen.

f8 Beam UR-Inv-R

1. Press F8 to display the Beam UR-Inv pattern (invisible).
2. Observe that no pattern is visible on the upper right-hand corner of the screen.

Sh f1 Charge Pump-R

1. Press SHIFT and F1 keys together to display the Charge Pump pattern.
2. Observe the Charge Pump pattern for straight and unbroken lines.

Processor Board Menu

Once the General Menu has been displayed on the screen, select the Processor Board menu by pressing F2. After F2 is pressed, the Processor Board menu is displayed. The Processor Board menu looks like this:

```
Processor Board Menu
--
f1 CMOS-Reset
f2 Keyboard
f3 Host Port
--
Selection
*
```

Working from the Processor Board menu, perform the following tests.

CMOS-Reset, Function Key F1. CMOS-Reset is used to restore the factory default settings of all the CMOS parameters. From the Processor Board menu, press F1 function key. This action prints the following message on the display:

```
*f1
CMOS-Reset
Selection
*
```

This message means that the terminal's operating parameters have been restored to their factory default settings.

Keyboard, Function Key F2. Pressing the F2 key causes every key on the keyboard to display two 2-digit hexadecimal numbers. These numbers represent the 8-bit codes that the Processor Board generates for each downstroke and upstroke of a key. Each key has its own distinct hexadecimal code, and each down-stroke code is different than the corresponding up-stroke code. The first number of the up-stroke code is always eight more than the first number of the down-stroke code. The second character in the code is the same for both the down-stroke and the up-stroke of the key. This routine will verify that each key is operating properly. Figure 5-7 shows the Keyboard keycodes.

Now return to the Processor Board menu by pressing CTRL D.

Host Port Check, Function Key F3. The Host Port routine checks the validity of the output port of the terminal. Enter the Host Port routine by pressing F3. Once this is done, the screen displays the following message:

```
Host Port
Attach Loopback
Press SpcBar
```

Connect the special loopback connector from the output port back to the input port. These connections are located on the rear panel of the terminal. See Accessories List for the Loopback Connector part number.

After the cable is connected, press the space bar. This starts the routine that sends signals representing characters 7F through 00 (at baud rates 9600 through 300). When this string of signals is sent and received properly, the screen indicates it by printing "Complete." This message means the terminal is ready to go onto the next test.

If there is an error during the Host Port routine, the following submessage wil appear on the screen:

```
"Host Port-Baud/Character
Baud: XXXX Expect: YY-AA Receive: ZZ-BB"
```

This means:

XXXX is the baud rate in hexadecimal.
YY is the signal sent (for example: 7F).
AA is the expected bits in error, this should always read 00.
ZZ is the signal received.
BB is the bits in error.

After this Host Port check is complete, return to the general menu by pressing CONTROL C. If there are no options installed, this completes the functional check of the terminal. If there are options installed, select each option listed in the general menu and perform the following checks for that option.

NOTE

Only the disk and 3PPI options may be functionally checked using Adjustment Self-Test. The tablet menu is used for alignment purposes of the Graphic Tablet only (which is external to the terminal). The electronics for the tablet that resides in the terminal (Tablet Controller Board) were checked during main Self-Test. An alignment procedure for the graphic tablet using Adjustment Self-Test is contained in the 4110 Series F13/14 Graphic Tablet Instruction Manual.

Disk Option Menu

The Disk Menu may be obtained from the general menu by pressing F3. The Disk Menu is an optional menu and will only appear if Option 42 is installed. Just as Self-Test checked out the electronics of the Disk Controller board, this routine checks the drive unit. This menu is useful for drive unit head alignment. For this purpose a special alignment diskette (not used in this functional check) is required.

NOTE

The following is only a functional check and not an alignment procedure. This check only ensures that no error messages are received and that the drive does not hang up. An alignment procedure for the disk drives is found in the "4110 Series F42/43 Disk Options Service Manual," and the "Flexible Disk Drive Instruction Manual."

This is an example of the Disk Menu (items are self explanatory):

Disk Menu

```
--  
f1 No Operation  
f2 Step up One Track  
f3 Step Down One Track  
f4 Seek Track 0  
f5 Seek Track 1  
f6 Seek Track 38  
f7 Seek Track 75  
f8 Seek Track 76  
Sh f1 Load Head  
Sh f2 Unload Head  
Sh f3 Arms Write Mode  
Sh f4 Writes Track 76 With a 2F Pattern  
Sh f5 Select Your Own Track  
Sh f6 Change Device (Drive Unit) Address  
Sh f7 Auto Load And Unload The Head On Track 0  
--  
Selection
```

If the disk option is installed, insert a disk in the drive unit before starting this test. Then make sure the WRITE PROTECT switch is set to the off position (the light is not lit).

It is best to perform this part of the functional check using a disk free of data. Performing this test may cause some data to be written on the disk. With the write protect switch off, it is possible to write over existing data. Therefore, it is best to use an outdated disk or one that contains unwanted data.

Press each of the disk menu keys in succession. No error messages should be received on any of the tests and the head should move to the selected area on the disk. After running through the head movements (in the menu), press CTRL C to return to the general menu.

NOTE

This is merely a check of the disk drive unit to ensure that no error messages are received and that the drive does not hang up. For a full alignment procedure of the drive unit, see the "4110 Series F42/43 Disk Options Service Manual."

TABLET ADJUSTMENT MENU/ PROCEDURE

When the Tablet is selected from the general menu (part of Adjustment Self-Test), the following tablet menu will appear on the screen:

```
Tablet Menu
--
f1 Tablet Timing Adjustment
--
Selection
*
```

Submessages: (printed on screen)

At this time, the interconnect cable must be connected between the Graphic Tablet and the 4114 graphic tablet port. Once this is done, the F1 key may be pressed.

The following submessages can be used to aid in adjusting the surface accuracy of the tablet. For more information on tablet adjustments, consult the Option F13/14 Graphics Tablet Instruction Manual. These submessagaes appear while running the Adjustment part of Self-Test only.

Warning: -Tablet Firing Sequence Error -

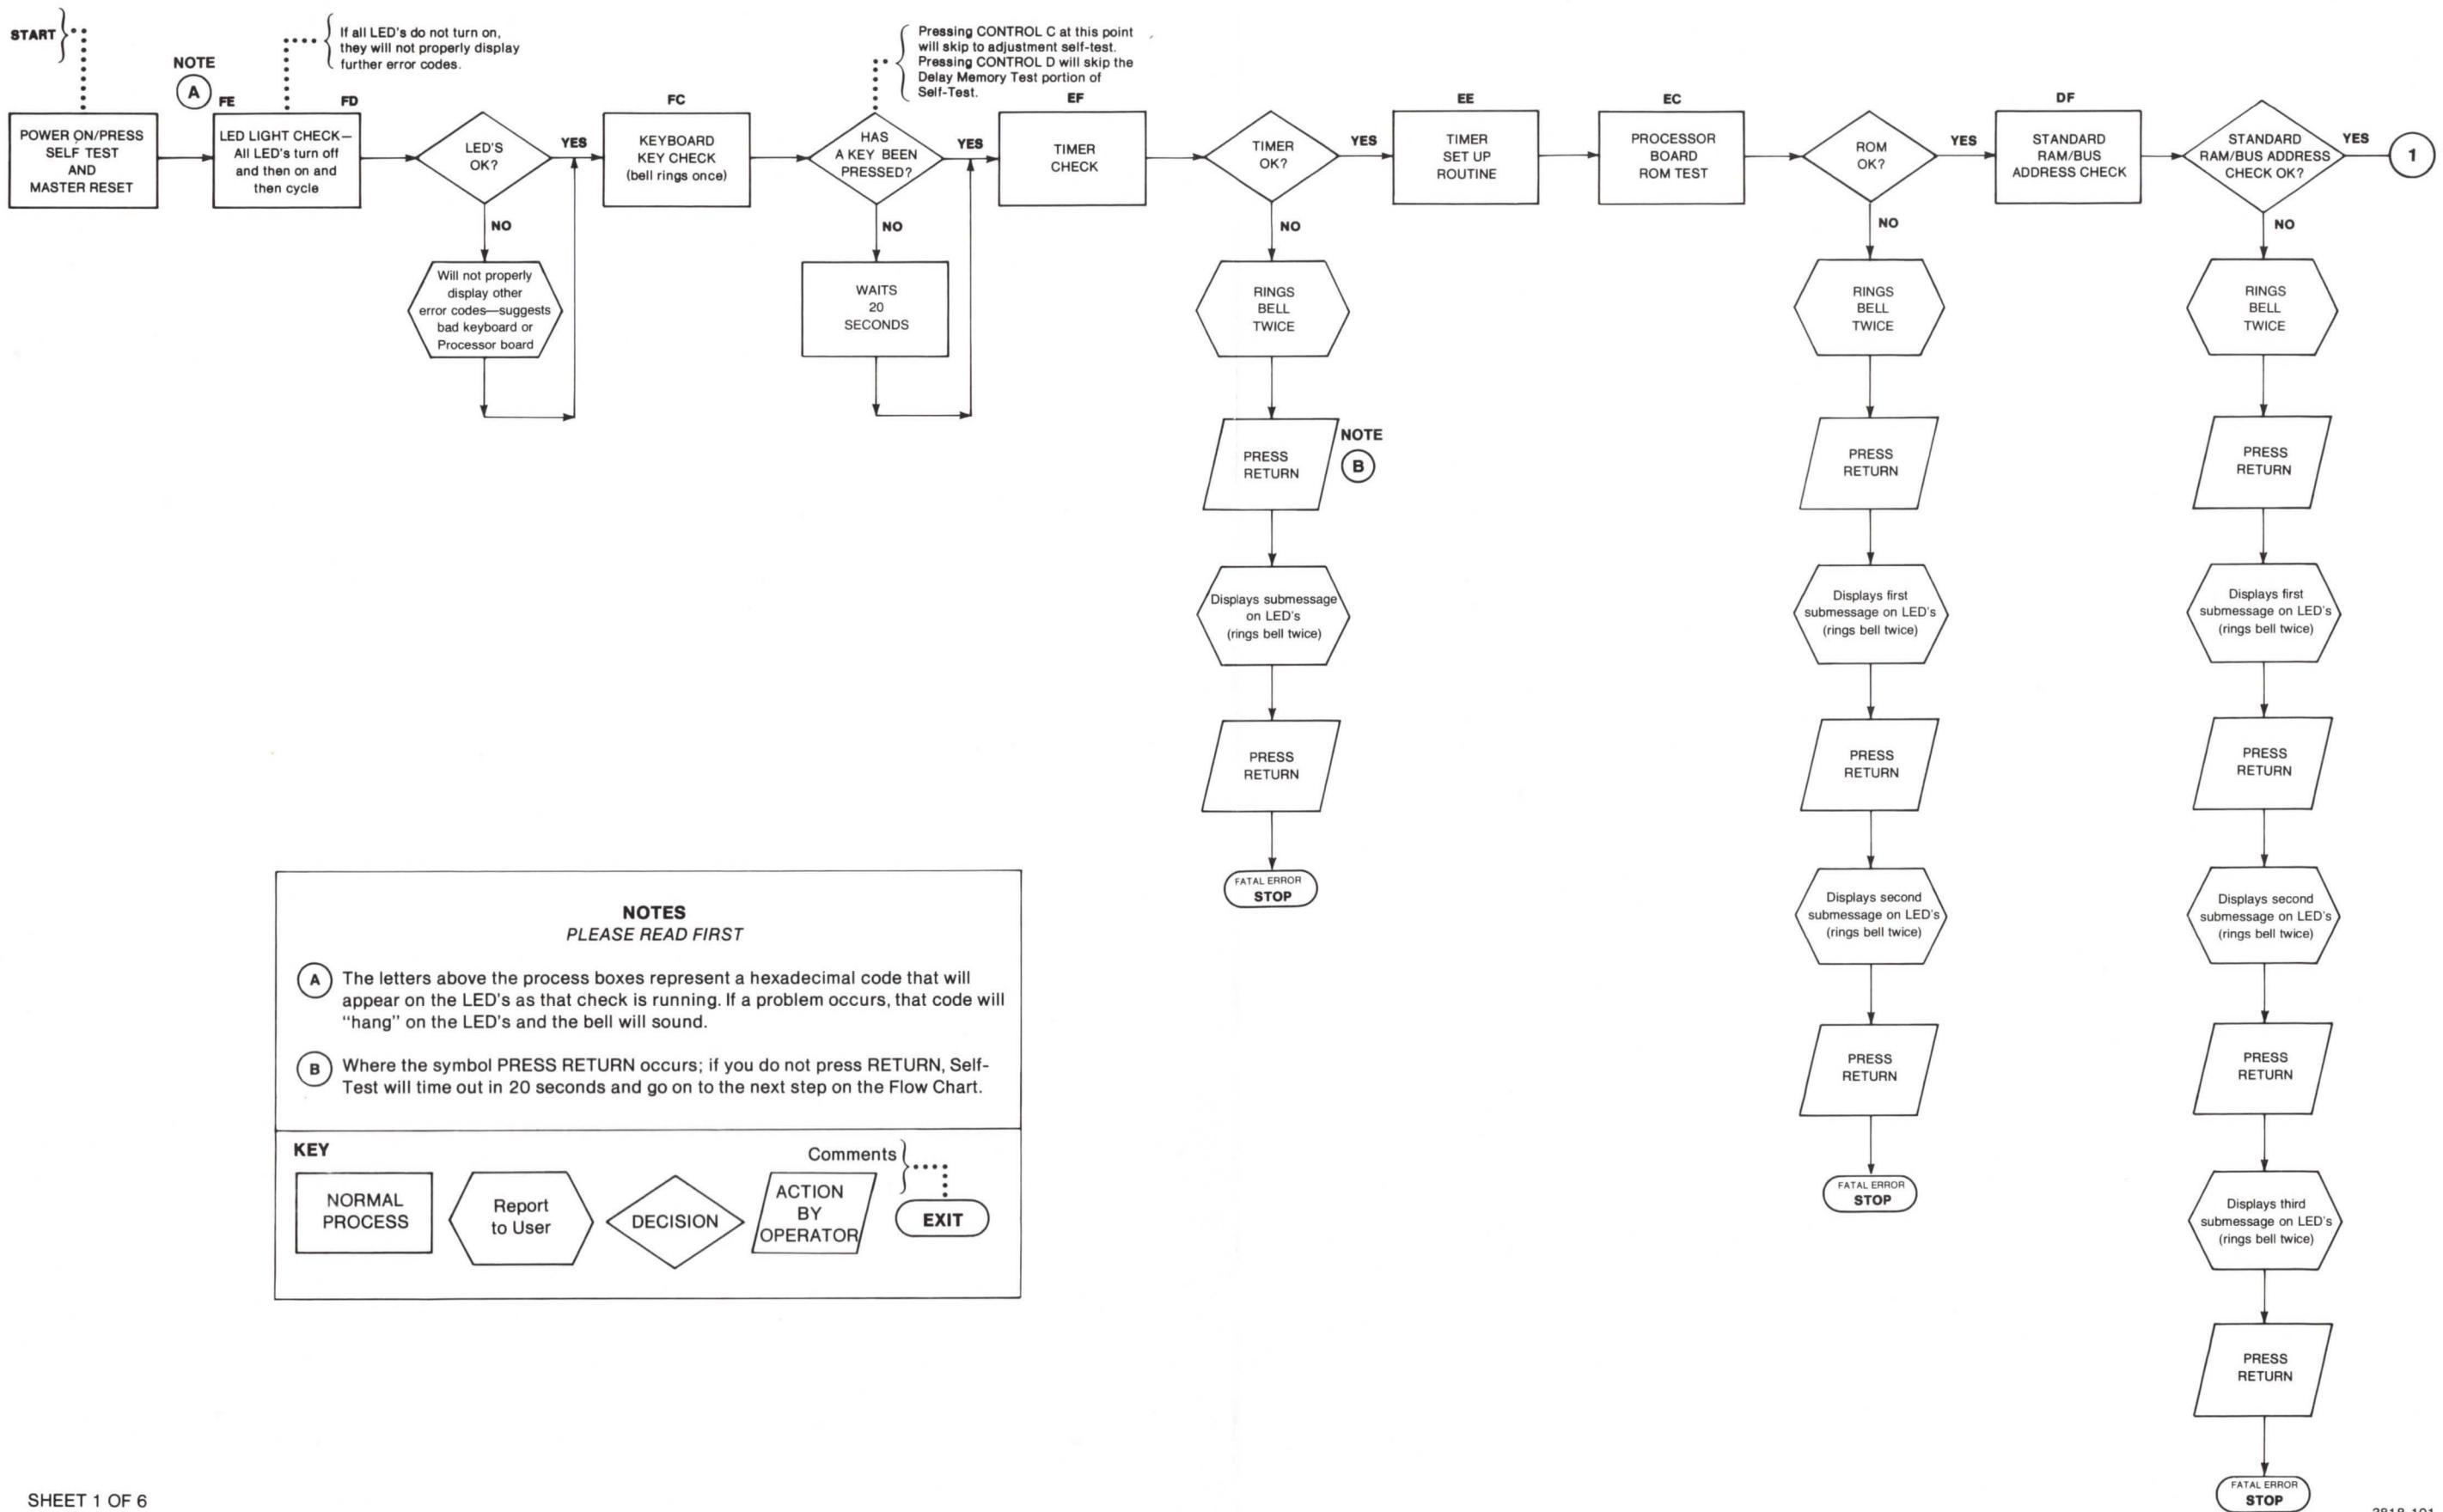

The status bits which indicate which data firing (X1, X2, Y1, Y2) is being received are out of sequence. This is a warning only; the routine will proceed normally. This message can indicate a problem on any of the circuit boards associated with the tablet.

X = NNN,NNN, Y = NNN,NNN, Button = N (using a Cursor Pen)

This is the standard message. It is displayed whenever the Z-axis switch is depressed while in presence. It displays X and Y in inches from the margin, the button number depressed (0 for stylus; Z, 1, 2, 3 for a cursor.) It also indicates whether a pen (stylus) or cursor is in use.

X Timing Straps = NNNNNNNN, Y Timing Straps = NNNNNNNN

This message is printed whenever a Z-axis switch is depressed with the stylus out of presence. It is a binary readout of the timing strap settings. A comparison of this readout with the actual strap settings will verify the proper operation of the timing straps.

REPLACEABLE ELECTRICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

LIST OF ASSEMBLIES

A list of assemblies can be found at the beginning of the Electrical Parts List. The assemblies are listed in numerical order. When the complete component number of a part is known, this list will identify the assembly in which the part is located.

CROSS INDEX-MFR. CODE NUMBER TO MANUFACTURER

The Mfr. Code Number to Manufacturer index for the Electrical Parts List is located immediately after this page. The Cross Index provides codes, names and addresses of manufacturers of components listed in the Electrical Parts List.

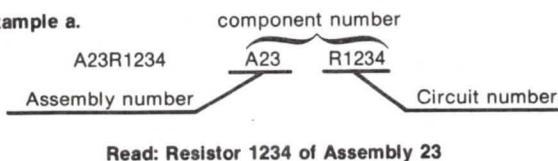

ABBREVIATIONS

Abbreviations conform to American National Standard Y1.1.

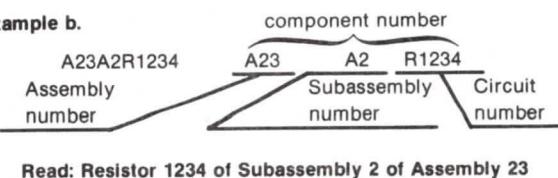

COMPONENT NUMBER (column one of the Electrical Parts List)

A numbering method has been used to identify assemblies, subassemblies and parts. Examples of this numbering method and typical expansions are illustrated by the following:

Example a.

Example b.

Only the circuit number will appear on the diagrams and circuit board illustrations. Each diagram and circuit board illustration is clearly marked with the assembly number. Assembly numbers are also marked on the mechanical exploded views located in the Mechanical Parts List. The component number is obtained by adding the assembly number prefix to the circuit number.

The Electrical Parts List is divided and arranged by assemblies in numerical sequence (e.g., assembly A1 with its subassemblies and parts, precedes assembly A2 with its subassemblies and parts).

Chassis-mounted parts have no assembly number prefix and are located at the end of the Electrical Parts List.

TEKTRONIX PART NO. (column two of the Electrical Parts List)

Indicates part number to be used when ordering replacement part from Tektronix.

SERIAL/MODEL NO. (columns three and four of the Electrical Parts List)

Column three (3) indicates the serial number at which the part was first used. Column four (4) indicates the serial number at which the part was removed. No serial number entered indicates part is good for all serial numbers.

NAME & DESCRIPTION (column five of the Electrical Parts List)

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

MFR. CODE (column six of the Electrical Parts List)

Indicates the code number of the actual manufacturer of the part. (Code to name and address cross reference can be found immediately after this page.)

MFR. PART NUMBER (column seven of the Electrical Parts List)

Indicates actual manufacturers part number.

INTERCONNECT AND BLOCK DIAGRAMS

INTRODUCTION

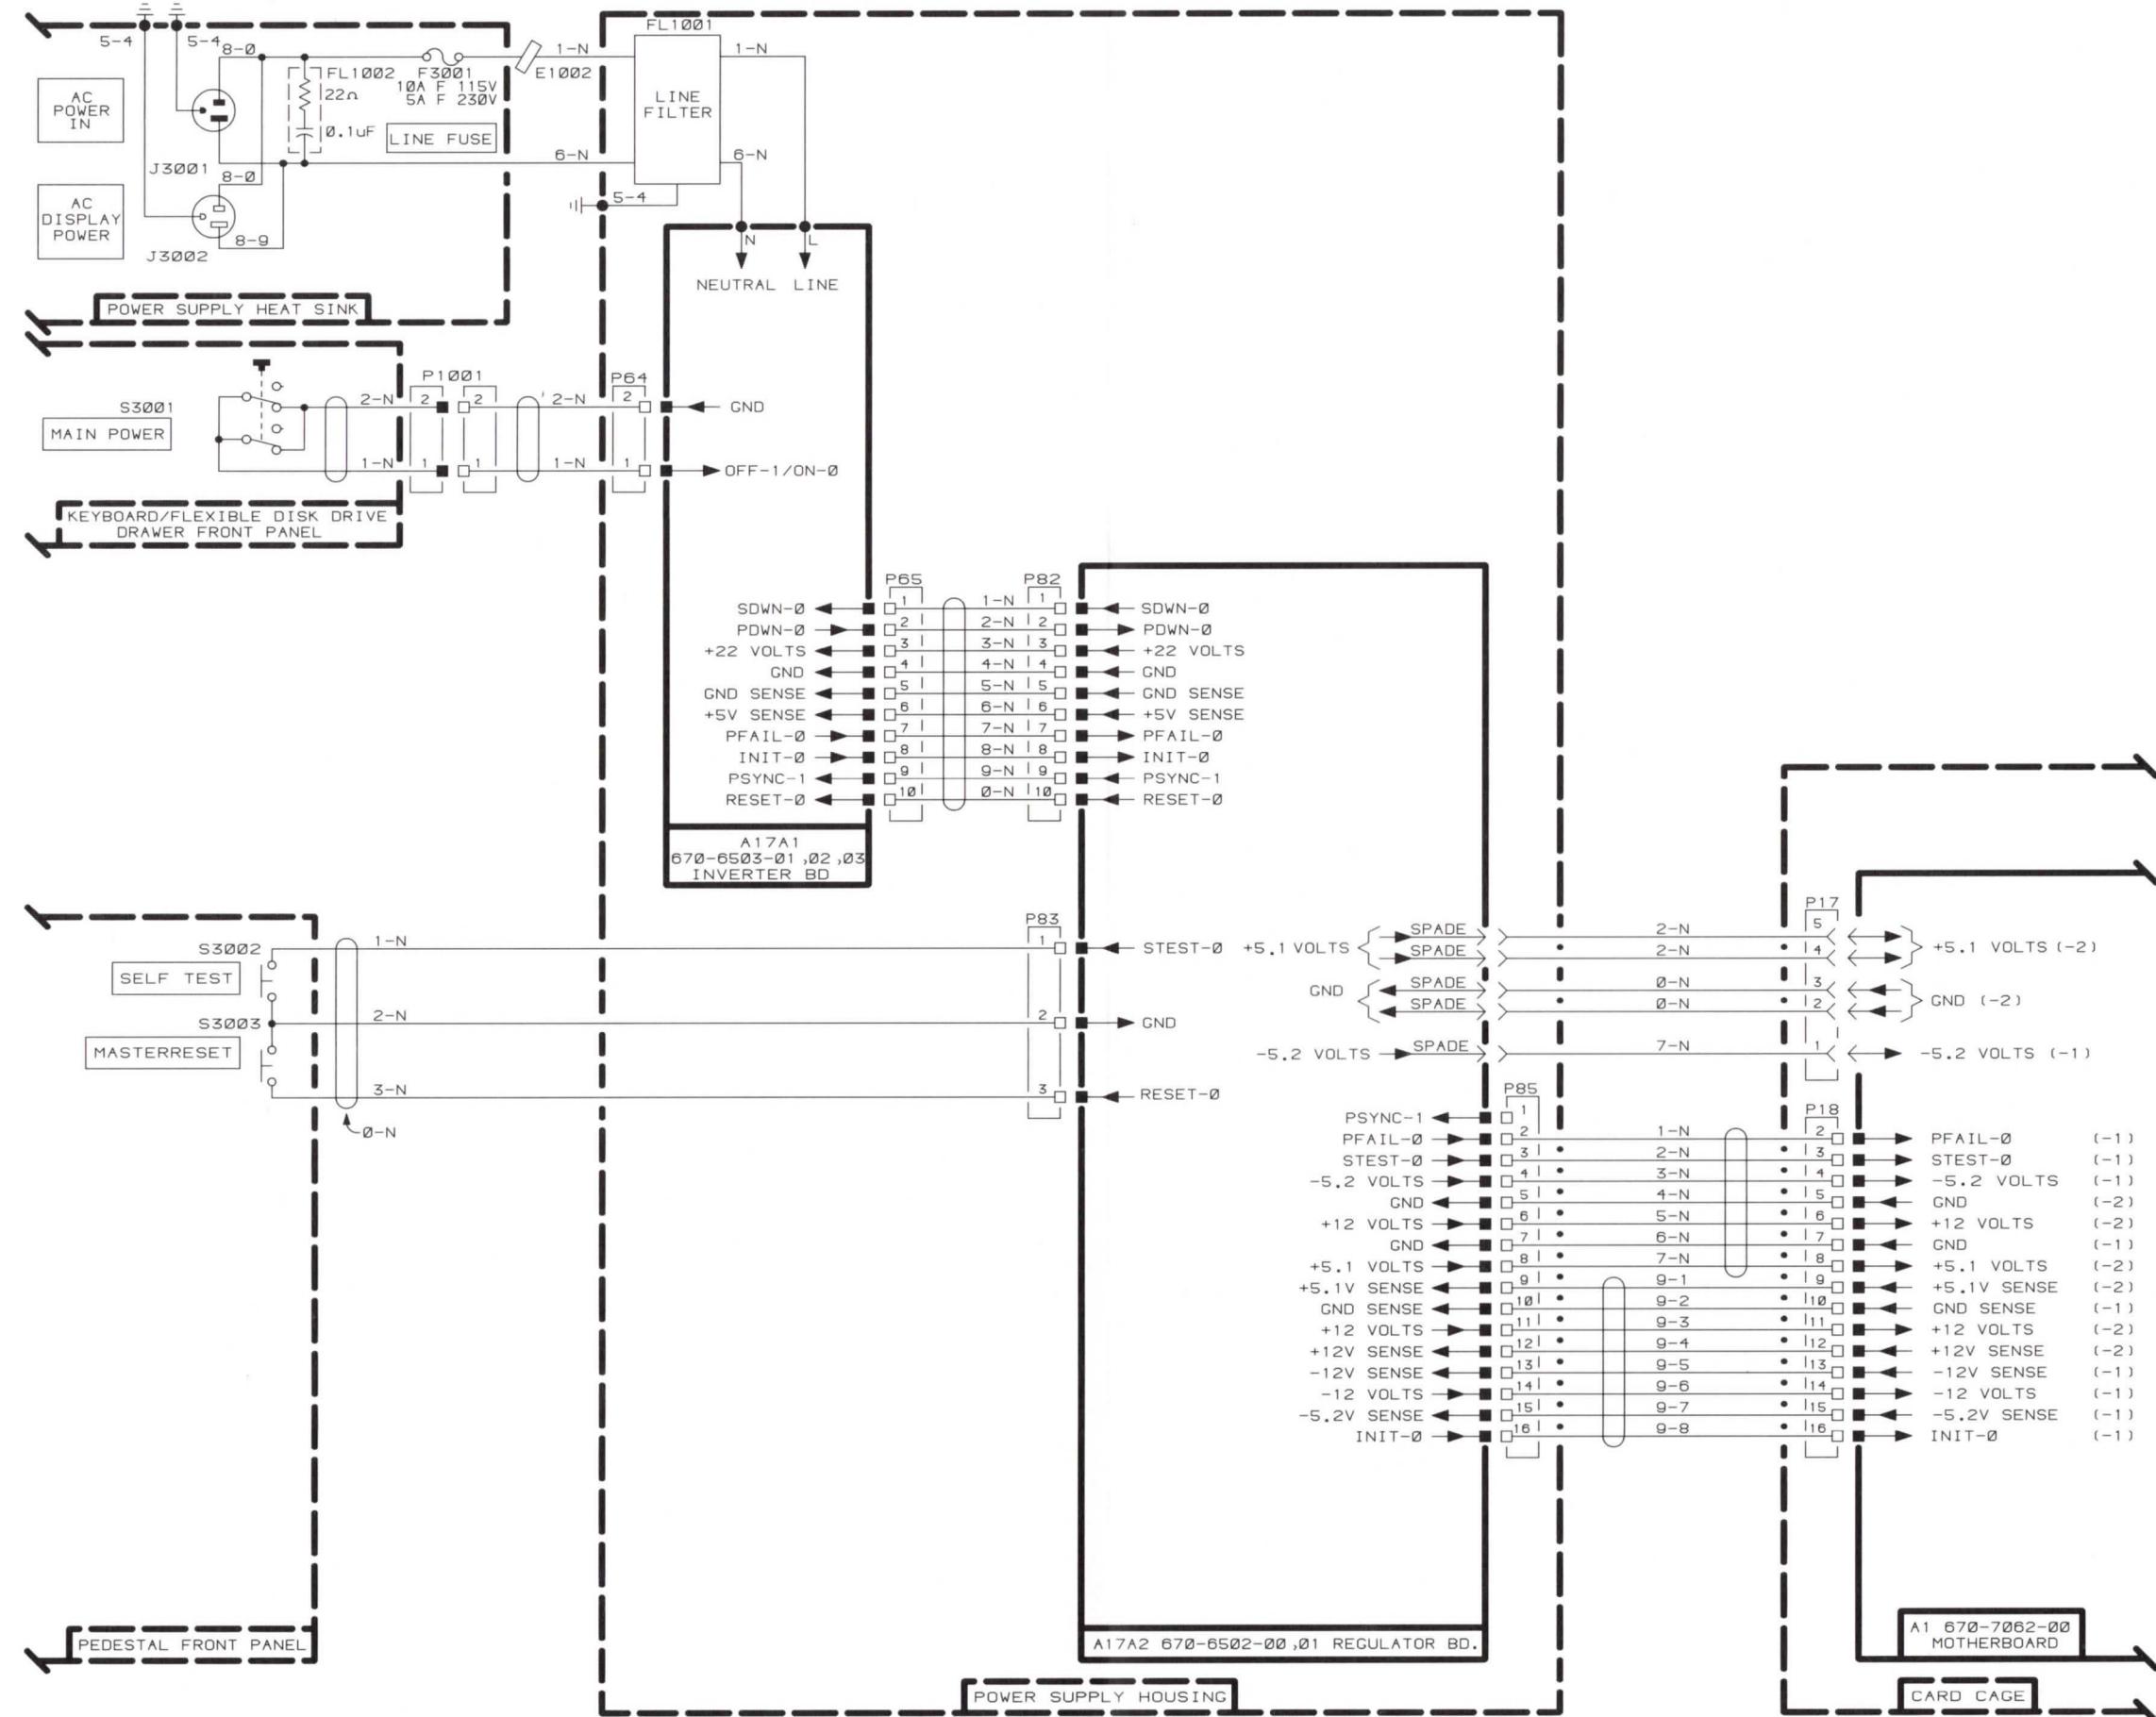

This section lists the interconnect and block diagrams for the 4114. Some of these diagrams are included in the Theory of Operation section in Volume 1; they are repeated here for ease of referencing.

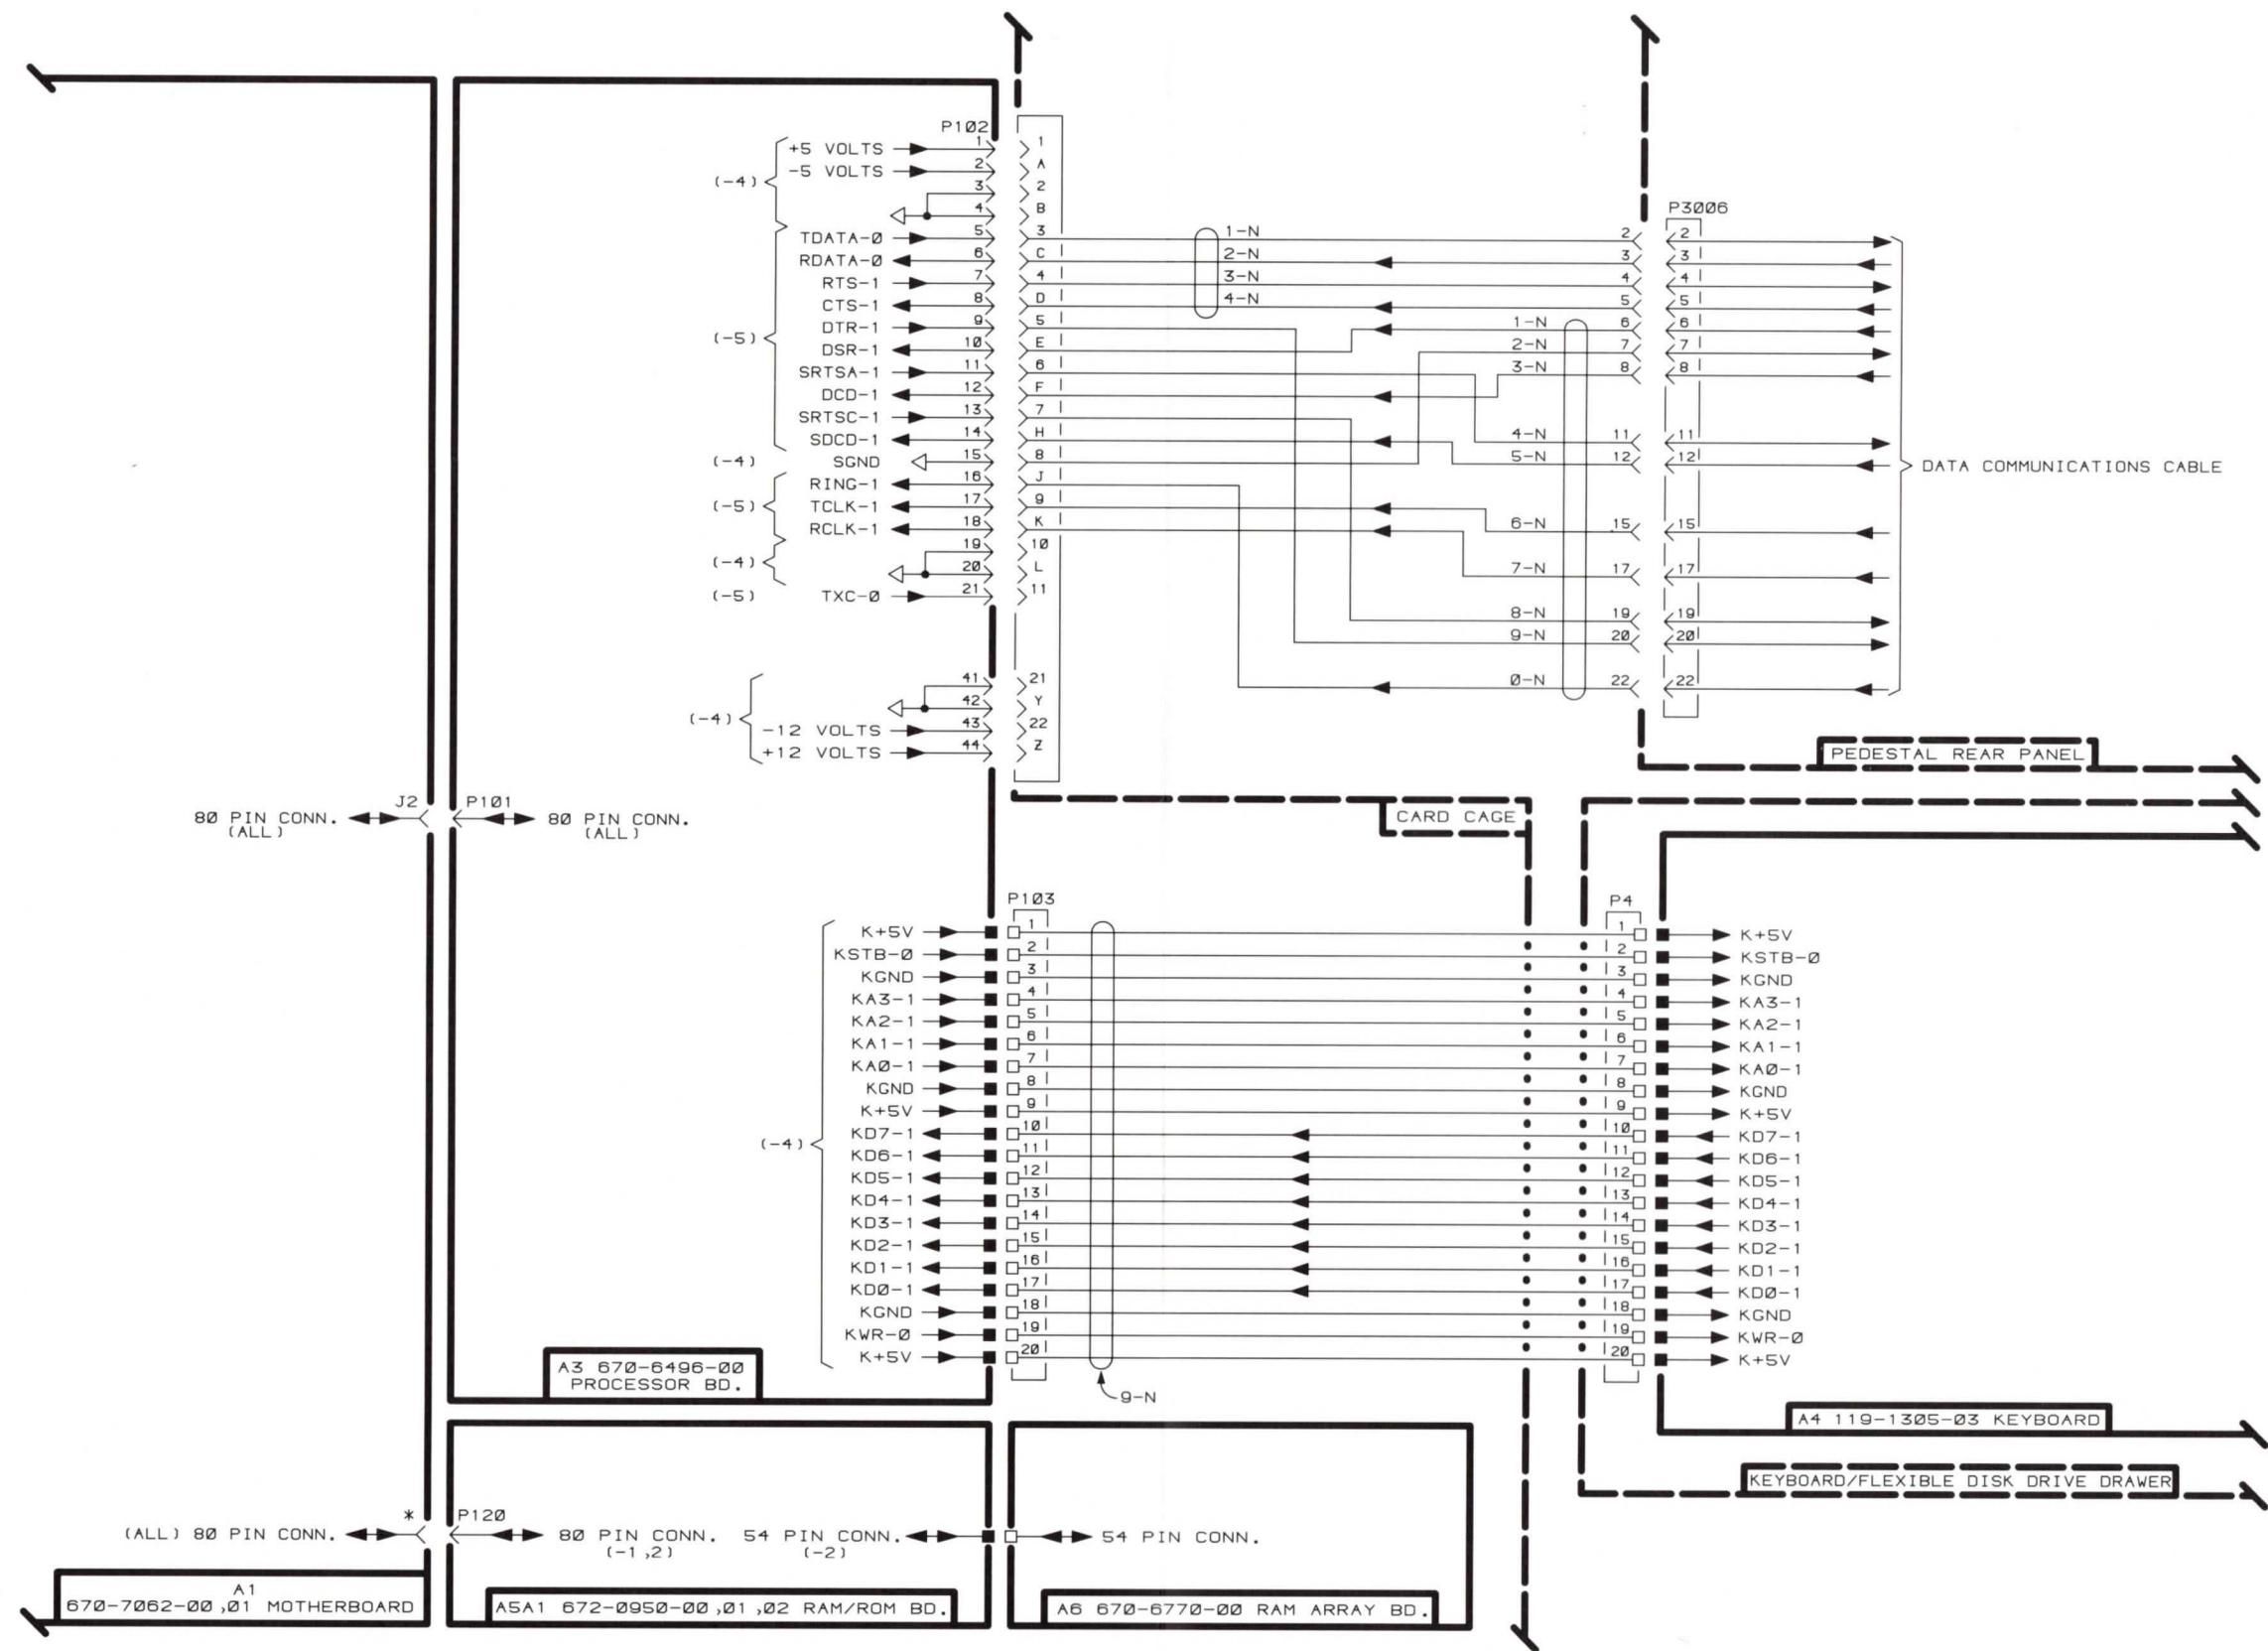

INTERCONNECT DIAGRAMS

- Power Supply Interconnect
- Motherboard Interconnect
- Motherboard Extender Interconnect
- Pedesal to Display and Power Display Interconnect
- Display Controller Interconnect
- RAM Controller Interconnect
- CRT Interconnect

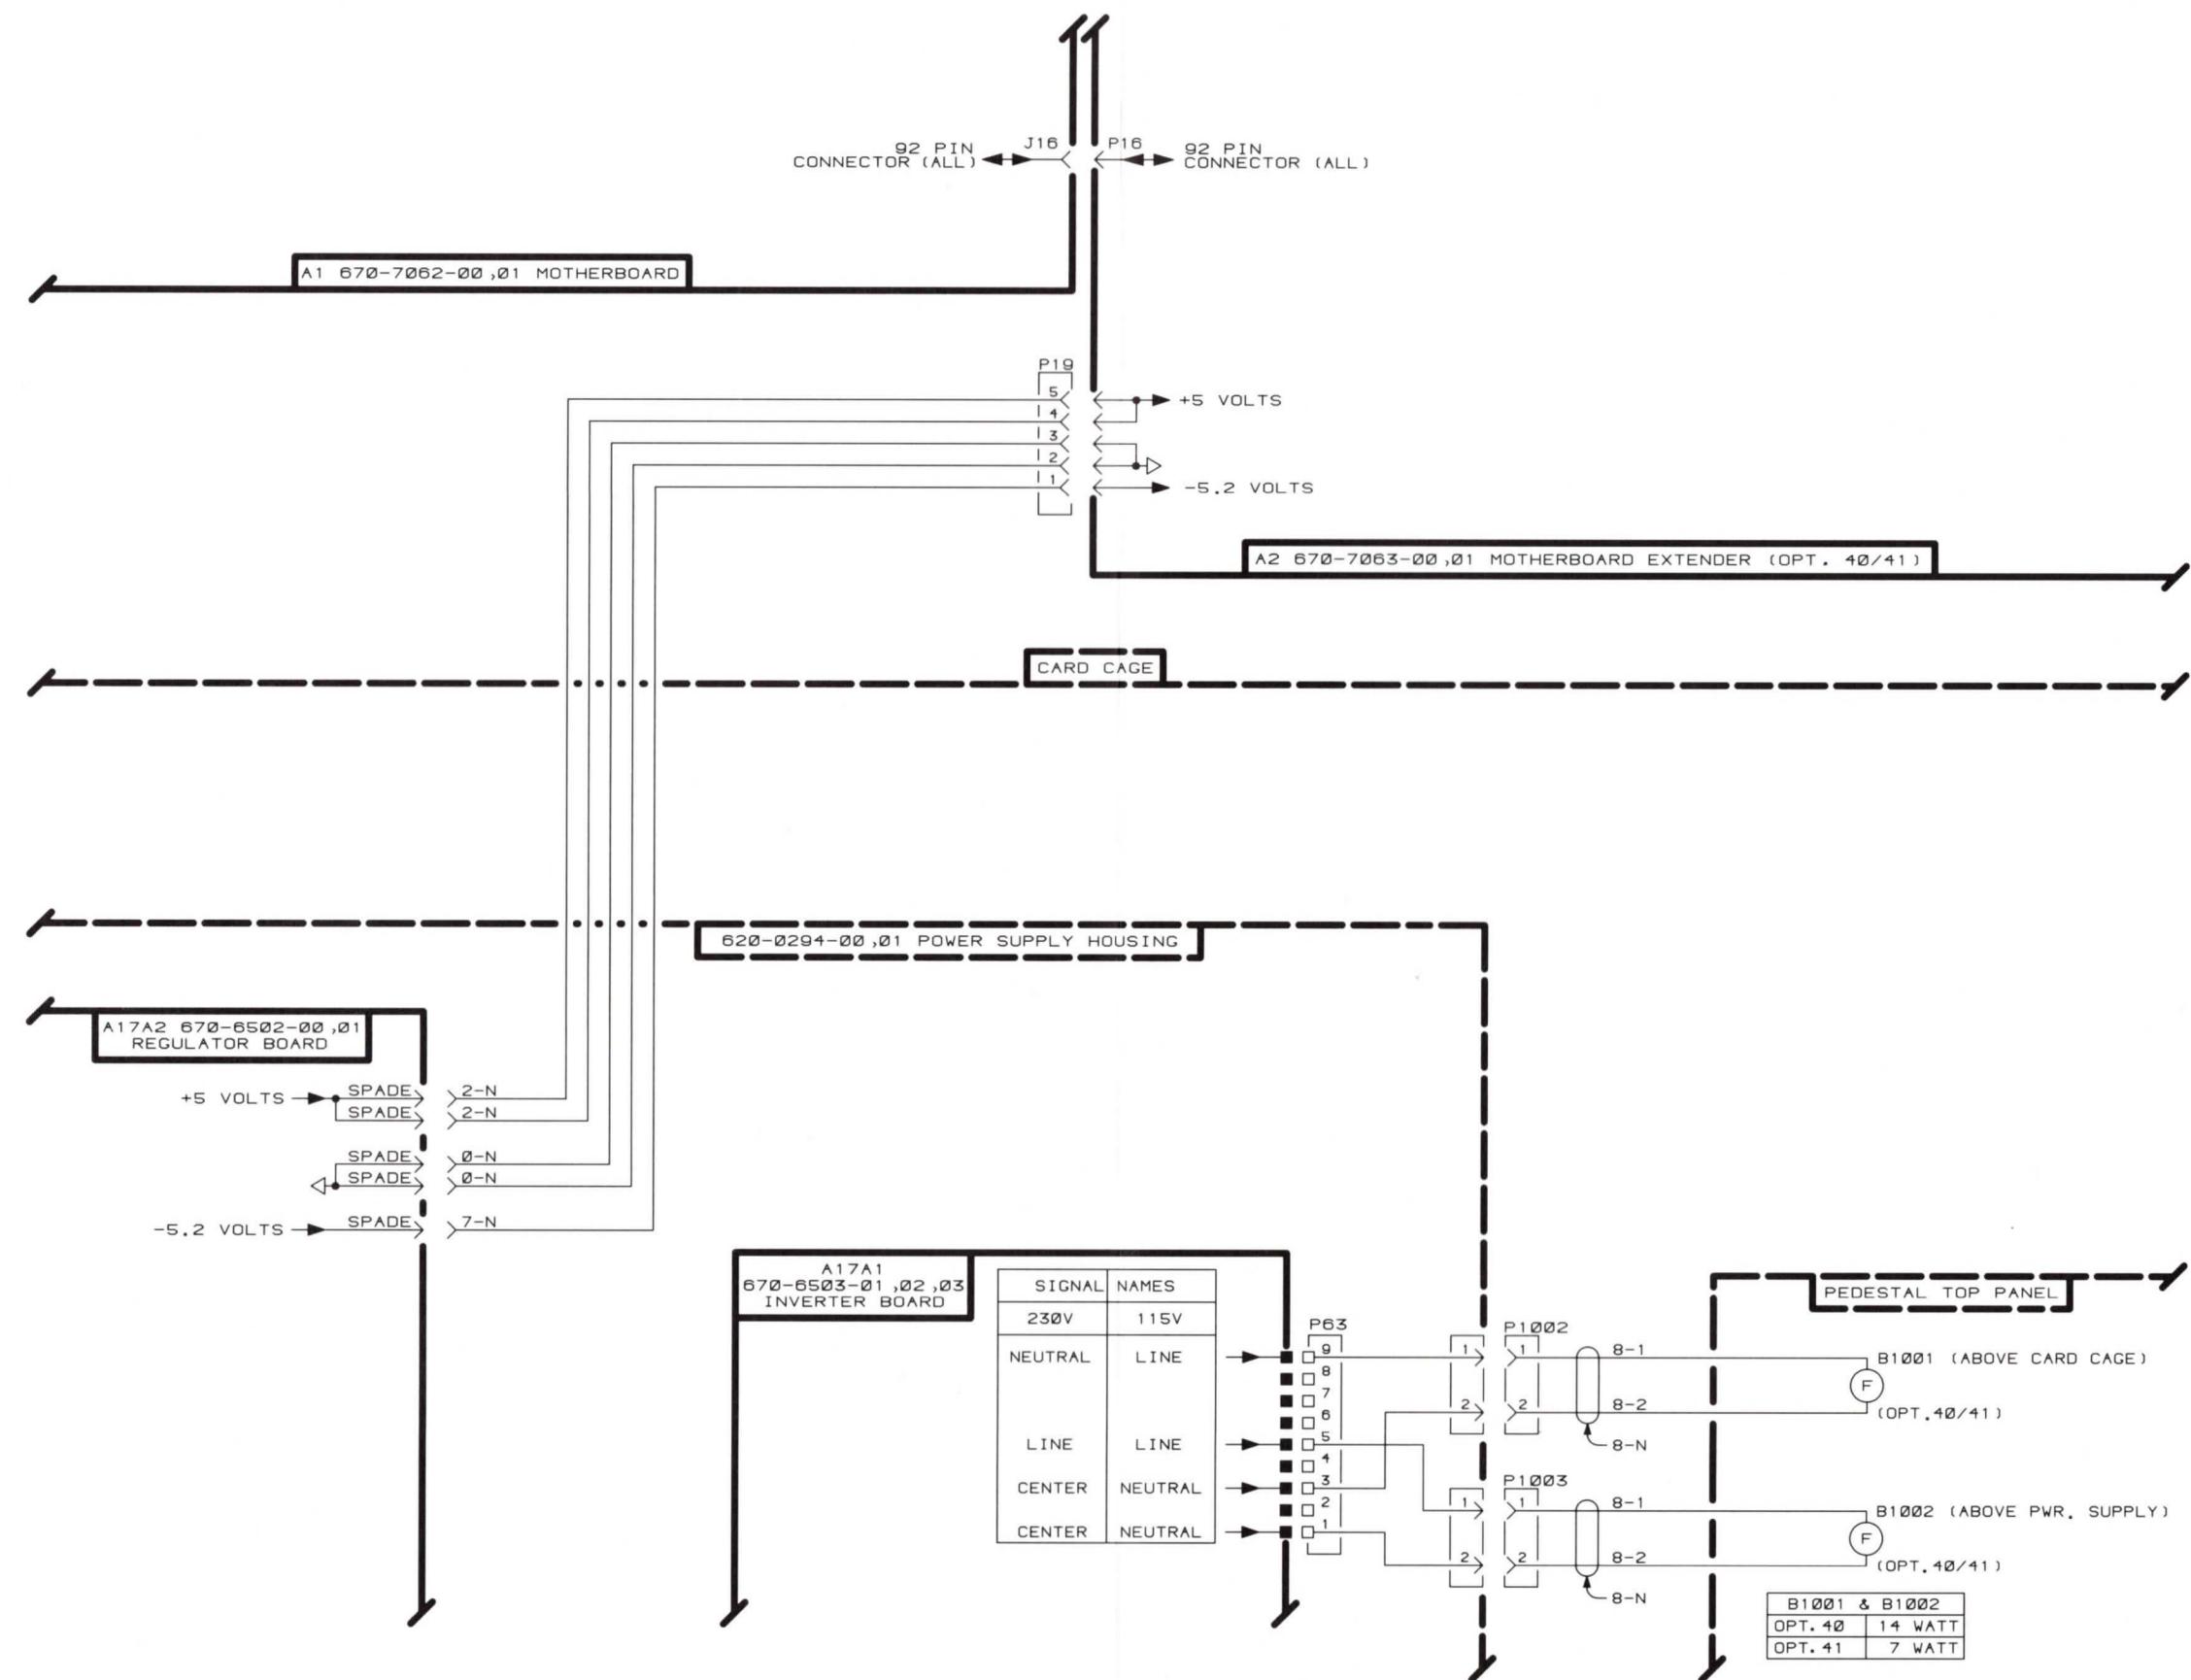

BLOCK DIAGRAMS

- Simplified Processor Board
- Processor
- Programmable Communications Interface
- Keyboard
- RAM/ROM
- High Efficiency Power Supply
- Power Supply Inverter
- Power Supply Regulator
- Power Supply Pulse Width Modulator
- Display Control Circuitry
- Display Controller Board
- Simplified Display Controller
- Vector Generator
- Simplified Vector Generator
- Display Module

Section 8

SCHEMATICS

Symbols and Reference Designators

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors = Values one or greater are in picofarads (pF).

Values less than one are in microfarads (μ F).

Resistors = Ohms (Ω).

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

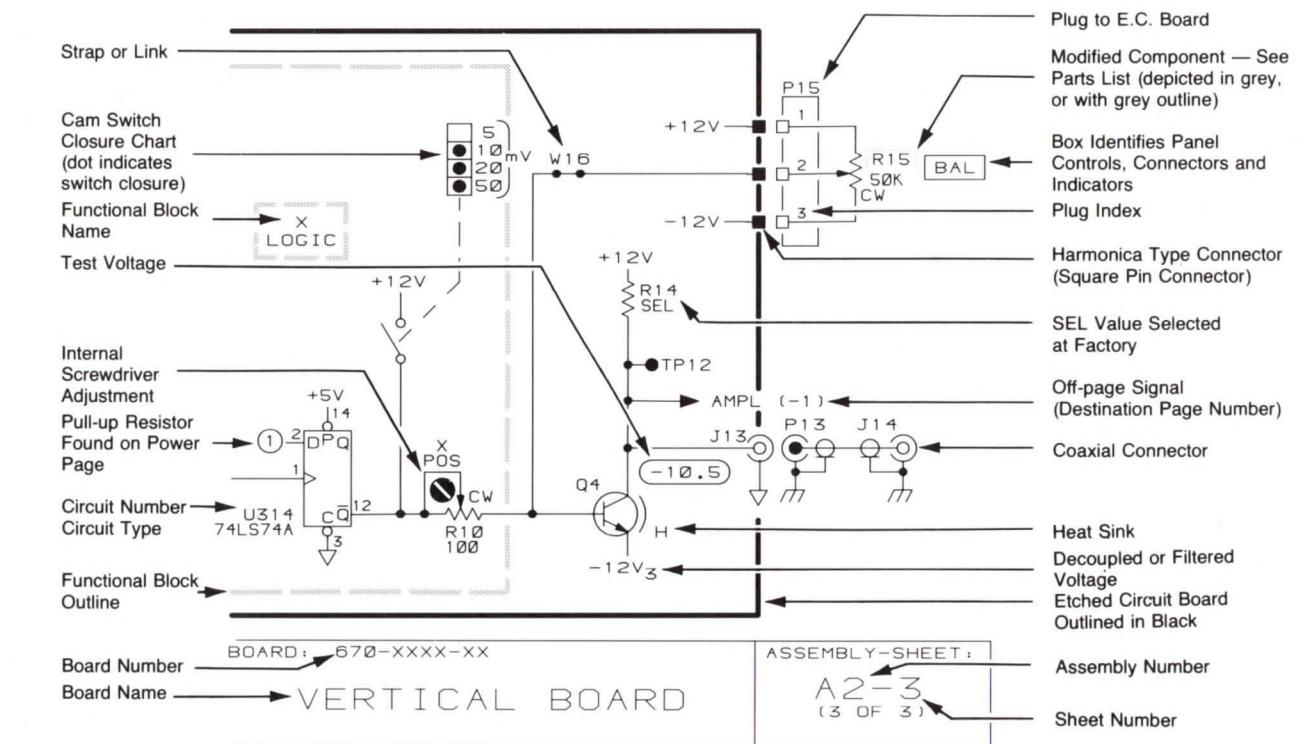

Abbreviations are based on ANSI Y1.1-1972. Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc., are:

Y14.15, 1966	Drafting Practices.
Y14.2, 1973	Line Conventions and Lettering.
Y10.5, 1968	Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

The following prefix letters are used as reference designators to identify components or assemblies on the diagrams.

A	Assembly, separable or repairable (circuit board, etc.)	H	Heat dissipating device (heat sink, heat radiator, etc.)	S	Switch or contactor
AT	Attenuator, fixed or variable	HR	Heater	T	Transformer
B	Motor	HY	Hybrid circuit	TC	Thermocouple
BT	Battery	J	Connector, stationary portion	TP	Test point
C	Capacitor, fixed or variable	K	Relay	U	Assembly, inseparable or non-repairable (integrated circuit, etc.)
CB	Circuit breaker	L	Inductor, fixed or variable	V	Electron tube
CR	Diode, signal or rectifier	M	Meter	VR	Voltage regulator (zener diode, etc.)
DL	Delay line	P	Connector, movable portion	W	Wirestrap or cable
DS	Indicating device (lamp)	Q	Transistor or silicon-controlled rectifier	Y	Crystal
E	Spark Gap, Ferrite bead	R	Resistor, fixed or variable	Z	Phase shifter
F	Fuse	RT	Thermistor		
FL	Filter				

The following special symbols may appear on the diagrams:

SCHEMATICS

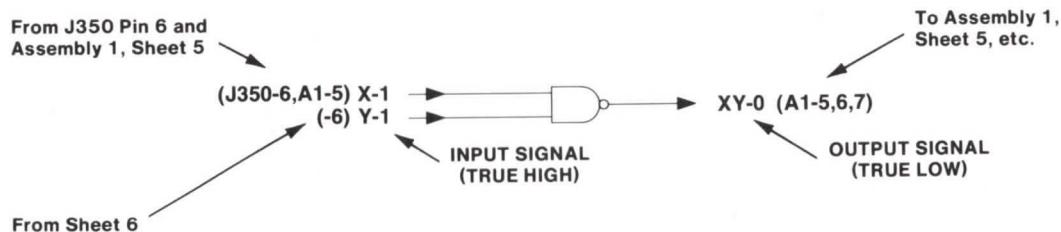

1. True High and True Low Signals

Signal names on the schematics are followed by -1 or a -0. A TRUE HIGH signal is indicated by -1, and a TRUE LOW signal is indicated by -0.

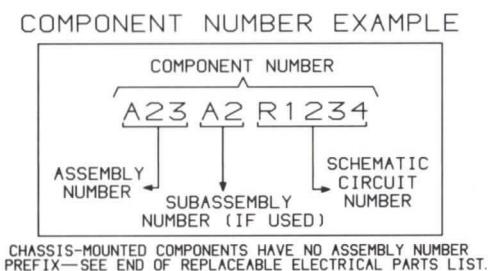

SIGNAL -1 = TRUE HIGH
SIGNAL -0 = TRUE LOW

2. Cross-References

Schematic cross-references (from/to information) are included on the schematics. The "from" reference only indicates the signal "source," and the "to" reference lists all loads where the signal is used. All from/to information will be enclosed in parentheses.

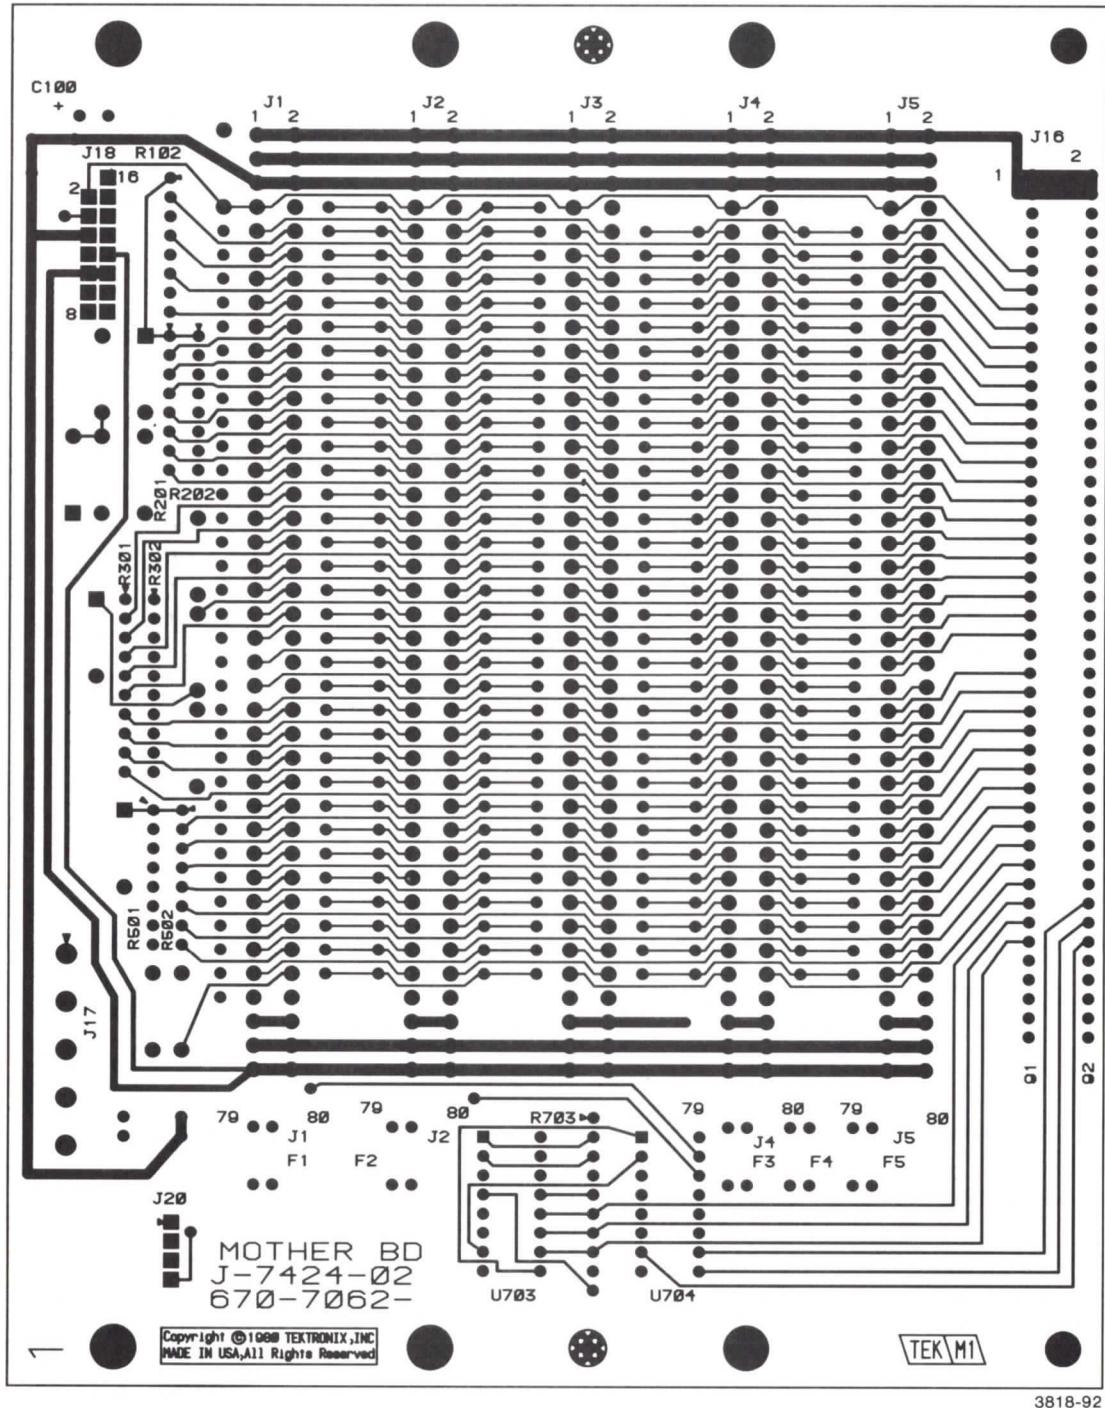

3. Component Number Example

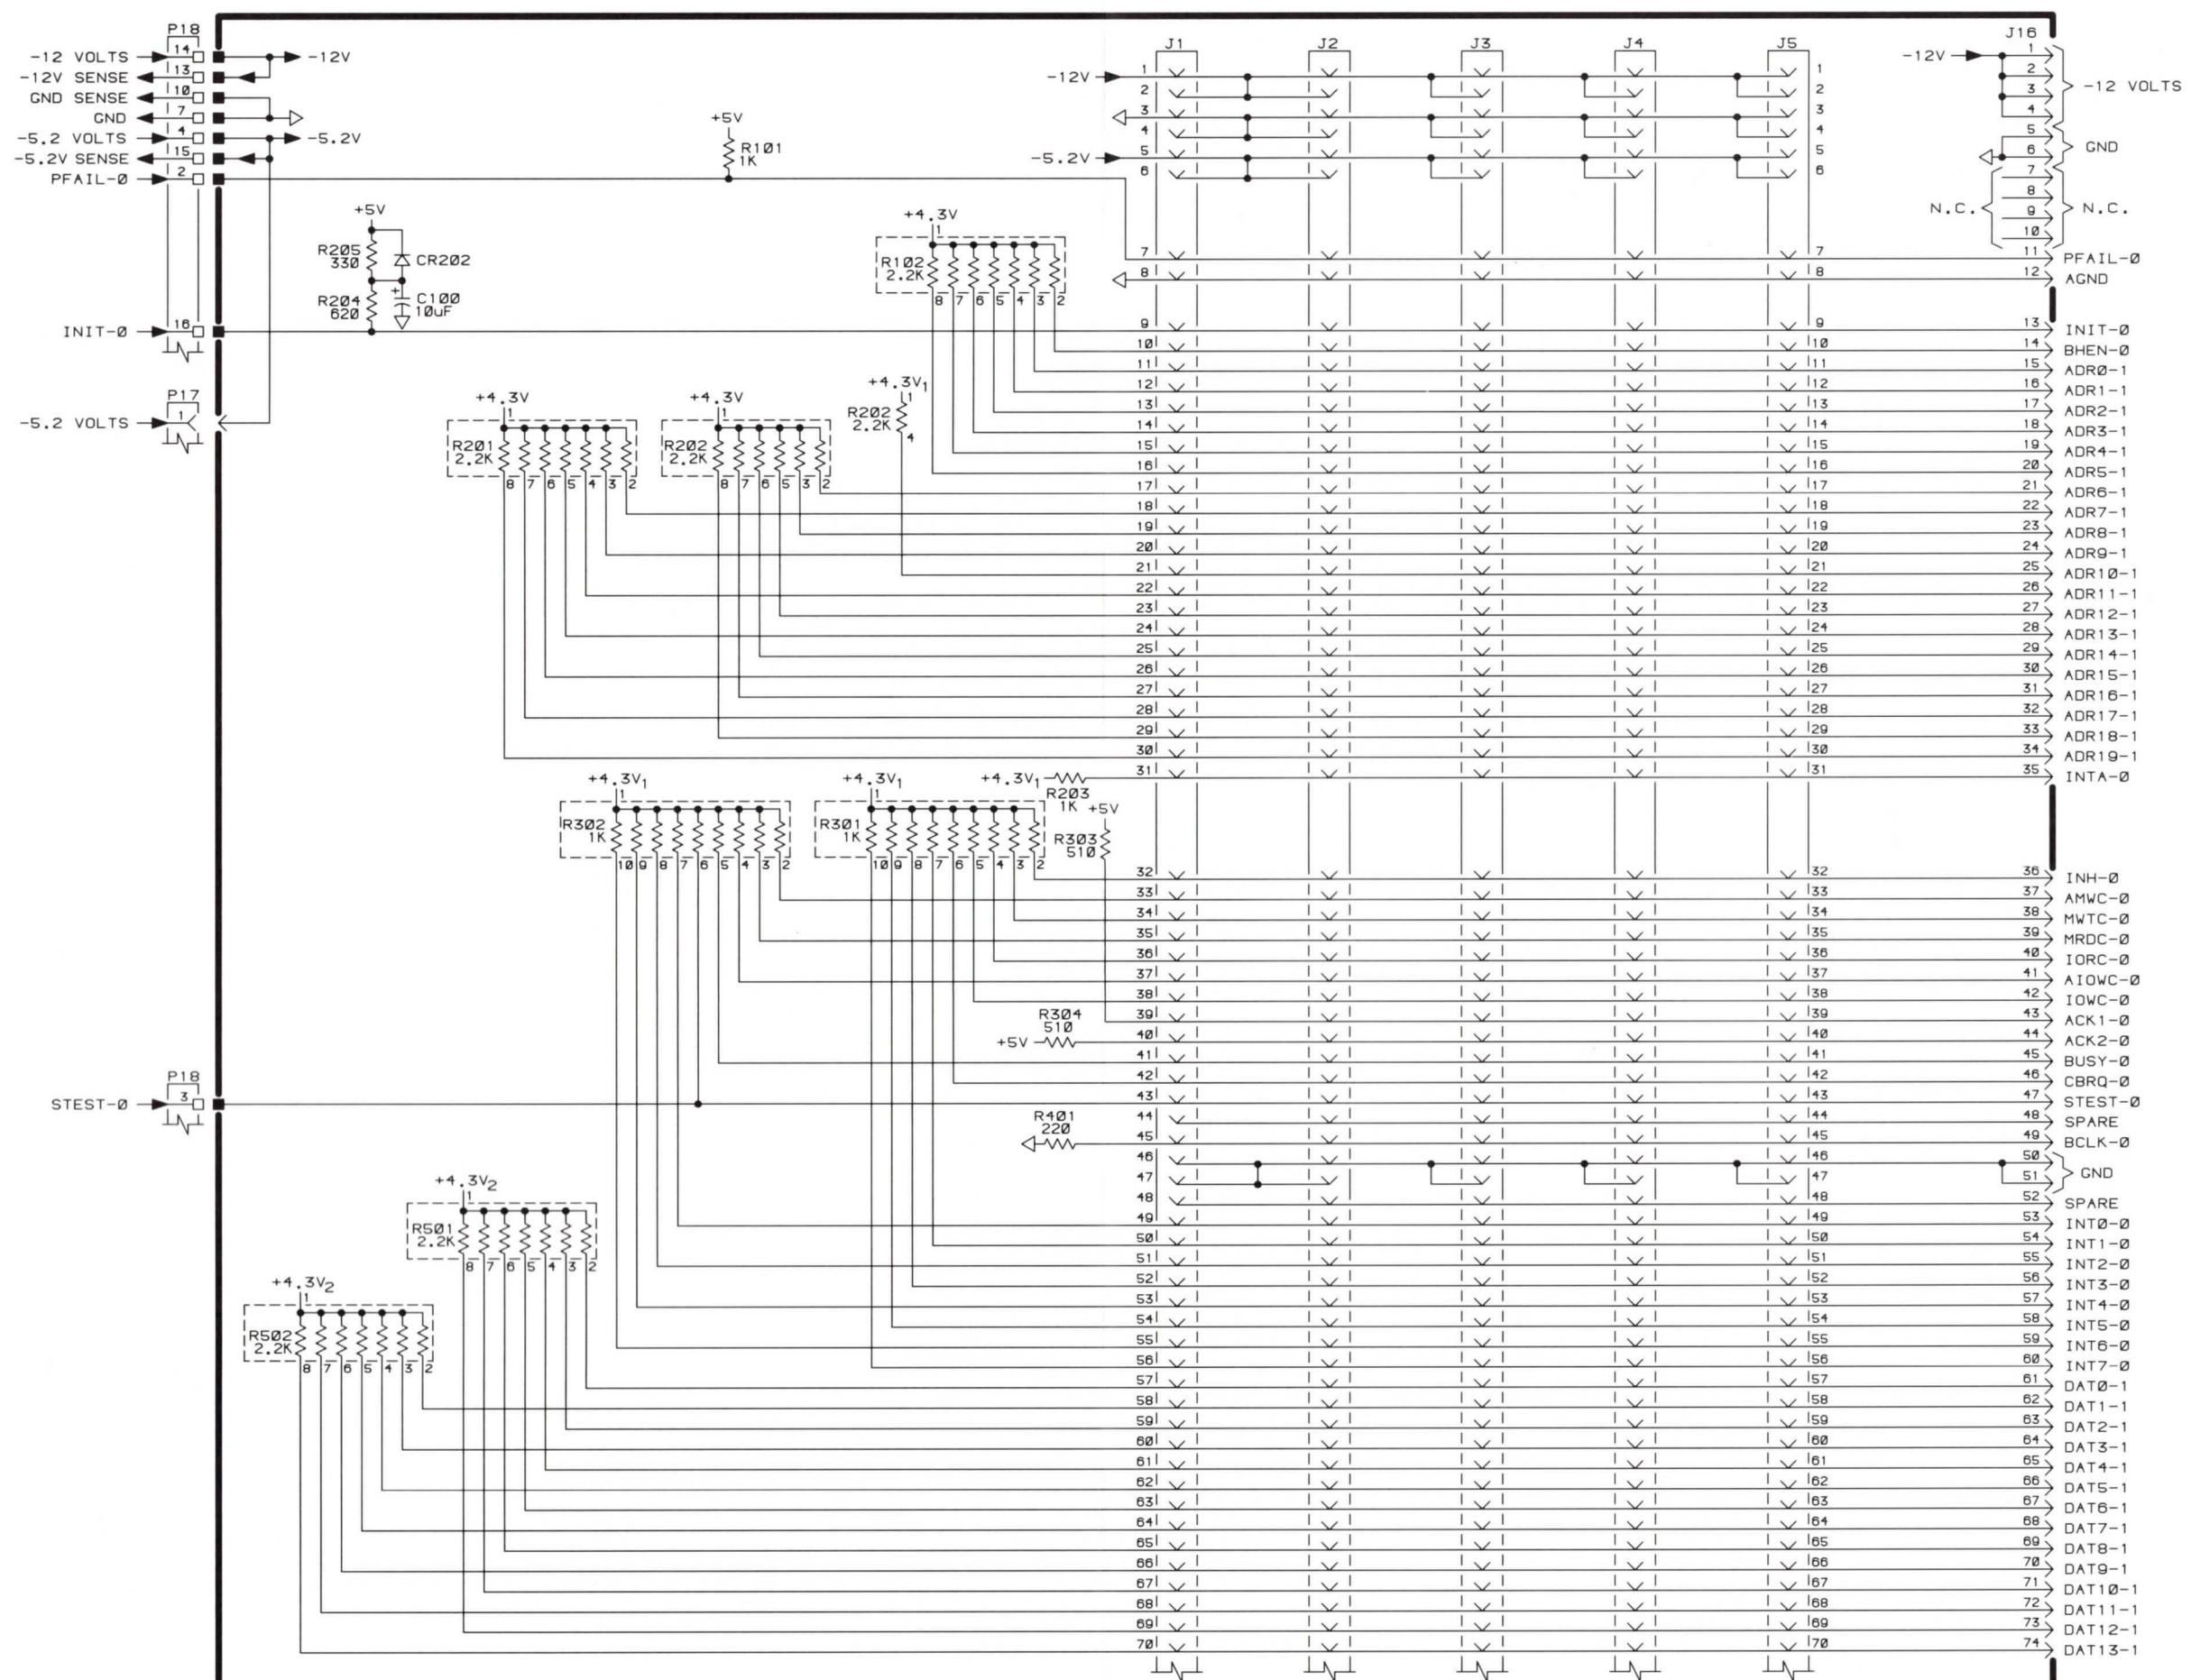

4114 SCHEMATICS

REPLACEABLE MECHANICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number

00X Part removed after this serial number

FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

1 2 3 4 5	<i>Name & Description</i>
	<i>Assembly and/or Component</i>
	<i>Attaching parts for Assembly and/or Component</i>

	<i>Detail Part of Assembly and/or Component</i>
	<i>Attaching parts for Detail Part</i>

	<i>Parts of Detail Part</i>
	<i>Attaching parts for Parts of Detail Part</i>

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol --- * --- indicates the end of attaching parts.

Attaching parts must be purchased separately, unless otherwise specified.

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

Appendix A

SIGNAL LIST

All named signals of the 4114 terminal are included in this alphabetical list. The first line of the entry under the "Explanation" column is an English-language description of the signal name mnemonic in the "Signal" column. There are two kinds of abbreviations used in the "Explanation" entries: abbreviations for blocks of circuitry named on the schematics and abbreviations for LSI integrated circuits.

Some signals on the Processor, RAM/ROM, and RAM Controller boards have the same names although they are not physically the same signals. They do, however, perform similar functions on their respective boards. Some instances are A0-19, CAS, and DINO-15.

Bus signals are designated by their alphabetic name to which is appended the least significant bit (LSB) separated by a hyphen from the most significant bit (MSB). An example is the Processor board address bus, A0-19. There are 20 lines (bits) in this bus. A0 is the LSB and A19 is the MSB.

PROCESSOR BOARD BLOCKS

ADE	Address Decoding	MPUC	Microprocessor Control
ADR	Address Drivers	MTG	MPU Timing Generator
BCD	Bus Command Driver	NVR	Non-Volatile RAM
BCG	Bus Clock Generator	PT&BRG	Programmable Timer & Baud Rate Generator
BTD	Bus Timeout Detector	ROMS	ROMs
BTL	Bus Transfer Logic	RCI	RS-232 Communications Interface
DD/R	Data Drivers/Receivers	RSCD	RS-232 State Change Detector
IC	Interrupt Controller	SI	Status Input
KC	Keyboard Controller		
MPU	Microprocessor		

LSI CIRCUITS

PIT	Programmable Interval Timer	PI MPU	Peripheral Interface Microprocessor
PIC	Programmable Interrupt Controller	DRC	Dynamic RAM Controller
MPU	Microprocessor	BC	Bus Controller

SIGNAL LIST

Signal	Source; Destination	Explanation	Signal	Source; Destination	Explanation
1STINTA-0	3-2; 3-1	First Interrupt Acknowledge. This Processor board signal indicates when the first of two interrupt acknowledge (INTA) cycles is occurring. Only the second INTA contains useful information.	AD0-19	3-1, 3-2; 3-2	(MPU) Address/Data (Bits 0 through 19). These signals are the time-multiplexed memory I/O address and data bus output from the MPU. These bits are also input for data.
A0-19	3-2; 3-3, 3-4, 3-5	(Local) Address (Bits 0 through 19). This is the Processor board address bus. It is created in the address drivers block from the MPU AD0-AD19 outputs. Note that some of these bits appear also on the RAM/ROM and RAM Controller boards with similar functions.	ADR0-19	3-2; P101	(System) Address (bits 0 through 19). These are the system bus address lines.
ABS-0	8-4; 9-5	Absolute Position. Indicates to the Vector Generator that an absolute positioning operation is in progress.	AIOWC-0	3-2; 3-1	Advanced IO Write Command. This signal gives system bus IO devices early indication of a write instruction. The timing is the same as a read command.
ACK1-0	3-1; 3-1	Acknowledge 1. This system bus signal can be used as a slave response for no MPU wait states. The Processor board uses ACK1 to terminate a bus data transfer when it detects a bus timeout condition from the BTD circuitry.	ALE-1	3-2; 3-1, 3-3	Address Latch Enable. ALE-1 strobes an address into the ADE block. It also synchronizes the Microprocessor Timing Generator, and DEGLITCHES the ROM bank decoder.
ACK2-0	5-1; 3-1	Acknowledge 2. ACK2 serves as an advanced transfer acknowledge to eliminate WAIT states in the MPU. The signal derives from SACK-0 which is output by the timing and control block inside the dynamic RAM controller. SACK-0 indicates the beginning of a memory access cycle.	AMWC-0	3-2; 3-1	Advanced Memory Write Command. AMWC-0 gives early indication of a write instruction to the system bus memory. The timing is the same as a read command — MRDC.
			ANODE	18-1; 19-1	(crt) Anode. Passes through a current limiting resistor in the Hard Copy Amplifier board to the anode of the crt.

Signal	Source; Destination	Explanation
ANTIBURN	14-2; 17-1	Antiburn. (Made up from LA and SA ANTIBURN signals on schematic.) If positive, decreases the Z-Axis amplifier drive, reducing the CRT writing beam intensity. Goes positive when deflection approaches zero velocity.
AWT-0	3-1; 3-2, 3-4, 3-5	Advanced Write. This is the advanced write command to all on-board devices. AWT is derived from the MPU status lines and the Microprocessor Timing Generator.
BANKIN-0	7-2; 7-1	Bank In. BANKIN is used in the address decoding logic on the RAM Controller board to indicate the presence or absence of a RAM Array board.
BBCLK-1	3-1; 3-5	Buffered Bus Clock. BBCLK is a 4.9152 MHz signal which synchronizes the bus transfer logic and is the frequency source for the Programmable Timer and (Transmit) Baud Rate Generator block.
BCLK-0	3-1; 3-1	Bus Clock. BCLK is the system bus clock. It is a 4.9152 MHz square wave and is used by bus devices to synchronize bus master transfers. It is also used as a stable frequency source.

Signal	Source; Destination	Explanation
BHEN-0	3-2; P101	Byte High Enable. On the Processor board, ULBHEN is latched and then driven onto the system bus as BHEN. BHEN enables the high byte — D8-15 — on read, write, and interrupt acknowledge cycles.
BPRN-0	1-2; 3-1	Bus Priority In. BPRN is a signal from the bus priority logic on the Motherboard that informs a potential bus master board that it has permission to become bus master.
BREQ-0	3-1; P101	Bus Request. BRQ is a signal from a potential bus master board to the bus priority logic on the Motherboard that indicates that the potential bus master board needs to become the actual bus master.
BRITE-0	8-4; 16-1	Brite. A TTL low from the Display Controller activates BRITE Intensity adjustable by R415 in the Intensity Control Logic. In combination with low level on DEFOCUS-0, the BRITE-DEFOCUS mode is useful for displaying wide vectors.

SIGNAL LIST

Signal	Source; Destination	Explanation
BUSAEN-0	3-1; 3-2	BUS Address Enable. BUSAEN indicates that a board is bus master of the system bus. BU-SAEN is input to the AEN input of the bus controller IC. AEN enables the bus controller to output the bus commands MRDC, MWTC, AMWC, IORDC, etc. BU-SAEN is gated with INTA and input to the INTA input of the PIC.
BUSGRT-1	3-1; 3-5	Bus Grant. This signal is similar to BUSAEN, but has a slight timing difference.
BUSY-0	3-1; 3-1	(Bus) Busy. BUSY indicates that a bus master is currently using the system bus. BUSY delays bus master transfer until the current bus master is done.
CAS-0	7-1; 7-2 5-1; 5-2, 6-1	Column Address Strobe. This signal is generated by the DRC on both the RAM/ROM and the RAM Controller boards. CAS strobes the seven multiplexed column address bits appearing on RA0-6 into the RAMs on the RAM Array board.
CATHODE	18-2; 19-1	(crt) Cathode. Ties cathode of crt to ground.

Signal	Source; Destination	Explanation
CBRQ-0	3-1; 3-1	Common Bus Request. CBRQ is used by potential bus masters to request bus mastership from higher priority bus masters. CBRQ is generated by the Processor board along with BRQ. The Processor board also listens to CBRQ and gives up the bus when another board asserts CBRQ.
CCEN-1	9-1; 9-2	Completion Counter Enable. Enables Completion Counter during vector generation.
CE1 & CE2	18-2; 19-1	Collimation Electrodes, 1 and 2. The collimation electrodes, CE1 and CE2, are electronic lenses that cause a uniform flood gun beam pattern over the target.
CENTER-0	15-1; 14-1	Centering. When low, it inhibits and resets the operation of the Origin Shift Counter. (not used in the 4114 display)
CLK-1	3-1; 3-2	Clock. CLK is a direct output of the Clock Generator IC. It outputs a 4.9152 MHz square wave with a one third duty cycle. All blocks that must be synchronized with the local processor bus use this signal.

Signal	Source; Destination	Explanation
CLKDIS-0	P129; 5-1 P166; 7-1	Clock Disable. A TTL logic low level applied to this input pin disables the clock circuitry on the RAM/ROM or the RAM Controller board. (This is a test point for factory use only).
CMD-1	3-4; 3-5	Command. CMD is the logical OR of RD and AWT on the Processor board.
COMINT-0	3-5; 3-2	Communications Interrupt. COMINT is the RS-232 Communications Interface received character interrupt signal. Other RS-232 interrupts are included in the TIMERINT signal.
CTS-1	P102; 3-5	Clear To Send. CTS is an RS-232 status input.
CUTX-0	9-3; 9-5	Cut X (axis). Cuts off CRT beam when scissoring occurs in the X axis.
CUTY-0	9-4; 9-5	Cut Y (axis). Cuts off CRT beam when scissoring occurs in the Y axis.
CX0-11	9-3; 9-2	X Shift Register Data. Parallel load data for X Counter.
CY0-11	9-4; 9-4	Y Shift Register Data. Parallel load data for Y Counter.

Signal	Source; Destination	Explanation
D0-15	3-2; 3-3, 3-4, 3-5	(Local) Data (Bus). These lines are the local data bus for the Processor board.
DAT0-15	3-2; P101, 8-3	(System) Data (Bus). These lines are the system data bus.
DBUSY-0	18-1; 8-1, 8-2, 8-3, 8-4, 9-2	Display Busy. When low, it indicates that the display is busy in HOLD mode, erasing the screen, or in Hard Copy operation. This line states that the monitor is busy and cannot accept further information until brought out of one of these modes.
DCD-1	P102; 3-5	Data Carrier Detect. DCD is an RS-232 status input.
DCLK-1	9-1; 8-4	Dot (or dash) Clock. Clock for dot (or dash) pattern.
DCZ-1	9-2; 9-1	Displacement Counter Zero. Indicates that the displacement between characters is either completed or not to be done.
DD0-15	8-3; 9-1, 9-3	Display Data Bits 0 to 15. Sixteen bits of data transferred between the Display Controller and the Vector Generator (or optional board).

SIGNAL LIST

Signal	Source; Destination	Explanation
DEFO-CUS-0	8-4; 16-1	Defocus. When low, the focus of the crt writing beam is reduced, producing a slightly wider trace (defocused). When high, the writing beam is focused. The use of the DEFO-CUS-0 signal line allows a focused or defocused crt writing beam when used in combination with WRITE-THRU, BRITE, and NORMAL.
DIN0-15	5-2; 6-1 7-2; 6-1	Data In Bits 0 through 15. During RAM write operations, these 16 data bits contain the data that is written into RAM on the RAM Array board.
DINLSB-0	7-1; 7-2	Data Input Enable Least Significant Byte. During RAM write operations, DINLSB enables the data input buffer for the least significant byte of data to drive data from the bus onto RAM data lines DIN0-7 to the RAM Array boards.
DINMSB-0	7-1; 7-2	Data Input Enable Most Significant Byte. During RAM write operations, DINMSB enables the data input buffer for the most significant byte of data to drive data from the bus onto RAM data lines DIN8-15 to the RAM Array boards.
DIS. SIZE IN.	J5005; HCU	Display Size Information. Tied to ground (logical low). When tied low, it informs the hard copy unit that it is scanning a 19 inch display.

Signal	Source; Destination	Explanation
DOUT-0	7-1; 7-2 5-1; 5-2	Data Output Enable. During RAM read operations, DOUT enables the Data Output Latches to output their data to the system bus.
DOUT0-15	6-1; 5-2 6-1; 7-2	Data Output Bits 0 through 15. These 16 data bits from the RAM Array board contain the RAM data output bits during RAM read operations.
DPC	9-2; 15-1	Display Power Control. Causes display ac power to be turned on. 10mA at + 9 to + 12 V.
DS-1	9-1; 9-1	Data Shift. Indicates the data in the shift registers is not normalized and requires shifting.
DSCAL-0	9-1; 9-2	Delayed Scale. Scale signal for vector being set up.
DSR-1	P102; 3-5	Data Set Ready. DSR is an RS-232 status input.
DT-1/R-0	3-2; 3-4	Data Transmit/Receive. DT-1/R-0 is a direct output of the bus controller. A high on this line indicates a WRITE to IO or memory and a low is a READ.
DTR-1	3-5; P102	Data Terminal Ready. DTR is an RS-232 status output.

Signal	Source; Destination	Explanation
DYNAMIC FOCUS	15-1; 16-1	Dynamic Focus. This signal modifies the focus electrode voltage to maintain a consistently focused writing beam over the display screen.
ERASE TRIGGER	13-1; 13-2	Erase Trigger. Triggers the crt to erase via ERASE-0 line.
ERASE-0	8-2; 13-1	Erase. Initiates the erase cycle in the storage board circuits. Erases the crt. Must be greater than 2 μ s. A READ-0 or WAIT-0 signal prevents erasure during hard copy operation.
FAST RAMP	HCU; 14-1	Fast Ramp. Analog deflection voltage from the HCU which controls the vertical deflection during the hard copy scan. (There are "+" and "-" FAST RAMPS on the schematics.)
FG FIL	16-1; 19-1	Flood Gun Filaments. Flood Gun filaments (\pm FG FIL on schematic) of crt. Driven by \pm 15 v from low voltage power supply.
GBSY-1	8-4; 9-1	Generator Busy. Vector generator is not ready to accept new vector data.

Signal	Source; Destination	Explanation
GBSY	8-4; 18-1	Generator Busy. Optional signal that can be used to reset the view erase counters. A 100 ns or greater pulse is required. A VIEW-0 signal also resets the view erase counters. (There is a view reset strap option between GBSY and Z-AXIS.)
GRUN-1	9-2; 8-4	Generator Running. Vector generator is drawing a vector.
HC INTEN-SITY	HCU; 17-1	Hard Copy Intensity. Controls the crt writing beam intensity by adjustment of R228 (Hard Copy intensity adjustment).
HCS-0	18-1; 17-1	Hard Copy Scan. Enables operation of Hard Copy circuitry. HCS-0 is asserted by either READ-0 or WAIT-0 (from the hard copy unit) going low. Initiates crt scan by the HCU.
HCS-1	18-1; 18-2, 19-1	Hard Copy Scan. Inverted HCS-0. Enables operation of Hard Copy circuitry. Refer to signal HCS-0.

SIGNAL LIST

Signal	Source; Destination	Explanation
HCU-0	HCU; 8-2	Hard Copy Unit. Indicates to the display controller that the Hard Copy Unit is capable of accepting a MAKECO-PY-0 request.
HOLD-0	18-1; 14-1	Hold. Connects the channel switch to a separate set of inputs that are connected to ground when Hold mode is initiated. The grounded inputs prevent beam deflection and assure minimum deflection amplifier power dissipation during Hold mode. (Strap option on Deflection Amplifier board, operational in the IN position.)
IN-0	5-2; 6-1	In. IN is used with OUT to indicate the presence or absence of a RAM Array board.
INH-0	---; 5-1	(Read) Inhibit. When true low, INH inhibits memory circuitry from outputting its data onto the system bus during a read operation of the memory circuitry. See INHIBIT. INH may be output by test circuitry. Currently not used.

Signal	Source; Destination	Explanation
INHIBIT-0	5-1; 5-3	Inhibit. This signal is a buffered version of the system bus signal INH. This signal, when true low, inhibits the RAM/ROM board from outputting its data during RAM read or ROM read operations.
INIT-0	17-1; 3-1, 3-4, 9-1	Initialize. INIT is used to generate reset which goes directly to the MPU and does a power-up reset operation. It also resets much of the sequential logic on the Processor board.
INT0-7	P101; 3-2	Interrupt 0 through 7. INT0—7 are interrupt request signals to the Processor board. INT0,4, or 5 can be generated by Processor board devices.
INTA-0	3-2; 3-1, 3-2	Interrupt Acknowledge. INTA is generated on the Processor board and is received by slave PICs on other boards. INTA notifies the slave PIC that its interrupt is acknowledged and it can put vectoring data on the System data bus.

Signal	Source; Destination	Explanation
INTER-0	HCU; 17-1	Interrogate. This is the hard copy interrogate pulse from the hard copy unit (HCU). As a result the crt writing beam is pulsed (100 ns pulse width) and a target information signal, TARSIG-0 is developed.
INTR-1	3-2; 3-1	Interrupt. INTR is a direct output of the INT pin of the PIC in the IC block. The signal is input directly to the MPU INTR input. INTR is the interrupt to the MPU.
IORC-0	3-2; 3-1	IO Read Command. This signal, when low, indicates that an IO device should drive its data onto the system bus.
IOWC-0	3-2; P101	IO Write Command. This signal, when low, indicates that an IO device should read data on the system bus.
KA0-3	3-4; P103	Keyboard Address 0 through 3. These signal lines carry key matrix column addresses in addition to LED address and on-off information.

Signal	Source; Destination	Explanation
KD0-7	4-1; 3-4	Keyboard Data 0 through 7. These lines carry key matrix data in addition to thumbwheel Grey code data.
KBDINT-0	4-1; 3-2	Keyboard Interrupt. This signal is the interrupt for the keyboard. It is output from Pin 24 of the PIMPU and input to the IC block as INT4 into the PIC.
KBT3-1	P104; 3-4	Keyboard Test. KBT is the test input to the KC MPU Keyboard Controller.
KSTRB-0	3-4; 4-1	Keyboard Strobe. KSTRB latches KA0-KA3 data into the Keyboard board circuitry.
KWR-0	3-4; 4-1	Keyboard Write. KWR latches KA0-KA3 into the Keyboard circuitry that controls the LEDs.
LBHE-0	3-2; 3-4	Latched Byte High Enable. LBHE is the Processor board equivalent of the system bus signal, BHEN.
LCNT-0,-1	9-1; 9-3, 9-4	Load Count. Enables counter parallel load.

SIGNAL LIST

Signal	Source; Destination	Explanation
ORIGIN-1	18-1; 14-1	Origin. During erase cycle from Storage board, triggers the origin shift counter on the Deflection Amplifier board to shift the axes slightly on the next page of screen written data. Feature increases crt screen life.
OUT-0	6-1; 5-2 6-1; 7-2	Out. OUT is used with IN to indicate the presence or absence of a RAM Array board.
OUT0-1	3-5; 3-1	Output 0. OUT0 is the output of a 16-bit programmable down counter. This provides variable timing delays for the system firmware. In the BTD block, it clocks the bus timeout counter whose output to the system bus is ACK1.
PD-0,-1	9-5; 9-5	Pump Down. X axis current switch signal.
PL-0,-1	9-5; 9-5	Pump Left. Y axis current switch signal.
PR-0,-1	9-5; 9-5	Pump Right. Y axis current switch signal.
PU-0,-1	9-5; 9-5	Pump Up. X axis current switch signal.
QS1-2	3-1; J104	Queue Status 1 and 2. QS1—2 are direct outputs of the MPU that are not used on the Processor board.

Signal	Source; Destination	Explanation
RA0-6	5-1;5-1 7-1; 7-2	RAM Address Bits 0 through 6. These signals contain the seven multiplexed row and column addresses from the DRC to the dynamic RAMs on the RAM Array board.
RAM-WRITE-0	5-1; 5-2	RAM Write. RAMWRITE indicates to the DRC and the data input receivers on the RAM/ROM board that a RAM write operation has been requested.
RAS-0	5-1; 5-2	Row Address Strobe. RAS is generated by the DRC on the RAM/ROM board. RAS strobes the seven multiplexed row address bits appearing on RA0-6 into the RAMs on the RAM Array board.
RAS0-3	7-1; 7-2	Row Address Strobe 0 through 3. These signals are generated by the DRC on the RAM Controller board. RAS0-3 strobe the seven multiplexed row address bits appearing on RA0-6 into the RAMs on the appropriate RAM Array board (RAM Bank 0 through 3).
RCLK-1	P102; 3-5	Receive Clock. RCLK is an RS-232 external clock signal generated by a modem or other external device. RCLK can be used to clock data into the Processor board's UART.

Signal	Source; Destination	Explanation
RD-0	3-1; 3-2, 3-4, 3-5	Read. If RD is low, it indicates that the MPU is performing an IO or memory read cycle, either to the local or system bus.
RDATA-1	P102; 3-5	Receive Data. RDATA is the RS-232 serial data input from a modem or other external device to the Processor board.
RDY-1	J104; 3-1	Ready. RDY is the MPU RDY signal output to test connector J104.
RDYAND-0	J104; 3-1	Ready And. RDYAND is an input from a test device connected to J104 that can disable the RDY line to the MPU, causing the MPU to enter a WAIT state.
RDYOR-0	J104; 3-1	Ready Or. RDYOR is an input from a test device connected to J104 that can activate the RDY line to the MPU, causing the MPU to exit a WAIT state.
READ-0	5-1; 5-3	Read. READ is the buffered version of the system bus signal MRDC.

Signal	Source; Destination	Explanation
READ-0	HCU; 18-1,-14-1	Read. Develops HCS-0 and HCS-1 in the copy control section. READ-0 causes the channel shift and origin shift to use the SLOW and FAST RAMP signals (also from the HCU) to provide LA and SA outputs from the Deflection Amplifier.
RELX-0,-1	9-1; 9-1	Relative X Axis. The vector operation is relative in the X axis.
RELY-0,-1	9-1; 9-1	Relative Y Axis. The vector operation is relative in the Y axis.
REMOTE COPY-0	8-2; HCU	Remote Copy. Caused by Display Controller switch going low. Initiates a hard copy cycle (makes a copy). A direct line from the MAKE COPY-0 signal, which acts as a reference for the Hard Copy Unit. Informs the HCU that it is being triggered from a source remote to the HCU.
RING-1	P102; 3-5	Ring. RING is an RS-232 status input indicating that an auto-answering modem is ringing.

SIGNAL LIST

Signal	Source; Destination	Explanation
ROM-READ-1	5-3; 5-1	ROM Read. ROMREAD indicates that a ROM read operation is in progress. This signal is used to generate an acknowledge signal (ACK1 or ACK2) to the bus master.
RQ-0/GT [0/1]	3-1; J104	Request/Grant. RQ/GT0 is the local MPU bus request/grant signal. It is available to J104 test connector, but is not used on-board.
RSCNT-0	9-1; 9-2	Reset Count. Clears completion shift register for new shift data.
RST-0	3-1; 3-2, 3-4, 3-5	Reset. RST-0 is RST-1 inverted.
RST-1	3-1; 3-2, 3-4, 3-5	Reset. RST is derived from the system bus signal INIT and is synchronized to the MPU clock. RST resets the MPU and other devices on the Processor board.
RTS-1	3-5; P102	Request To Send. RTS is an RS-232 signal generated by the RCI block on the Processor board.
RXSGN-0	9-1; 9-3	Reset X Sign. Clears X sign bit between vectors.

Signal	Source; Destination	Explanation
S0-2	3-1; 3-2	Status 0 through 2. These status lines have eight states taken together and indicate whether an interrupt acknowledge read IO, write IO, halt, code access, read memory, or write memory is occurring. The bus controller IC in the BCD block interprets the S0, S1, and S2 signals and outputs INTA, IOWC, AIOWC, IORC, MRDC, MWTC, AMWC.
S7-1/ BHE-0	3-1; 3-2	Status 7/Byte High Enable. This signal is interpreted as BHE during the MPU state T1. It enables D8–D15 onto the local data bus. During T2, T3, or T4 this signal is interpreted as S7.
SCAL-0	8-3; 9-1	Scale Enable. Enables the vector scaling logic.
SDCD-1	P102; 3-5	Secondary Data Carrier Detect. SDCD is the RS-232 secondary data carrier detect signal.
SHEN-1	9-1; 9-3, 9-4	Shift Enable. Enables the X and Y Shift Registers.
SHFTX-1	9-1; 9-3	Shift X Axis. Shifts X data.

Signal	Source; Destination	Explanation
SHFTY-1	9-1; 9-2, 9-4	Shift Y Axis. Shifts Y data.
SLOW RAMP	HCU; 14-1	Slow Ramp. Analog deflection voltage from the HCU which controls the horizontal deflection during the hard copy scan. (There are "+" and "-" SLOW RAMPs on the schematics.)
SLU-0	14-2; 8-3, 8-4	Slew. Indicates a temporary wait for the display controller while the deflection circuits are lagging the deflection inputs and establishing the new deflection position.
SRTS(A)-1	3-5; P102	Secondary Request To Send (RS-232A). SRTS(A) is the RS-232A secondary request to send output. SRTS is defined on a different connector pin for RS-232C, and so is strappable on the board.
SRTS(C)-1	3-5; P102	Secondary Request To Send (RS-232C). SRTS(C) is the RS-232C counterpart to SRTS(A) above.
STATEN-0	3-5; 3-1	Status Enable. STATEN is low during an MPU read of status at IO location X'00ED' or X'00EF'.

Signal	Source; Destination	Explanation
STEPX-0	9-1; 9-2, 9-3	Step X Axis. Clocks X Counter to set character spacing.
STEST-0	P101; 3-5	Self Test. STEST is a line on the system bus which the Processor can read via a 3-state driver. The line is low when the self-test button is pressed.
SVECT-0	8-2; 9-1, 9-3	Short Vector. Data is in short vector format (during vector data transfer).
SVECT-1	8-2; 8-4	Short Vector. Data is in short vector format (during vector data transfer).
T3W4-1	3-1; 3-3	(State) T3, Wait, 4. T3W4 is high when the MPU is in a T3, T4, or TW (WAIT) state. T3W4 enables on-board data transceivers.
T4I-0	3-1; 3-3	(State) T4, Idle. T4I is low during MPU T4 and TI (idle) states. It turns off data transceivers during T4 in on-board memory and IO READs.
TARGET	18-2; 19-1	Target. Voltage established at the inside face (screen) of the crt.

SIGNAL LIST

Signal	Source; Destination	Explanation	Signal	Source; Destination	Explanation
TARSIG-0	19-1; HCU	Target. Display information signal from the target sent to the HCU when a hard copy is being made. Goes low when the scan crosses a written area on the crt screen.	TIMERINT-0	3-5; 3-2	Timer Interrupt. TIMERINT indicates the presence of either a PIT timer1 interrupt, a UART TXEMT interrupt, a UART TXRDY interrupt, an RS-232 status change interrupt, or an PIT TIMER0 interrupt (via RSCD).
TCLK-1	P102; 3-5	Transmit Clock. TCLK is the RS-232 transmit clock output from the Processor board.	TIMR1-1	3-5; 3-1	Timer 1. This signal is output from the O1 pin of the PIT. O1 is the output of a 16-bit programmable down counter.
TDATA-1	3-5; P102	Transmitted Data. TDATA is the RS-232 signal on which serial data is transmitted from the Processor board.	TRU Z	17-1; 18-1, 14-2	True Z (axis). Represents the true Z-Axis (always active high). Turns on crt writing beam depending on the status of the intensity control logic section. Overrides Antiburn circuitry in the first few microseconds of operation, due to the time lag of the Antiburn circuitry, so as not to blank out any beginning information. (See also Z AXIS signal definition.)
TEST-0	J104; 3-1	Test. TEST is an input to the MPU Processor. It is available at Pin 50 on the test connector, but is not used on-board.	TXC-0	3-5; P102	Transmit Clock. TXC is the buffered output of the PIT timer1 to RS-232 connector. It is not presently used.
TEST-1	3-5; 3-1	Test. TEST is a signal that the processor can set to enable the Clock Generator to locally terminate an on-board or off-board READ or WRITE operation. The signal is used for testing purposes, and is similar in function to the BTD circuit.	UBCLK-1	3-1; 3-4, 3-5	Unbuffered Bus Clock. UBCLK is a 4.9152 MHz square wave clock provided to clock the UART and PIMPU.

Signal	Source; Destination	Explanation
ULBHEN-0	3-1; 3-2	Unlatched Byte High Enable. ULBHEN is an MPU output. See BHEN for a description of this signal.
VAVIL-1	9-1; 8-2, 9-4	Vector Available. Vector data is available to vector set-up logic but has not yet been completely processed.
VCLK-0,-1	9-1; 9-2, 9-5	Vector Clock. 12 MHz clock signal.
VCLKA-1	9-1; 9-5	Vector Clock A. 12 MHz clock signal.
VCOMP-1	9-2; 9-2	Vector Completed. Completion Counter has detected end of vector.
VIEW-0	8-1; 18-1	View. Resets the view erase counters. (GBUSY or Z-AXIS will also do this, depending on the placement of the view reset strap).
VSTRT-0	9-1; 8-4	Vector Start. Vector generation has started.
VSTRT-1	8-4; 8-2	Vector Start. Vector generation has started.
WAIT-0	HCU; 18-1	Wait. Remains low until the display screen has been scanned. (Applies only to a hard copy unit with multiplexer option.)

Signal	Source; Destination	Explanation
WELSB-0	5-1; 5-2 7-1; 7-2	Write Enable Least Significant Byte. WELSB is a control strobe to the RAM Array board indicating that a write operation to the least significant byte of RAM is in progress.
WEMSB-0	5-1; 5-2 7-1; 7-2	Write Enable Most Significant Byte. WEMSB is a control strobe to the RAM Array board indicating that a write operation to the most significant byte of RAM is in progress.
WRITE-THRU-0	8-4; 17-1	Write Thru. Selects WRITE-THRU INTENSITY CONTROL (R227-Coarse Write Thru) and disables NORMAL and BRITE INTENSITY controls.
WT INTENSITY	15-1; 17-1	Write-Thru Intensity. Controls the WRITE-THRU INTENSITY by R227 adjustment (see WRITE-THRU-0).
X+	9-5; 14-1	X (axis). X-axis input to monitor. (Written + X and -X on schematics.)
X0-11	9-4; 9-5	X DAC Input Data Bits. Scissored data to X DAC.

SIGNAL LIST

Signal	Source; Destination	Explanation
XACK-0	5-1; 5-2 7-1; 7-2	Transfer Acknowledge. The DRC generates XACK to acknowledge that a RAM read or write operation is in progress. This signal latches the RAM output data into the Data Output Latches.
XCLK-0	P129; 5-1 P166; 7-1	External Clock. When the Clock circuitry is disabled using CLKDIS , an external TTL clock signal may be fed into XCLK to control the DRC. (This is a test point for factory use only.)
XE-1	9-3; 9-5	X Enable. Enables X Decoder gates.
XS-0	9-3; 9-5	X Sign. Sets X vector directions.
XTRA-1	6-1; none	Extra. EXTRA is an extra line of the RAM Array board that is currently not used. It may be used in the future.
Y+	9-5; 14-1	Y (Axis). Y axis input to the monitor. (There are "+" and "—"Y axis signals on the schematics.)
Y0-11	9-4; 9-5	Y DAC Input Data. Scissored data for Y DAC.
YE-1	9-4; 9-5	Y Enable. Enables Y Decoder gates.

Signal	Source; Destination	Explanation
YS-1	9-4; 9-5	Y Sign. Sets y vector direction.
Z-AXIS	9-5; 18-1, 17-1	Z-axis. True signal turns on the crt writing beam depending upon the status of the intensity control logic section. Also can be strapped to accept either TTL state (high or low) input signal.
ZOUT-1	9-5; 9-1	Z Axis Output. Crt beam current control.
ZVECT-0	9-2; 9-1	Zero Length Vector. Indicates vector length is zero.

Appendix B

ASCII CODE AND KEYCODE CHARTS

This appendix includes a standard ASCII code chart and additional ASCII code charts which define the specific characters used as parameters (indicated by unshaded areas).

The code charts are:

Table Description

- B-1 ASCII Code Chart
- B-2 Characters Used in <Char> Parameters
- B-3 Characters Used in <Int> and <Int+> Parameters

Table Description

- B-4 Characters Used in <Int-Report> Parameters
- B-5 Characters Used in <Xy> Parameters
- B-6 Characters Used in <Xy-Report> Parameters
- B-7 United Kingdom Character Set
- B-8 Swedish Character Set
- B-9 APL Character Set
- B-10 Danish/Norwegian Character Set
- B-11 Keyboard Keycodes
