The IEEE show looks ahead toward the next decade and finds engineers will be deeply involved in improving the quality of urban life: computer-run city halls, a revolution in CATV, electronic medicine, traffic-control systems, cleaner air and water—these are just some of the possibilities. For a preview, turn to page U84.
The Performance Champ—world’s fastest general-purpose real-time scope!

The HP 183A Oscilloscope system adds one more way that you see more—do more with the field-proven 180 scope system.

Now you can measure from dc to 250 MHz—real time! Now you have a vhf scope that also gives you a bright dual-trace with a fast-writing speed of 4 cm/nsec on a big 6 x 10 cm screen. Plus, a sensitivity of 10 mV/div for low-level signal measurements—sweep speeds of up to 1 nsec/div for easier viewing of high frequency signals—and complete compatibility with the entire 180 series of plug-ins.

Sound expensive? Well, the 183A mainframe with a 250 MHz dual-channel vertical amplifier and a >250 MHz time base costs only $3150. That’s less than some systems that don’t even approach this kind of high frequency performance.

The basic 183A mainframe uses the all-new step-ahead technique of a CRT transmission line deflection system to provide real-time bandwidth beyond 500 MHz. And since it contains only the CRT and power supplies, future, improved plug-ins will give you full performance in the mainframe you buy now. You won’t have to worry about built-in mainframe limitations—now or in the future.

If you’re interested in maximum scope performance per dollar invested, then the HP 180 system is the answer. From 50 MHz, to 100 MHz, to sampling, to variable persistence and storage scopes, the 180 system has the right combination to meet your requirements. You get more for your dollar today. You get more for your dollar in the future. You get the best performing, most versatile high-frequency scope system available today!

For more information, call your local HP field engineer. Or, write to Hewlett-Packard, Palo Alto, California 94304. Europe: 1217 Meyrin-Geneva, Switzerland.
THE "INTERMEDIATE" SYNTHESIZER

160 MHz for $5900

Buying a frequency synthesizer has been something like buying a car. There's a confusion of models, options, and price ranges. Except — there has never been a so-called "intermediate"-model synthesizer. That's because price and performance ranges of synthesizers have tended to cluster just at both ends of the spectrum. The choice was between lower-cost, limited-frequency-range models and those with everything, including a sky-high price tag. So, the buying decision was one based on either trade-off or over-capability.

This is not true any longer! GR has filled the price-capability gap with the new 1165 Frequency Synthesizer. Frequency range is wide, 0.01 to 160 MHz in 100-Hz steps. The price is only $5900, less than half the price it used to cost to get 160 MHz. If you can furnish your own frequency reference signal (5 or 10 MHz), you can get a model for only $5300. In the $5900 model, frequency accuracy is maintained either by an internal precision 10-MHz oscillator (1 x 10^9 per day) or by an external drive or lock source. Output is 0.1 to 1 V into 50 ohms. Both frequency and level can be externally programmed; the 1165 is ideal for applications requiring remotely-programmed local oscillators. Harmonics are typically down 30 dB (at maximum output into 50-Ω load); spurious, discrete non-harmonic signals are typically down 60 dB.

For complete information, write General Radio, West Concord, Mass. 01781; telephone (617) 369-4400. In Europe: Postfach 124, CH 8034, Zurich, Switzerland.

GENERAL RADIO

See the 1165 in action at the IEEE show, along with a "showroom" full of other products from GR. Booths 2E26-2E36.
Why are we advertising this Fairchild DVM?

Because it's now a Systron-Donner DVM. Along with its companions, the famous Model 7000A has been combined with S-D DVM's to form one big broad line. In fact, we can now fulfill more DVM needs than anybody else. And with field-proven, state-of-the-art instruments to boot!

The new S-D line covers everything from $245 panel meters to 0.005% guarded multimeters to programmable systems meters. Every DVM uses dual slope integration, the best measurement technique yet developed.

What's more, only S-D offers you the true flexibility and economy of plug-in cards (not modules). For example, the Model 7000A expands from a basic DC voltmeter to a multimeter simply by slipping cards into already existing slots. You can add AC volts, ohms, current, 100 mv and many other options—at any time.

You get the most performance for the money, too. The proof is in our new catalog. For your copy, write Measurements Products Division, 888 Galindo Street, Concord, California 94520, or call (415) 682-6161.

Another first! One of 157 S-D instruments. News Scope CONTINUED

of carbon and a highly ionic conducting solid electrolyte. Its absence of electrical leakage has permitted a device that was energized in June, 1969, to still retain over 96% of its charge.

Oxley has not yet tried to get more than 50 farads, but he says it is possible, "if someone needs it."

A basic limitation on the device is that it can be used as a capacitor only at dc. As frequency is increased, the capacitance falls off drastically. By 2 Hz, it is down to 1/50 of its dc value, says Oxley.

(For details see p. 227).

Demand for engineers declined again in 1969

For the third consecutive year, the demand for the services of engineers and scientists has dropped, according to the Engineer/Scientist Demand Index maintained by Deutsch, Shea & Evans, a New York advertising agency. Reasons for the decline, according to DS&E relate to cuts in Government contracts with defense and aerospace industries.

The average demand level for 1969, according to the index, was 108.5. This is a 6.3 drop from the previous year's average of 114.8 and more than 80 points below the peak demand of 190.3 in 1966.

Monolithic readout challenges Nixies

The first solid-state numeric display to compete in the market place with gas discharge tubes has been announced by Monsanto Electronic Special Products, Cupertino, Calif.

The display is made of gallium arsenide phosphide deposited over a substrate and the diodes are interconnected to form seven-segment numerics. Called the MAN-3, the display requires an external decoder/driver.

For orders in the 20,000-unit range, Monsanto says the costs will be comparable to those of Nixie tubes.

Optical circuits carry laser light

Nickel-size optical circuits for laser light can be made of lightguides—hairlike, transparent pipes—it was recently announced by Bell Telephone Laboratories, Murray Hill, N.J.

The lightguides, 100 times thinner than a human hair, are deposited (sputtered) as a film on a glass plate. According to Bell Labs, lightguides can be interconnected to form complex optical circuits that perform functions similar to those of electronic circuits in computers and communications equipment.

Such a circuit would be relatively unaffected by heat, noise, or vibrations, says the company. Lightguides can carry laser beams around relatively sharp bends.

Closed-circuit TV sales boom in big-time racing

Horse racing is paying out big money for closed-circuit TV—both black-and-white and color systems. Market potential for racetrack systems throughout the country approaches $25 million, according to Al Ajar, president of Video Projects, New Hyde Park, N.Y.

Over 850,000 has recently been awarded to Video for black-and-white installations at Liberty Bell Park, Philadelphia, and for color TV systems for Aqueduct and Belmont tracks in New York City and the Saratoga racetrack in upstate New York.

The closed-circuit systems not only keep the racing fans posted on betting odds, race results, and photo finishes, but provide video playbacks for stewards and judges. Only about 10% of the racetracks in this country have similar systems at present. Most others use cinematography for playbacks.

New gas engines offer computer standby power

Because the data-processing industry is one of the fastest growing markets for standby power systems, the Yardney Electric Corp., known for its Silvercel batteries, has recently announced a new line of gasoline-engine-powered generators designed to insure power for computers.

Sheldon Keilson, manager of the electronics systems department, pointed out that, as semiconductor memories become more generally employed, the problem of safeguarding information stored in such volatile memories becomes more acute.

Since the company plans to reduce its stake in R&D and increase its emphasis on production, it is transferring its New York City operations to its Pawcatuck plant, Stonington, Conn.

Space-shuttle studies to begin next month

Proposals for a contract for preliminary design of the National Aeronautics and Space Administration's space shuttle are due on March 30. Eight companies were invited to submit proposals, and three will probably win. The parallel studies will last 11 months; then the final contractor will be picked.

The two-stage shuttle carrying 10 passengers will take off in a vertical position. Both stages will be manned and both will return to earth and land horizontally.

The eight competitors are Lockheed, Burbank, Calif.; Chrysler, Detroit; Grumman, Bethpage, N.Y.; General Dynamics, San Diego; North American Rockwell, Downey, Calif.; Martin Marietta, Denver; and McDonnell-Douglas, St. Louis. Monitoring the work will be NASA's Marshall Space Flight Center, Huntsville, Ala., and the Manned Spacecraft Center in Houston.

Ultrasound used to check for heart disease

Rather than passing a catheter (a long thin pipe) into one of the heart chambers to screen patients for suspected heart disease and monitor heart activity, scientists have used ultrasound, a form of sonar.

The ultrasound studies were performed by Stanford University and NASA's Ames Research Center.

INFORMATION RETRIEVAL NUMBER 18
News Scope

U.S. electronics may be hit by European trade agreement

American electronic manufacturers could be disqualified from selling their wares in the European market by regional trade agreements among the Common Market countries and the European Free Trade Association.

According to a spokesman for the Electronic Industries Association (EIA), a tripartite agreement among Britain, France and Germany is on the verge of being signed. This would exclude the sale of electronic components and equipment by nonmember countries. Such U.S. sales total over $1 billion, according to Leon Podolsky, technical advisor to the U.S. on electronic components for the International Electrotechnical Commission.

The IEC is the worldwide organization for the development of international electrical and electronics standards. Its membership comprises 41 countries, including the Communist bloc nations.

The EIA spokesman said, "We have been told by representatives of the tripartite countries that they intend to invite others to participate, but not for a year or so. But by that time, their procedures and standards may be set in concrete."

The EIA is proposing a self-certification system to be administered by the IEC or some other completely international group. This proposal would be implemented similarly to the qualified product list that is now used in certifying military products.

The nations participating in the tripartite agreement have proposed reliability and quality control certification program through the European Committee for the Standardization of Electronic Components (CENEL). The administration and testing of components would be done by the European Committee for Quality Assurance, presumably consisting of representatives of the member countries.

At a press conference last month, sponsored by the American National Standards Institute, Inc., Richard O. Simpson, Deputy Assistant Secretary of Commerce, warned that if American representatives don't participate in the formulation of standards by the IEC, U.S. products may not be compatible for both domestic and European markets. The alternative for a manufacturer might be to produce specials for overseas requirements, reducing savings and profits inherent in mass production.

The implications of what happens at the upcoming IEC meeting in Washington, D.C., in May could have a decided bearing not only on electronics sold in Europe, but also on the entire spectrum of household electrical appliances—from blankets and heating pads to washing machines, Simpson said.

Simpson urged support of the American National Standards Institute, which is coordinating this country's participation in IEC work. "Our entire economy is affected," he said. "The job of the average industrial worker may depend on how successful U.S. industry is in selling American products at home and increasing exports to other countries."

Return-beam vidicon proves versatile

A new return-beam vidicon tube, developed by RCA, Lancaster, Pa., will be applied as an ultra-high-resolution device in two different applications. The first is a camera in the NASA Earth Resources Technical Satellite, slated to be launched in the first quarter of 1972; the second is an electron-image scan converter in an Air Force data-conversion system.

The earth satellite camera under development by RCA Astrotechnics Div., Hightstown, N.J., uses a return-beam vidicon with a two-inch-square photosensitive surface. This camera will photograph a 100 x 100-foot swatch of the earth from a proposed orbiting altitude of 5000 miles.

Sponsored by the NASA Goddard Space Flight Center, Wallops Island, Va., the proposed satellite will provide complete inventory of the entire world every day: Using infrared and multispectral cameras, the satellite could detect blighted areas, check for pollution on land and in the oceans and even relay back the movements of large schools of fish.

In the Air Force data-conversion system under development at the RCA Aerospace Systems Div., Burlington, Mass., and sponsored by the Avionics Laboratory at Wright Patterson Air Force Base, Dayton, Ohio, a return-beam vidicon with a 4.5 inch photosensitive surface is used as a high-resolution scan converter utilizing electrical read-in and read-out. This particular tube, according to John R. McAllister, RCA Div. vice president, has achieved 10,000 TV lines of resolution in the laboratory. This can be compared to 450 effective lines on a good TV set.

Half-dollar-sized disc holds up to 50 farads

Energy-storage devices with 10,000 times more capacity than the best tantalum capacitors have been developed by Gould Ionics, Inc., Canoga Park, Calif. According to James Oxley, technical manager of the company, the "electrochemical device not only has very high-capacity density, but also has orders-of-magnitude better charge retention than an electrolytic capacitor."

The device consists of two electrode wafers separated by an electrolyte wafer. According to Oxley, high capacitance (up to 300 farads/in.²) is "a result of maximization of the electrode/electrolyte interface area in structures consisting of a finely divided blend..."
Why NIXIE® tubes when we just developed SELF-SCAN™ panel displays?

NIXIE tubes are your only logical choice for digital readouts containing up to 8 digits. Their long life, uniform brightness (200 ft. lamberts with no chance of partial fadeout) and the wide choice of configurations available help make NIXIE tubes the most economical, reliable, and readable digital readouts on the market for most panel displays.

But when your display requires 8 to 10 or more digits, turn to Burroughs' amazing new SELF-SCAN panel displays.

Designed for larger displays, SELF-SCAN panel displays reduce drive circuitry up to 90%, thereby eliminating a major cost of readout systems. And you can specify SELF-SCAN panel display systems with or without memory. Flicker-free, comfortably readable in the brightest light or darkest shadows, SELF-SCAN panel displays provide unparalleled savings for readouts with 8 to 400 digits of alphanumeric display.

Regardless of your readout requirements, one of Burroughs' team of digital displays — industry standard NIXIE tubes or the outstanding state-of-the-art advance, SELF-SCAN panel display systems — will meet your needs.

For additional information write to Burroughs Corporation, Electronic Components Division, P.O. Box 1226, Plainfield, N.J. 07061. Tel: (201) 757-3400.

It's a matter of DOLLARS AND DIGITS

More than 8 digits? Choose the new Burroughs SELF-SCAN panel display.

For 8 digits or less, NIXIE tubes are still your most profitable answer for readout displays.

See us at IEEE Booth #2D39-45
Electromechanical sensors, such as linear transformers, resolvers and synchros, are commonly used in control systems because they provide precision and economy. With the application of digital computers in control systems, simple and accurate methods for converting the ac outputs of these sensors into digital form become vital.

This design guide describes improved techniques leading to efficient, lower-cost synchro-to-digital converters.

Page 178

Called an energy-storage device (ESD), a new electrochemical capacitive component bridges the gap between a conventional capacitor and a secondary battery. About the size of a half-dollar, the 0.5-V ESD attains capacitances of about 50 farads with an approximate internal resistance of 1 to 2 ohms.

The new device is made of pressed powder wafers and is currently intended for straight dc applications.

Page 227

Electronics in the changing world of the seventies is the theme at this year's IEEE International Convention and Exhibition. More than at any previous show, the emphasis is on the peaceful uses of electronics—computer techniques in urban government, community antenna television, air and ground traffic control, medical aids for the handicapped and air and water pollution control.

...want a tantalum capacitor with proven performance?

Buy TYPE 150D TANTALEX® SOLID-ELECTROLYTE CAPACITORS

- Hermetically-sealed in metal cases
- Four case sizes, ranging from ¼" to ¾" length
- Value-packed performance characteristics—low impedances at high frequencies, low dissipation factor, minimal capacitance drift with temperature, practically no change in capacitance with life
- Low leakage current limits
- New higher capacitance ratings
- Request Engineering Bulletin 3520F

...need a reliable wirewound resistor?

Specify ACRASIL® PRECISION/POWER RESISTORS

- Excellent stability and reliability, even under extended load life, extremely high humidity, and other adverse operating conditions
- Expansion coefficient of silicone coating is closely matched to that of ceramic base to insure against damage to resistance winding
- Coating provides exceptional protection against moisture, shock, vibration, fungus
- Available with standard and non-inductive windings
- Resistance tolerances as close as ±0.05%
- Request Engineering Bulletins 7450A and 7450.1

For Engineering Bulletins as noted above, write to:
HERE'S HOW THE
V-O-M SPECIALISTS
GO DIGITAL

The principal problem with digital V-O-M's is that circuitry (rather than readability) limits their accuracy. Triplet has attacked that problem with characteristic thoroughness. The result...a totally new circuit (patent pending) in which there is virtually no internally-generated current from the V-O-M input circuit to affect measuring accuracy. Triplet's Model 8000 digital V-O-M...the only V-O-M with this newly-developed circuit...offers a true DC accuracy of 0.1% of the reading ± 1 digit and an AC accuracy of 0.2% ± 1 digit. Triplet calls this "true accuracy" because it's the same accuracy you can achieve day-in and day-out, test-after-test, on any kind of circuit.

Quality-minded buyers will appreciate, too, the other job-matching features of Triplet's new digital V-O-M. Like...AC and DC voltage measurements from 1 mV to 1000 V in 5 ranges at 10 megohms input resistance; AC and DC currents from 0.1 uA to 1000 mA in 6 ranges; 0.1 ohm to 100 megohms in 6 ranges.

Sounds like it was worth waiting for, doesn't it? It's ready for immediate delivery from your Triplet distributor at $575 suggested USA user net. If you'd like the added convenience of an instant replay circuit that displays a previously-stored reading for on-demand comparison with an existing reading, ask for the Triplet Model 8000-A at $630 suggested USA user net. For more information, or for a free, no-obligation demonstration, call your local Triplet distributor or sales representative. Triplet Corporation, Bluffton, Ohio 45817.

TRIPLETT

The World's most complete line of V-O-M's...choose the one that's just right for you

1. True 0.1% DC accuracy. Virtually no kickback current*. Allows voltage measurements in high resistance circuits at stated accuracy.
2. High AC accuracy with nearly perfect AC linearity and 10 megohm input resistance.
3. Low profile design in shielded case with modular construction for ease in use and maintenance.

*There is virtually no internally generated current from the V-O-M input circuit to affect measuring accuracy. (Patent pending on this feature).
FIGURE 3b. 2A Negative Regulator

sistors increases the output current without increasing the minimum input-output voltage differential. The minimum differential will be 2 to 3V, depending on the drive current required from the integrated circuit and operating temperature. Low input-output voltage differential allows more efficient regulation.

Although the regulators are relatively simple, some precautions must be taken to eliminate possible problems. First, when the regulator is used with boost transistors, a solid tantalum output capacitor is needed. Unlike electrolytics, solid tantalum capacitors have low internal impedance at high frequencies. This suppresses possible high frequency minor loop oscillations as well as providing low output impedance at high frequency. Also, for the LM104, the output capacitor frequency compensates the regulator and must have good frequency characteristics.

The power transistors recommended are single-diffused, wide-base devices. These devices have fewer oscillation problems than double-diffused, planar transistors. Also, they seem less prone to failure under overload conditions. Of course, like the power transistors in any regulator, adequate heat sinking is necessary. The heat sink should keep the transistor junction temperature at an acceptable level for worst case conditions of maximum input voltage, maximum ambient temperature and shorted output. By far, the major cause of regulator failures is inadequate heat sinking.

Good construction techniques are also important for regulator performance. If proper care is not taken, ground loop errors and lead resistance drops can easily become greater than regulator errors. For example, 0.06" wide, 2 oz. printed circuit conductor has a resistance of about 0.007Ω per inch. For a 200 mA, 15V regulator, ten inches of conductor would decrease the regulation by a factor of 2.

Ground loops are worst yet, since voltage drops can be amplified and appear at the regulator's output. In Figure 3, voltage drops between Pin 4 of the LM105 and the bottom of R3 are amplified by the ratio of R2/R3 and appear at the output.

When the regulator is powered from ac that is rectified and filtered, current flowing in the filter can sometimes cause an unusual ground loop problem. For capacitor input filters, the peak charging current is many times the average load current. Even a few milliamps of resistance can cause appreciable voltage drop during the peak of the charging. When the charging current produces a voltage drop between R3 and Pin 4 of the LM105, it appears as excessive ripple on the output of the regulator.

Of course, single point grounding eliminates these problems, but this is not always possible. Usually it is sufficient to insure that load current does not generate a voltage drop between the ground side of the voltage setting resistor and the ground of the IC.

In most cases, short circuit protection is the only fault protection needed. However, for some regulator circuits, such as positive and negative regulators used together, additional protection is necessary. If the positive and negative supplies are shorted together, it is possible to cause the output voltage of one of the supplies to reverse, blowing the IC. This is especially true if the current capabilities are different, such as a 200 mA negative supply and a 2A positive supply. A clamp diode between the output and ground of each supply will prevent such polarity reversals. Also, clamp diodes should be used to prevent input polarity reversal and input-output voltage differential reversal.

The use of ICs in regulator circuits can enhance power supply performance while minimizing cost and engineering time. Since only one IC is needed for a wide range of outputs, the part cost, board space and purchasing problems are less when compared to discrete designs. Also engineering time is saved since typical and worst case performance data, as well as application data, is available from the manufacturer before design is begun.

IC REGULATORS SIMPLIFY
POWER SUPPLY DESIGN

Although power supply requirements vary, IC voltage regulators can fulfill the majority of needs. Power supplies designed with ICs can give predictable regulation better than 0.1% with a minimum of engineering effort. Output voltages between 0 and 40V at currents of 10A are easily achieved. Further, with a minimum of changes, a single regulator circuit can be used for a wide variety of output voltages and currents.

A basic 200 mA positive regulator circuit is shown in Figure 1. The LM105\(^1\) contains the voltage reference and control circuitry while the external components set the output voltage, current limit and increase power handling capacity of the IC. The output voltage is set by R\(_2\) and R\(_3\). A fraction of the output voltage is compared by an error amplifier with an internal 1.8V reference. Any error is amplified and used to drive the 2N3740 power transistor. Since the open loop gain is large, there is little error and a high degree of regulation.

Current limiting is set by R\(_1\). The voltage drop across R\(_1\) is applied to the emitter base junction of a transistor in the IC. When the transistor is turned on, it removes drive from the series pass transistor; and the regulator output exhibits a constant current characteristic. Since the turn on voltage of a transistor is temperature dependent, so is the current limit. The current limit sense voltage is about 0.4V at 25°C decreasing linearly to 0.3V at 125°C. Therefore, the current limit resistor must be chosen to provide adequate output current at the maximum operating temperature.

To regulate negative voltages, the circuit in Figure 2 is used. An LM104\(^2\) contains the voltage reference and control circuitry while an external transistor is used to increase the power handling capacity. A reference voltage is generated by driving a constant current, determined by R\(_1\), through R\(_2\). The voltage across this resistor is fed into an error amplifier. The error amplifier controls the output voltage at twice the voltage across R\(_2\). The output voltage is resistor programmable with R\(_2\) and adjustable down to zero.

Current limit in the LM104 is similar to the LM105. Voltage across R\(_3\) turns on an internal transistor that decreases drive to the output transistors. This current limit sense voltage is also temperature dependent, decreasing from 0.65V at 25°C to 0.45V at 125°C.

Boosting the available output current from 200 mA is relatively simple. Figure 3 shows positive and negative 2A regulators. An additional power transistor increases the current handling capability of the regulator. Adding the boost tran-
Our 5000 and 7500 permeability Ceramag® ferrite materials can pack a terrific amount of inductance into a small size.

And the higher the perm, the fewer turns required. Results. Lower distributed capacity. Material savings. Improved performance. Ceramag® offers the designer a true 5000 permeability. New, Ceramag® 24K is also a true 7500 permeability. Both materials hold their permeability over a wide range of sizes.

Ceramag® 24H and 24K are production materials, ready for immediate use in your design. Stock available in some sizes.

Precisely engineered, Stackpole ferrite materials are produced by exact processing, density checks, rigid kiln controls and accurate sintering. You get more out of Stackpole Ceramag® materials simply because we put more into them.

Study the characteristics of 24H and 24K, then consider how you might use these ferrites.

For more information, samples and applications, contact:

Disaccommodation factor for both materials is $1.4 \times 10^{-6}$, typical.

Producing high quality Ceramag® ferrite components for the home entertainment, industrial electronics and computer industries for over twenty-two years.

**Cut to your specifications.

7-DAY SUBSTRATES

Coors ships the following substrates within 7 calendar days of receipt of order:

- Standard-Size Blanks - 15, 20, 25, or 30 mils thick; same quantities and wide choice of sizes as 4-day substrates.
- Custom-Cut Blanks - 15, 20, 25, or 30 mils thick; same quantities as 4-day substrates.
- Parts With Holes - maximum 250 pieces per order; maximum 50 holes per piece; minimum 15-mil hole diameters; 10, 25, or 35 mils thick.
- State-Breaks® - maximum 500 pieces per order; maximum 100 segments per piece; 1 to 4 sq. in. total part size; 10 or 25 mils thick. (Sizes listed in DS-1402.)

Why wait 8 to 16 weeks (or more) for ceramic substrates?

Coors ships the parts shown at the left in 4 calendar days (or less).

And the cost is lower than you might think.

For details on part sizes, shapes, tolerances, and materials, send for data sheet 1402.

Announcing a first-class second source for Series 9300 MSI.

Now for the first time you can get 9300 TTL MSI circuits... today's high-versatility logic with optimum speed-power product... and made by Philco-Ford, the people long identified with high reliability in IC production.

We're bringing you the most wanted MSI types first: registers, counters, decoders, and multiplexers. Versatility is built in; additional logic requirements are pared way down... in some cases eliminated. Then there's the packaging. Don't forget it's ceramic DIP with proved hermeticity... by the people who know Cerdip.

Here are the first six, with more coming soon:

- PL9300 4-bit universal register
- PL9306 BCD up/down counter
- PL9311 1-of-16 digital decoder
- PL9312 8-bit digital multiplexer
- PL9316 binary hexadecimal counter
- PL9328 dual 8-bit shift register

Need analog MSI? Call a Philco Hybrid Hunter.

Want to microminiaturize a circuit now designed for discrete components? Need more voltage, current, or power capability than you can get from monolithic integrated circuits?

Then you need an AMSI by Philco. Here's an example of an AMSI hybrid circuit now in volume production at our Spring City hybrid facility. It's a triple detector circuit, contained in a 1 x 1-inch all-hermetic flatpack made by Philco-Ford. Look what's inside:

- 13 thick-film resistors, in values from 3.9K to 182K ohms. All resistors are 1% tolerance, low TCR.
- 6 capacitors, in values from .033 to .33 µfd. All capacitors 1% tracking with temperature.
- 19 active PNP and NPN devices, with Vbe and Vce matching ±5 millivolts.

When you need AMSI, call a Philco Hybrid Hunter. Just show us your circuits... and give us a month. We'll have prototype hybrid circuits on your desk. They will be ready for production in one of the most experienced hybrid facilities in the country. And they will be priced competitively.
**1024-bit static ROM**

The Philco® MOS 1024-bit read-only memory has a static output data level. It remains valid as long as an address is present. That means you can address it as slowly as necessary to be compatible with your output device, and the extra expense of clock generators and drivers is eliminated.

Bit pattern, 128 8-bit words; access time, typically 2 µs; cost in 100-piece lots, less than 4 cents per bit.

The pMS1024C static ROM is packaged in a 24-lead hermetic DIP. Samples available now in character generator form.

And for high-speed applications, try our dynamic ROM... comparable costs and access times less than 1.0 µs.

---

**COMING SOON FROM PHILCO-FORD**

- New MOS memory products
  - 256-bit RAM
  - 2048-bit static ROM
  - 2240-bit static character generator ROM
- PL7751 Differential wide-band memory sense amplifier
- Schottky-barrier diodes in new packages

---

**Our InSb multi-element IR detectors are all ours.**

Because Philco® detectors are made entirely in-house. The whole assembly... detector array, liquid nitrogen- or cryostat-cooled dewar with cooled filter, and matching current-mode preamp.

What does this mean to you? Your interface problems are eliminated. You also gain from the start-to-finish quality control. By growing our own InSb, for example, we control impurity levels for maximum sensitivity and low noise performance.

And we've been doing these things for over 10 years... long enough to have more InSb photovoltaic detectors in the field than anyone else.

Take a look at some of the specs... elements as small as .05 mm x .05 mm with element spacing .025 mm for high resolution, detectivity approaching theoretical limits, linear arrays of more than 100 elements, and detector impedance of 10 megohms or more.

---

**UHF to Ku band. How's that for broadband switching?**

That's what you get with our new Philco® P9800 Series coax switch assemblies.

And switching performance over any part of that range is better than just about any narrow-band switch assembly you can find.

The secret? The P9800 Series employs our new L8370/L8380 Series integrated switch modules. These hermetically sealed modules eliminate the package parasitics which limit the broadband performance of conventional semiconductor diode switches.

These new modules, which are also available separately, permit switching ratios in the order of 50 db over the specified operating frequency range with switching speeds down to 10 nanoseconds.

You can get the new P9800 Series switch assemblies with integral hybrid drivers to solve your control circuit interface problems. In addition, units designed to exhibit linear attenuation or other special characteristics can be supplied as required.
Heads: You win.

Tails: You win again.

Elco rack-and-panel connectors give you a better head start.

And a choice of tails.

The head start is the connecting end of an Elco connector: the patented Varicon™ contact that fully meets the requirements of MIL-E-5400. The four mating surfaces of this unique contact are coined to an exceptional hardness and wipe clean with each make. Once the contacts are joined, the inherent springiness of the gold/nickel-plated phosphor bronze and the fork-like design make a superior, gas-tight fit.

Because the contacts are free floating, they align perfectly. A few contacts or 100 or more, all fit precisely together every time, over a long service life. There's no contact chatter.

Nobody else gives you a contact head quite like the Varicon.

And nobody else gives you the choice of tails you get with Varicon. You can wire-wrap, crimp, clip, stake, or solder them. Whatever terminating technique or combination of techniques your assembly lines are set up for, we'll furnish the appropriate tail. If staking or crimping is your style, we can supply the equipment too. Manual or automatic. Purchase or lease.

Elco rack-and-panel connectors come in standard rectangular models, or as miniature connectors, or in modular units. You can have them with 2 Varicon contacts, or up to 140, or anything in between.

In short, our line of Varicon rack-and-panel connectors has a lot going for it. Except price. Though it's a precision component, the Varicon contact is easily produced in high speed progressive dies. There's no expensive machining, no waste. When you can turn out millions of Varicons a week, you don't have to charge a fortune for them.

There's a lot more to be told about Varicon connectors. It's all in our 28-page rack-and-panel connector guide, and we'll be happy to send you a copy. Just write, wire, call, or TWX us. Elco Corporation, Willow Grove, Pa. 19090. (215) 659-7000. TWX 510-665-5573.

See us at NEPCON Central Booth 215
The Following Performance Is Brought To You By The Only Manufacturer Of 50 A, Hot Carrier Rectifiers

- 0.65 V maximum forward voltage drop @ 100 A
- Constant rectification efficiency to 500 KHz and beyond
- 800 A surge capacity

50% less power loss than conventional alloy or diffused devices!

That's the advantage in efficiency behind the new MBD5500, 50 A (Io) hot carrier silicon rectifier. And, not only does this unique high-current device cut your power losses through unmatched low forward voltage drop but it trims time and money outlay for required heat sinking through one of the most efficient, low-cost package designs available – the pressfit (DO-21 outline).

Employing Schottky barrier, low resistivity, metal-over-oxide junction techniques in a large area chip, the 20 V (VRM(rep)) MBD5500 is perfect for use in low voltage power supplies in computers and other applications where power loss and/or high frequency rectification are prime design considerations.

Its "majority carrier" operation makes it inherently suitable for applications where extremely low stored charge is required or where commutation transients are a problem.

Combine these advantages with top rectification efficiency, excellent surge-handling, low thermal resistance and passivated junctions and you've virtually got the "ideal" diode . . . the MBD5500 – available now for evaluation from your franchised Motorola distributor.

Turn one loose in your circuit design and watch it go – efficiently! Write Box 20912, Phoenix 85036 for more data.

-where the priceless ingredient is care!
**solve temperature control problems**

**OFFER PRECISE TEMPERATURE CONTROL, RAPID RESPONSE, MINIMAL DIFFERENTIAL ... from G-V**

G-V offers a wide selection of electrical thermostats for over and under temperature indication, alarm or cut-off service. They are designed to meet the rugged and precise requirements of both military and commercial applications including missiles, data processing equipment, etc. Both surface sensing and immersion types are available. For surface temperature sensing, crystal can size VE Series features a tolerance of ±3°C, a differential of ±1.5°C. Various models cover settings between -55°C and +150°C. The C8 Series cartridge immersion or air sensing thermostats are available with a variety of mounting brackets and terminals. They are supplied with a setting tolerance of ±5°F (±3°C), and repetitive operation within ±1°F can be expected. These units will withstand indefinite exposures to temperatures of -65°F to +300°F without damage. The C8 Series can be adjusted without damage to the hermetic seal. Contact ratings: VE Series, up to 3 amps; C8 Series up to 5 amps.

**INFORMATION RETRIEVAL NUMBER 811**

**AIR FLOW SENSING SWITCH**

A new design concept and technique is utilized to monitor presence of air flow. When air flow drops below a safe level, it operates an alarm or automatic shut-off. Used in electronic equipment, cooling packages, air conditioners, computers, etc. Features: Operates in any plane, no moving parts. No special adjustments.

**ONLY FROM**

**ELECTRICAL THERMOSTATS FOR INDUSTRIAL USE**

The D8 Series is suitable for a wide range of temperature control applications, offering exceptional stability. Since the encasing shell is the temperature sensing element, response to temperature change is very rapid. Features: contact ratings up to 5 amps, operating range -65°F to +300°F.

**DIRECT-LINE FIELD ENGINEERING SERVICE**

G-V assistance is always available to help you design and produce a better product. G-V Regional Field Engineers in your area will assist you and your design group in new applications and proper selection of your controls. G-V Product Engineers will help you with special applications. When you require experience, products and services in electro-mechanical and solid-state controls ... call your man from G-V.
Quick Connect thermal relays are designed to withstand the most demanding industrial applications. They reduce installation time and cost. Require only two mounting screws. Eliminates need for brackets, sockets, retainers. Features: time delays, 2 to 180 sec.; contacts, SPST, NO/NC; heater voltages, 6.3, 26, 115V AC or DC; resistive rating, 2A 115V AC or 1A 28V DC; mounts in any position.

*Recognized Under The Components Program Of Underwriter's Laboratories, Inc.
This is any digital logic system you can think of.

Gentlemen: I have a design for a digital logic system and I understand you have everything I need to put it together. Please send me complete information on the compatible system elements I checked below:

☐ J Series logic modules. A high quality line at moderate prices, using commercially available DTL and TTL circuits with noise-immune packaging.

☐ T Series logic modules. Proprietary IC's designed into noise-immune circuits. Highest fan-in and fan-out available.

☐ Automated wiring services. Computer generated listing; error-free verified wire-wrapping. Complete documentation provided.

☐ Mini-computer. A 16-bit processor with powerful instructions that conserve memory and an I/O structure with four different operating modes.

☐ Analog instruments. Low-level and high-level multiplexers, digitizers, D-to-A converters. 10, 12, or 15-bit resolution, choice of high or medium speeds, free-standing or coupled to the mini-computer.

☐ All of above.

A quick guide to magnetic drives: torque transmitters that work when other methods won't.

Magnetic drives offer you some relatively inexpensive solutions to difficult torque transmission problems. For instance, a magnetic drive can transmit torque through a non-magnetic barrier without using any mechanical connection. And because the system completely eliminates seals, it eliminates problems of leakage, maintenance and contamination.

3 basic types of magnetic drives.

1) **Synchronous drives** are equivalent to a shaft connection. Two basic arrangements are axial and radial. Axial drives consist of two Indox magnets or two Alnico side pole rotor magnets. Axial thrust is a maximum at zero load and diminishes as more torque is applied.

Radial drives consist of two ring magnets and have no axial thrust. Because of starting inertia, the outer magnet normally drives the inner one. When the maximum torque of a synchronous drive is exceeded, the driven member stops. This can offer important protection in event of overloading. And you never have to replace shear pins or worn frictional surfaces.

2) **Eddy current drives** use the field of a rotating permanent magnet to induce eddy currents in a conducting material. Interaction between these currents and the magnetic field gives rise to the torque of the coupling. Torque varies with the relative speed of the members. Eddy current drives use driven members of aluminum or copper in the form of cups, tubes or discs depending upon the configuration needed.

Radial drives consist of two ring magnets and have no axial thrust. Because of starting inertia, the outer magnet normally drives the inner one. When the maximum torque of a synchronous drive is exceeded, the driven member stops. This can offer important protection in event of overloading. And you never have to replace shear pins or worn frictional surfaces.

3) **Hysteresis drives** use the magnetic field of a rotating permanent magnet to drive the material of the hysteresis member through its hysteresis loop. The unit is synchronous provided the maximum torque isn't exceeded. Beyond this point the torque is independent of the slip speed and remains constant.

Hysteresis drives operate at close gaps. But unlike eddy current drives, hysteresis drives transmit constant torque.

Design aids available free.

The basic factors to consider in magnetic drive design include:
- radial or axial gap configuration
- relationship of torque to slip speed
- ambient operating temperature
- non-magnetic material through which torque must be transmitted
- maximum torque to be transmitted
- critical nature of the alignment.

We're anxious to help answer your questions. And we would like to send you some useful aids that include graphic presentations of important factors in magnetic drive design. Just write Indiana General, Magnet Products, Valparaiso, Ind. 46383.
Advanced Micro Devices has perfected the production technology of complex, mainstream digital and linear monolithic circuits.

James N. Giles collaborated with R. Widlar on the design and frequency-compensation of the first monolithic op amps. He wrote the Fairchild Linear Circuit Handbook, the industry's standard reference. He's Director of Engineering, Analog Operations.

Edwin J. Turney has ten years' sales management experience in the semiconductor industry. He's been involved in the growth and service needs of customers like XDS, Burroughs, NCR and many more. That's given him special credentials for his job as Director of Sales and Administration.

R. Lawrence Stenger increased the reproducibility of the UA 709 from 6,000 circuits per month to 400,000! His department produced 22 second-generation LICs in two years. He's Managing Director, Analog Operations.

Frank T. Botte worked on the industry's first linear I.C.s. He developed the first production-reliable MOS monolithic capacitor, making possible the UA741—the industry's first frequency-compensated op amp. Now he's Director of Development, Analog Operations.
W. Jerry Sanders III took eight years getting from sales engineer to chief marketing executive of a $100 million semiconductor company. Along the way he managed to learn the business from the men who invented it. He's Advanced Micro Devices' President and Chairman of the Board.

Jack F. Gifford led the linear circuit business into the industrial, computer peripheral and instrumentation markets. He's specialized in product definition and planning. That's why he's Director of Marketing and Business Development.

Sven E. Simonsen has more than four years in the development of monolithic complex digital circuits. He designed and developed the 9300 MSI sequential circuit family. He is Director of Engineering, Complex Digital Operations.

D. John Carey was responsible for the development and manufacture of 26 monolithic complex digital circuits in 12 months, including the 9300 MSI family. He's Managing Director of Complex Digital Operations.

Cover: Illustration of the electronic decade to come by Chris Randall
Get sine, square and triangle functions—and positive and negative going pulses, positive and negative going ramps—in the new HP 3310A. And there's more! You'll have these seven functions over a decade of decades—0.0005 Hz to 5 MHz.

All this capability is packed into a package only 7¾" wide, 4½" high, 8" deep! With the 3310A Function Generator performing many of the functions of the pulse generator, ramp generator, bias box and amplifier on your bench—you think about the clutter you eliminate...and the instant access you'll have to all these signals.

With the do offset capability of the 3310A, you can put any of the functions where you want them—easily and without biasing. And, with the choice of high or low level output, you can get clean low level signals without an external attenuator. You get a maximum of 15 V peak-to-peak into 50 Ω—and that's plenty of power to eliminate most needs for external amplification.

Add to this the external frequency control capability which allows you to sweep over a 50 to 1 range or tie the 3310A into a system—the price of only $575—solid-state reliability—and you know the HP 3310A is more than a function generator!

Order your HP 3310A today from your nearest HP Sales Office. For full specifications, write to Hewlett-Packard, Palo Alto, California 94304. Europe: 1217 Meyrin-Geneva, Switzerland.
The impact of LSI in the years 1970 to 1990 will be comparable to that of the transistor since 1950. This was the view of many designers at the 1970 IEEE International Solid-State Circuits Conference, held in Philadelphia last month.

The participants in a session on data communications considered the question, "What must happen when data terminals become something like the telephone?" Many papers described circuits and devices that were smaller, yet more complex than pre-LSI types; that were of larger capacity, yet easier to fabricate and potentially cheaper to manufacture. A megabit bipolar LSI memory system outlined by F. S. Greene Jr. and N. U. Phan of Fairchild Semiconductor, Palo Alto, Calif., epitomizes the trend of the future.

Each memory component is a bipolar chip measuring 0.111 inch by 0.159 inch. A coincident X and Y six-variable input (3 out of 6 code) is used for addressing information. A bi-directional data line controlled by a read/write input pin operates at 70-ns read access and 40-ns write. The memory is compatible with DTµL, TTµL, and CTµL and uses a 500-mW power supply.

New variable delay line

A completely new approach to electronic variable delay lines was presented by F. L. J. Sangster of Philips Research Laboratories, Eindhoven, the Netherlands. Although the basic concept of a "bucket brigade" storage capacitor has been described before, this marked the first time the device had been fabricated as an integrated circuit.

Information is stored in an array of capacitors as an amount below a nominal charge level. This permits the use of a simple circuit with only one transistor per storage capacitor.

The megabit memory and the bucket-brigade delay line typify the advances in data-communications hardware that can be expected this year. But an informal panel discussion moderated by Virgil I. Johannes, head T-5 digital line dept., Bell Laboratories, pointed to a proliferation of computers and remote computer terminals that will use such devices and combine them with chips containing 20,000 to 100,000 active elements.

Marvin Silverstein, principal engineer, Honeywell, Inc., St. Petersburg, Fla., said this would give more computer capability at a reduction in cost. But while hardware costs go down, cost increases can be expected in software, memory and displays, he said.

Much of the discussion focused on how "smart" the remote terminal should be to part of a telephone-like communication system.

Brian Warner, principal product planner, Xerox Data Systems, El Segundo, Calif., said: "The more central systems the terminal can be connected to, the more cost-effective it will be."

Warner emphasized that computers must be able to speak to each other and to various types of terminals. This flexibility will meet a variety of consumer needs. And by consumer needs, members of the discussion panel meant not only research scientists, engineers and airlines but also restaurants, hotels, hospitals and families that will use terminals for inventory control of perishable foods, bookkeeping, centralized banking and newspaper information retrieval.

Digital transmission favored

It was generally agreed that digital data transmission would be most effective because it permits the following:

- Conservation of bandwidth, especially with systems such as pulse-code-modulation.
- More error control in a long-haul system because a pulse stream can be regenerated with far greater accuracy than analog signals.
- Greater compatibility for future systems, such as satellites.
- More security—greater privacy—of communications.
- Sharing of the system through use of time-division multiplexing.

Norman Snow, head, wideband data dept., Bell Labs, Holmdel, N. J., noted a major difficulty in going to a digital system: "We are still living with an analog system that took 70 years to build, so we must use modem and standalone terminals to squeeze what we can out of the system."

He was, of course, referring to the present telephone system.

It is questionable whether future data communication systems will operate on the voice-band telephone system that has been created. There are political and economic factors that will shape the future of data transmission.
and these do not involve the solid state.

John E. Cox, assistant vice president, Western Union, Mahwah, N. J., pointed out that "the FCC ruling about two weeks ago prohibits common carriers from getting into the CATV field." And some at the conference felt that data systems of the future will ride on the back of CATV. But—assuming that the common carriers will handle future data systems—there will be changes in tariffs that could affect the design of transmission facilities as well as the equipment at both ends.

Some of the questions asked were:
- "How will magnetic tape cassettes change the nature of data transmission?"
- "How will we handle shared data links on a switched system?"
- "What about costs? Will common carriers offer service on a bit and error-performance basis?"
- "If a CATV network is used, how can inquiries be made? How will that system be made bi-directional?"
- "Can a data network be operated by a number of small competing companies, or must we rely on a major common carrier to assure the uniformity and compatibility required for such a large system?"

Cox said that future terminals would be much more complex than present ones. "They will allow a user to load the terminal and walk away," he said. "The terminal will make sure that transmission takes place."

But what happens in a time-division multiplexed system when an object is rotated to show its three dimensions on a graphic computer terminal? Store-and-forward techniques were suggested by Cox as a possible answer.

Will future data communications transmission use broadband or narrowband systems? Cox said that graphics would be more cost-effective with broadband systems. Warner of Xerox agreed but said that "for alphanumeric systems, you can use narrowband systems to good advantage." And he added: "Putting the 'smarts' in the terminal will not be cost-effective in the long run. But this will probably be done anyway in the near future."

One member of the audience asked about the cost of coaxial switches. Cox said that he knew of coaxial switches that could switch 50 channels individually and could be mounted on a telephone pole.

A huge potential market was foreseen for data-communication systems in education. Several members of the panel humorously suggested that the cost of education was increasing at a rate that might make education in the home via a TV-like terminal a necessity in the next decade.

One member of the panel, noting the transportation, pollution and communication problems that the commuter faced in traveling to work in New York City, suggested that the time and energy might be better used working at home and using data-transmission to communicate with the office.

H. Gene Slottow, professor of electrical engineering at the University of Illinois, was in the audience, and he reported the latest advances in that university's computer-based teaching program, called PLATO. (See "Turn on Designs With New Displays," ED 25, Dec. 6, 1969, p. 71). Slottow said that there were plans to develop 4000 student terminals in dormitories, classrooms and even in homes. There are now 20 such terminals in use at Illinois, he said, and courses have been successfully taught for credit in French, Russian and chemistry.

Snow of Bell Laboratories said that the remote reading of utility meters via telephone-line transmission had been studied at the laboratory in Holmdel and that field studies were being made of the effectiveness of the method.

The feasibility of such a system has been established. The economics remain to be worked out. Meters must be modified, Snow said, to incorporate the sensing elements.

ImpattTs continue their trip from lab to field

Michael J. Riezenman
Technical Editor

High-speed digital communication with millimeter waves has come a step closer to reality with the development of an experimental modulator capable of operating at 300 Mb/s. Developed by a team of researchers from Bell Telephone Laboratories, in both Murray Hill, N. J., and Allentown, Pa., the modulator uses a fixed Impatt-diode oscillator followed by a separate variable path-length modulator (Fig. 1).

By separating the oscillator from the modulator—rather than attempting to modulate the oscillator

1. By separating the oscillator from the modulator, the designers have obtained high-speed modulation without sacrificing oscillator stability.
All-IC consumer products edge a little closer

Don Mennie
Technical Editor

Two new developments described at the Solid-State Circuits Conference bring the day of fully integrated consumer electronics a step closer. The developments are: a high-gain, 15-W monolithic power amplifier and integrated-circuit realization of the standard a-m radio tuning capacitor.

According to Ernest Long, linear integrated circuits engineer with Motorola, Inc., Phoenix, Ariz., there are no fundamental limitations that prevent construction of monolithic power amplifiers. His design—a preamplifier, thermal-protection circuit, ripple filter and two npn power transistors, combined on a single 74 × 75-mil chip—supports this. Long said his 15-W, 80-dB closed-loop-gain IC amplifier would be marketed within a year, and he expects rapid acceptance among quadrasonic stereo manufacturers (Fig. 1).

Heat dissipation is a major problem in IC power-amplifier design. Long’s solution combines two techniques for thermal control: an efficient heat-sink package plus temperature-sensing circuitry.

The IC package design is sufficient to cool the chip under normal operating conditions. When overloads develop, as would occur with the amplifier output shorted, a normally saturated dc amplifier senses changes in the chip temperature. At 175°C, the output of this amplifier rises sufficiently to bring a transistor into conduction, which disables the power amplifier. This thermal shutdown circuit is an intimate portion of the power-amplifier IC and thus responds immediately to overload conditions.

Heat dissipation is a major problem in IC power-amplifier design. Long’s solution combines two techniques for thermal control: an efficient heat-sink package plus temperature-sensing circuitry.

The IC package design is sufficient to cool the chip under normal operating conditions. When overloads develop, as would occur with the amplifier output shorted, a normally saturated dc amplifier senses changes in the chip temperature. At 175°C, the output of this amplifier rises sufficiently to bring a transistor into conduction, which disables the power amplifier. If you are looking for a faster way to turn on and turn off with TTL, we've got news for you.

Our DCL 8800 series is not only faster than 54/7400, but it gives better overall performance. And if speeds of 13ns suffice, you won't have to pay the premium for 54/74H.

So check yourself and see how the 8800 series works for you.

Of course, if you really need that 3 nanoseconds, we've got 54/74H too.

It's just a matter of what turns you on.
A system to provide an IC equivalent to the a-m radio mechanical tuning capacitor was outlined by Philip Thompson, professor of electrical engineering at the University of Ottawa.

Almost completely integrated receiver systems should be feasible, he said, once tuning is incorporated alongside the LO, detector, i-f stages and amplifier on a single chip.

Thompson's approach uses twin-impedance converters to tune and track the ferrite antenna and local oscillator found in a broadcast-band receiver. Each impedance converter has a variable transformation ratio, which allows the impedance of capacitor C appearing across inductor L (see Fig. 2) to be continuously adjusted. This is the tuning control. The transformation ratio depends on the unity-gain amplifier's common-emitter cascode circuit current ratio. Thompson reported two impedance converters fabricated on the same chip would track with fair accuracy.

When questioned from the floor about dynamic range, out-of-band signal rejection and intermodulation distortion, he commented that experimental designs had performed satisfactorily but that complete data was not yet available. He described his work as experimental and exploratory, not yet ready for consumer use.

Color TV on three chips

A panel session on consumer electronics brought out conflicting opinions between IC vendors and color-TV manufacturers.

The panel leader, Neil Frihart, manager of advanced TV development at Motorola, Inc., Franklin Park, Ill., predicted that in six years color TV sets would be built with three chips containing 75% of the circuitry. He was confident that ICs would win the consumer's respect by providing economy, size advantages and reliability not available with discrete components.

Taking a more critical view of the relationship between IC vendors and television manufacturers, Norman Doyle, section manager for consumer applications with Fairchild Semiconductor, Mountain View, Calif., pointed to the 15 different monolithic television i-f strips currently available as evidence of noncooperation. Doyle, who was also skeptical of television manufacturers' budget priorities, said that present outlays for cabinets and picture tubes far exceeded the electronic costs. In the light of such spending practices, he believes IC producers deserve support during the early stages of development, regardless of small price differentials that favor discrete component hardware.

On the other hand, Doyle encouraged IC manufacturers to provide product uniformity that would lead to reliable, low-cost consumer electronics.

Another view on the standardization issue was voiced by Donald Ruby, a microelectronics engineering specialist with Zenith Radio, Chicago. He doesn't want to see the innovative designer shackled by restrictions. "Creativity stops," Ruby argued, "when standardization sets in."

"Partitioning" was viewed by the panel members as closely related to the touchy question of industry cooperation. Partitioning refers to a needed agreement defining which TV subsystems comprise each chip. The grouping of functions (LOs, sync separators, video amplifiers, etc.) appears far from settled.

Gerald Lunn, development manager for custom linear integrated circuits with Motorola, Phoenix, remarked that at least part of the problem was technical. At present, he contended, the "natural partitions" of color television circuitry are just becoming adaptable to IC technology.

Another opinion on the problems plaguing color-television adaptation to the ICs came from Wim Hetterschied, semiconductor applications engineer with N. V. Philips, the Netherlands. He suggested that technical personnel now responsible for discrete component television design were reacting unfavorably to monolithic circuits, since their jobs were threatened by IC advances. Vulnerable engineers react by downgrading ICs at every opportunity, Hetterschied contended.

Responding to audience questioning about flat solid-state television screens, Doyle of Fairchild remarked that the "25-kV firecracker" (standard television tube) would be around quite a few more years. Panel members agreed that interfacing ICs with high voltage is still a problem to be solved.

"Gentlemen, we hardly know you exist."

In these blunt words, Dr. Irving Selikoff, director of the Environmental Sciences Laboratory at the Mount Sinai School of Medicine in New York City, summed up for engineers last month the major problem that medical electronics must overcome before it can expand dramatically: better communication between physicians and engineers on the design of equipment and the role that electronics should be playing in medicine.

Addressing 450 engineers and physicians in San Francisco at the Second National Conference on Electronics in Medicine, Dr. Selikoff alluded to these counts in an indictment of the present state of medical electronics:

- Although modern hospitals use sophisticated electronic instrumentation to care for the critically ill (see "Where EE and MD Link Up to Prolong Life," ED 4, Feb. 15, 1970, pp. 24-28), the new devices are serving only a small minority of patients. Last Jan. 15 at Mount Sinai Hospital in New York, for example, only 4% of all patients in "that most highly automated university hospital" were being treated with the help of electronic equipment.

- The price of electronic equipment is sometimes too high in proportion to the simple job that it can do.

A physician-engineer work session at the conference concluded that engineers could solve nearly all of the problems of doctors if the designers know what the problems were and if someone was willing to pay for the R&D. The need for some kind of national clearinghouse, where information on medical instrumentation could be collected and disseminated, was mentioned again and again.

A need for expansion

That there is ample room for improvement and expansion in medical electronics was clear to conference attendees.

Right now, Dr. Selikoff told his audience, "if all the work you engineers have done in the last 20 years were taken out of the hospital, it really would not make very much difference in the health or disease of the patients there."

He might have added "relatively"—because to the handful of patients who owe their lives to electronic aids, it's a big difference.

The promise of medical electronics was abundantly attested at the conference by booths exhibiting pacemakers, coronary and intensive-care equipment and even some automated medical history-taking systems. One booth advertised the availability of a computer diagnostic system manufactured by Mead Johnson Medical Services, Inc., for pediatricians. But, listening to the speakers and visiting the panel meetings, conference visitors were inclined to agree with Dr. Selikoff that for the vast majority of physicians and patients—both in doctor's office and hospitals—electronic simply doesn't exist yet.

A work session conducted by a private physician and an engineer proved enlightening. The physician, Dr. Lindon Davis, an internist from Williston, Park, N.Y., complained that most of the equipment available to him was as outdated and poorly designed as the wooden tongue depressor. Engineers in the audience countered with complaints that physicians were generally loath to spend the time talking to them about equipment needs, slow to accept new equipment and unwilling to pay a realistic price for it.

The session touched off a lively exchange of ideas between the panelists and the engineers in the audience. But—indicative, perhaps, of another big hurdle that medical electronics faces—only a half dozen physicians showed up for the two afternoons that the session was in progress, against 30 to 40 engineers.
Dr. Davis explained that he uses technicians and instruments to perform as many tests on his patients as possible, but that for many important tests, no equipment is available and he must depend on his own sensitive fingers and eyes to make the diagnosis. For example, he would like to be able to buy instruments that would do the following:

- **Detect blood flow.** In the swollen extremities of some aged patients, he said, it takes him 15 minutes or more to feel with his fingers whether there is any blood flow at all.
- **Detect breast tumors.** Cancerous tissue, said Dr. Davis, is generally a hard, firm nodule buried in the softer surrounding tissue. When the breast is large or contains cysts, it is impossible to tell by touch whether there is cancer or not. In such cases an X-ray of the breast is required, and this takes several days because the X-ray must be interpreted by an expert in mammography. Meantime, says Dr. Davis, “the patient hangs by her thumbs, waiting to find out whether she has cancer or not.” To relieve her mind, he would like an instrument that would tell quickly whether cancerous tissue is present.
- **Determine the patient’s distribution of weight.** If people do not walk or stand properly, they put an unnatural strain on their bones and therefore stress the muscles and tendons. This condition can be compensated for by having the patient wear the proper corrective shoes, Dr. Davis said. At present most doctors determine the weight distribution of the patient by noting what part of his shoes wears out first. But Dr. Davis would like a more quantitative method of determining the patient’s weight distribution.
- **Detect muscle tension.** Doctors use their hands to detect the presence of muscle tension. But an instrument would be useful, Dr. Davis said, in at least two ways: (1) To determine whether an accident patient has a whiplash injury (insurance companies ask proof that the patient is in pain); and (2) To determine whether low back pain and headaches are due to muscle tension or to something more serious.

---

**Why do engineers hate inductors?**

Well, primarily because inductors stubbornly resist integration. Nytronics started taming them about 30 years ago, and our R&D boys have been concentrating on improving their quality and performance ever since. Today we think our line of inductors is the most nearly perfect it is possible to make.

**WEE-DUCTOR** — Magnetically shielded with inductance range 0.1 to 180,000uH, designed to MIL-C-15305, Grade 1, Class B. Encapsulated Envelope: 0.157” diameter x .450” length.

**SUPER WEE-DUCTOR/90537 TYPE** — Manufactured in accordance with MS90537, Molded Magnetically shielded with inductance range 0.1 to 100,000uH ±10% tolerance. Molded Envelope: 0.163” diameter x 0.410” length.

**SUPER WEE-WEE-DUCTOR** — Miniature shielded with inductance range 0.1uH to 10,000uH. Designed to MIL-C-15305, Grade 1, Class B. Epoxy Moulded Envelope: 0.125” diameter x 0.335” length.

**DECI-DUCTOR** — Subminiature with inductance range 0.1 to 1000uH. Designed to MIL-C-15305, Grade 1, Class B. Molded Envelope: 0.100” diameter x 0.250” length.

**S-M-L INDUCTORS** — Non-shielded with inductance range 0.1 to 10,000uH. Designed to MIL-C-15305, Grade 1, Class B. Molded Envelope: “S” Type — 0.188” diameter x 0.44” length, “M” Type — 0.25” diameter x 0.60” length, “L” Type — 0.31” diameter x 0.90” length.

**VARIABLE INDUCTOR** — Unshielded with adjustable range 0.1 to 4700uH. Designed to meet MIL-C-15305, Grade 1, Class B. Encapsulated Envelope: 0.400” diameter x 0.500” length. Vertical or Horizontal mounting.

**WEE V-L** — Magnetically shielded adjustable range 0.1 to 100,000uH. Designed to MIL-C-15305, Grade 1, Class B. Epoxy Molded 0.300” diameter x 0.400” length.

**WEE CHIP-INDUCTOR** — Magnetically shielded, wrap-around termination permitting contact to either face or ends. Designed to MIL-C-15305, Grade 2, Class B. ...195” x .100”. Presently available .15uH to 1000uH.

Huge market growth forecast for British ICs

English consultant predicts their wide use in the computer industry by the mid 70s

Raymond D. Speer
Managing Editor

Rapid growth of IC markets in Britain—especially in the computer industry—a vast growth in consumer IC sales and an increased use of hybrid circuits are forecast by an English design consultant, Alex K. Godden.

An engineer with the Department of Engineering Science at the University of Oxford, Godden predicts a 1973 IC market of $72 million. The hybrid circuit market for that year, he says, will be about $48 million, and the total IC market in Britain and Europe including hybrid circuits, should be $300 million (see table).

These are miniature markets compared with those in the U.S., Godden says, "but the growth trend is very clear. Moreover, our British industries have been re-forming, recapitalizing and putting down firm lines of devices, and 1970 will show another upswing of sales."

Godden feels that the growth rate of the British semiconductor market has been underestimated, to date, by a factor of two.

Computers lead the trend

"It seems that the greatest growth is in the computer central processors," Godden says, "in peripheral equipment and in small office calculators. All of these use ICs, and the trend is toward MSI. The computer segment of the market is now roughly 50% of the total."

"The fields of industrial control, communications, and sub-unit/subcircuits, too, are fast adopting ICs."

Godden sees a somewhat slower growth of IC use by firms dealing with aircraft and general instrumentation.

Although consumer markets have been lagging, until now, Godden expects them to be second only to the computer markets by the mid 70s.

"The automotive field is already using a lot of semiconductors in the form of thyristors and rectifiers," he says, "and I expect wide use of ICs in fuel-injection systems, exhaust control, instruments and intercommunication systems by the mid 70s."

IC acceptance is slow

Management in Europe has been very reluctant to commit itself to the use of ICs. "Let me illustrate the type of thinking that is still running through medium and high technology firms," Godden says. "I worked in the aircraft control and missile simulation field in 1963. My group worked out that a discrete-component control amplifier in an aircraft application then cost $288 over all. An IC version at that time would have cost $300.

"Our management would not agree to reform production techniques, even though we showed that by November of 1964 the integrated discrete version would cost the same amount. (Actually, this happened earlier, in August, 1964.)"

This kind of reluctance is gradually being overcome, asserts the English engineer, but it is still holding up the growth of the IC industry.

Godden sees ICs in general as more and more easily used. "Many components used with ICs," he says, "have been redesigned to be compatible with them. Plate-through holes and double-sized boards are now child's play. And from the designer's point of view, the performance of ICs is better than equivalent discrete circuits, providing one knows how to handle these devices."

Major customers are large firms

Who are the major customers of the IC vendors right now? Godden says that these are usually the larger institutions: industrial firms in the computer, aircraft and instrumentation industries. A smaller group consists of the "expertise" firms dealing in controls, and in-house developments of measuring and control circuits.

Godden sees a good rate of growth in hybrid circuits in Britain in the next few years. "If I were back in the instrument industry I should definitely consider custom-designed hybrids on thick or thin-film circuits, particularly for moderately long runs," he says. "There has been a steady growth in this country over the past 6 to 8 years in hybrid devices."

INFORMATION RETRIEVAL NUMBER 22

Electronic Design 6, March 15, 1970
When you’re really serious about MSI family planning,

To make a Quad Latch that’s both R/S and D compatible,

Fairchild’s new MSI 9314 Quad Latch is a versatile, high-speed device that can be used in any application requiring a single-input D-type latch or an R/S-type latch. It can be used in any application requiring a single-input D-type latch or an R/S-type latch. It can be used in any application requiring a single-input D-type latch or an R/S-type latch. It can be used in any application requiring a single-input D-type latch or an R/S-type latch. It can be used in any application requiring a single-input D-type latch or an R/S-type latch.

The addition of this device to our MSI family gives you everything you need for just about any latching application. Use the 9314 for maximum function versatility. Or the 9308 Dual Four-Bit Latch. When minimum package count is most important. Your Fairchild Distributor has complete specs on both MSI devices.

you have to get serious about MSI family planning.

We put together a family plan by taking systems apart. All kinds of digital systems. Thousands of them. First we looked for functional categories. We found them. Time after time, in a clear and recurrent pattern, seven basic categories popped up: Registers. Decoders and demultiplexers. Counters. Multiplexers. Encoders. Operators. Latches.

Inside each of the seven categories, we sifted by application. We wanted to design the minimum number of devices that could do the maximum number of things. That’s why, for example, Fairchild MSI registers can be used in storage, in shifting, in counting and in conversion applications. And you’ll find this sort of versatility throughout our entire MSI line.

Finally, we studied ancillary logic requirements and packed, wherever possible, our MSI devices with input and output decoding, buffering and complementing functions. That’s why Fairchild MSI reduces the need for additional logic packages.

The Fairchild MSI family plan. A new approach to MSI that’s new as the industrial revolution. It started with functional simplicity, extended through multi-use component parts, and concluded with a sharp reduction in add-ons. Simplicity. Versatility. Compatibility.

Available now. In military or industrial temperature ranges. In hermetic dips and Flatpaks. From any Fairchild Distributor.

Nobody makes MSI the way Fairchild does.

Fairchild’s MSI family plan started with the 9300 Series. Highly versatile, highly compatible devices in seven functional categories: Registers. Decoders and demultiplexers. Counters. Multiplexers. Encoders. Operators. Latches. A minimum number of devices that do a maximum number of things. (Like a register that shifts, counts, stores and converts.)
you don't stop at one family.

Now Fairchild has a new family. Low power MSI. The 9200 Series. All the versatility of the 9300s at 1/4 the power. But low power doesn't mean low speed. Fairchild's new family operates at 5MHz—ideal for military, avionics and industrial low-power, minimum-space applications.

The 9200 family typically features 2mW/gate with 20nsec/gate delay for the optimum trade-off between speed and power. Devices come in both DIPs and Flatpaks. The first six of the economical low-power devices are already in inventory. You can get them today at any Fairchild Distributor.

Here are the first six:

+ 9200 — 4-Bit Register
+ 9208 — Dual 4-Bit Latch
+ 9209 — Dual 4-Bit Digital Multiplexer
+ 9211 — 1-of-16 Decoder
+ 9212 — 8-Input Digital Multiplexer
+ 9228 — Dual 8-Bit Shift Register
Phased arrays: They’re great, but ...

New applications and component developments look promising, but the costs are still too high

Michael J. Riezenman
Microwaves Editor

To a too-casual observer, the age of the phased-array (or electronically scanned) radar may appear to be upon us. But a closer look casts serious doubts on this conclusion.

Among the heralds of the phased-array era—or ESR era, as it's called by specialists—are the following developments:

- RCA has recently announced a series of technical advances that it says can cut the cost and size of phased arrays enough to make possible a new generation of transportable tactical phased-array radars.
- Raytheon is pushing development of ESRS for high-stress airborne applications, where high G-forces make mechanical scanning very difficult.
- The new Aegis shipborne missile system, being developed for the Navy by RCA, will employ a large electronically scanned radar for target detection and tracking.

But this is only half the story. The following facts must also be considered:
- The Navy, although more than pleased with the performance of the phased-array radar on the aircraft carrier Enterprise, is not going to put one on its new nuclear-powered carrier, the Nimitz. Nor is it planning to install a phased-array system on the two Nimitz-class carriers that will follow.
- The computer, which makes possible the effective use of ESRS, has also, in the words of Carl Blake, head of the phased-array group at MIT Lincoln Laboratory, "extended the utility and efficiency of mechanically steered radars, leaving relatively few missions requiring the versatility, capacity and flexibility of the phased array."
- Although the Sperry-built Hapdar at the White Sands Missile Range in New Mexico and the Bendix-built FPS-85 at Eglin Air Force Base in Florida are operating well, no demand for additional large phased-array systems seems to be materializing.

Expense hinders use

Why the contradiction in trends? Are phased arrays good or aren't they?

Yes, they're good, but they're also awfully expensive. Therefore they can be economically justified only for applications where their special properties give them an advantage over mechanically steered rivals. Phased arrays, it therefore seems, will not come into their own until new applications and reduced costs combine to tip the economic balance in their favor.

In what applications is this likely to happen? There are several areas, each of which exploits a different advantage of the phased array concept.

Probably the single most outstanding advantage of phased arrays is that they have no moving parts. Thus they are well suited for missions in space, where the problem of slewing a dish antenna around is quite formidable: It's tough to tell what's moving—the antenna or the spacecraft. And once you get the antenna moving in space, it's pretty hard to make it stop.

Can handle high data rates

Another important advantage that a phased array brings to a radar system is its ability to cope with high data rates. Because beam steering is not affected by any mechanical constraints, great flexibility is available in scanning and tracking. The scan can be extremely fast, and it need not be at a constant angular velocity. Thus an adaptive phased-array radar can be designed to allocate most of its energy to those sectors of the sky in which interesting or potentially interesting objects have been detected. At the same time it can maintain routine surveillance over the rest of the sky.

By contrast, the inertia of a rotating antenna makes it very difficult to change its angular velocity; it wastes a significant fraction of its resources looking at uninteresting volumes of space.

The array of elements that comprise a phased array antenna can be excited to form many beams and thus can track several objects, each with a different pulse repetition frequency if necessary, while maintaining surveillance over a whole volume of interest.

Versatile air-defense potential

In an air-defense application, if a high-speed object is found to be

![Diagram of phased-array antenna](image-url)

1. Background clutter is reduced with this phased-array setup that can scan 360° without a moving beam. A multiple-beam approach is used. Note that each radiating element in the diagram is a complete beam-forming antenna.

36 ELECTRONIC DESIGN 6, March 15, 1970
Two approaches for generating the power: the "big bottle" approach (top) and the individual-amplifier approach (bottom). The relative costs of high-power phasers and power amplifiers will determine the best way to go.

heading toward the defended area, the radar might be designed to concentrate a lot of its energy on that object. It would update the position data on the object many times a second, to get a precise track on it. Then the system could make a decision about the nature of the object and the appropriate action to be taken, if any.

If the object turned out to be harmless, the radar would immediately cease allocating to it the large amount of power-aperture product needed for a precise track and would merely maintain a coarse track for bookkeeping purposes. Bookkeeping is necessary so that the radar doesn't squander its resources doing a fine track on the same object every time the search beam detects it.

In this type of application the phased-array approach wins out over the mechanically scanned method when the total data rate—which increases with both the number of expected targets and their speeds—becomes too high for the mechanical system to cope with. It should be noted, of course, that several mechanical systems can be operated together, and so the exact crossover point is not easy to define.

For example, the aircraft carrier Enterprise is outfitted with a phased-array radar system that takes the place of several rotating-dish radars. But the new Nimitz carrier will go back to the old multi-radar approach simply because its four mechanically scanned radars will be cheaper than a single phased-array system.

Eyes on the back of its head

Besides space applications and in very-high-data-rate situations, phased-array techniques can also be helpful in moving-target indicator radars. The multiple beam-forming capability of the phased array makes it possible to use a "searchlight" approach in looking for targets. Many stationary beams are formed, each aimed in a different direction. Scanning is accomplished not by moving the beams but by sequentially examining each beam's return. Since the beams do not move, background clutter is minimized.

Moving-target indicator radars detect only moving targets. But a scanning beam simulates motion, and hence makes even stationary backgrounds show up as clutter. The faster the scan speed, the wider the clutter bandwidth and the bigger the problem. By continually searchlighting an area, a phased-array radar can reduce the stationary-clutter bandwidth almost to zero. And in the words of Dr. John L. Allen, associate head of the Radar Measurements Div. of the Lincoln Laboratory, "that's the finest way in the world to make a moving-target indicator radar."

The radar can be made fairly inexpensively by building only one transmitter and one receiver and time-sharing them between the array elements for each beam (Fig. 1). A signal-processing unit is needed for each beam position. Two synchronized commuting switches connect the signal processors and the beam-forming arrays to the transmitter-receiver combination at a very rapid sequential rate.

The beauty of this scheme, Dr. Allen explains, is that each signal processor thinks that it is the only radar in the world and that it's operating at a PRF equal to the system PRF divided by the total number of beams. In a system that he built, Dr. Allen had 32 beam positions and a commutation rate equivalent to a mechanical scan rate of 10,000 rps.

Fighting high G forces

Fast-moving, highly maneuverable aircraft impose stiff mechanical requirements on their radars. If a plane makes a 3-G turn in a dogfight, it better have some hefty motors on its mechanically steered radar antenna, or the dish will simply be pegged to the outside of the turn until the maneuver is completed. Now as David O. Lavoie, Marketing Manager for Advanced Avionics at the Raytheon Co.'s Missile Systems Div., Bedford, Mass., points out, big motors are heavy. And every extra pound of radar can lower the system cost, avionics equipment means about six more pounds of aircraft.

Thus if an over-all systems viewpoint is used—with the aircraft as the system—it may turn out that phased-array radar can lower system cost, even if the ESR is more expensive than its mechanically steered counterpart.

Lavoie also explains that phased arrays can be designed to conform to an airplane's fuselage shape and that they are more reliable than mechanically steered radars. The hydraulic motors have reliability problems, he says, because they are susceptible to failures caused by dirt that gets into their oil lines.

Because they have no moving parts, electronically steered radars can be made much "harder" than conventional radars. The radiating elements can be mounted in cavities in a massive steel plate and protected by concrete. Extensive trusswork—too heavy to be used in a moving system—can be employed for increased strength. Strength, then, is another advantage, especially for fixed military applications, such as Safeguard.

But what price strength? And what price all of the other advantages of phased arrays?
The high costs of the low-loss, high-power phase shifters and their drivers make the “big bottle” approach (Fig. 2, top) extremely expensive. An oversized oscillator tube must be used to make up for the power lost in the feed and the phasers. This is not only costly in itself, but it also adds to the power and cooling system requirements.

The individual-amplifier approach (Fig. 2, bottom) avoids the costs associated with the high-power phasers, but it substitutes the costs of a large number of power amplifiers. What can be done to reduce these costs? Two important approaches stand out:

- Use fewer components.
- Reduce the component costs.

The first approach, quite literally, is to use fewer components in the array. One well known example of this is the thinned-lens Hapdar (Hard Point Demonstration Array Radar) built by the Sperry Gyroscope Div. of Sperry Rand Corp., Great Neck, N. Y., for the White Sands Missile Range. This radar has a 30-foot-diameter lens aperture with 3750 radiator positions. To save money, however, only 2165 of these positions are occupied by active radiators. The others have been replaced by dummies. The dummies are resistively terminated to maintain proper matching.

By carefully randomizing the

A 90-second primer on phased arrays

Very briefly, a phased array is a collection of simple radiating elements arranged over an area called an aperture. The elements are excited from a common source, so that phase coherence is maintained.

A beam (or beams) can be formed from the superposition of the radiation from all of the elements. By varying the relative phase of the signal applied to each element, or the frequency of the main oscillator, the direction in which the beam is aimed can be adjusted.

The simple idea described above can be implemented in a great many ways. For example, the rf power can be delivered to the aperture through either a space (optical) feed or a constrained feed. The two basic types of space feed are the transmission, or lens type and the reflection. In both rf energy from a feedhorn illuminates the aperture, much as a conventional parabolic reflector is illuminated.

The reflection array accepts the energy, bounces it off an array of reflective phase shifters and re-radiates it from the same side of the aperture. An advantage of the reflection array is that the aperture thickness is not limited—there’s plenty of room for the phase-shifter driver circuitry. A disadvantage is the partial aperture blockage caused by the feedhorn.

The transmission array eliminates the blockage problem by accepting energy on one side, passing it through the array of phasers and re-radiating it on the opposite side. Unfortunately this approach doesn’t leave much space for the drivers.

Both types of space feeds have a common problem: They take up a lot of room. Typically, optical considerations make it necessary to have the distance from the feedhorn to the aperture about equal to the aperture diameter.

This large-volume problem can be tackled by going to a constrained feed. This would in most cases be a waveguide arrangement that routes the energy to each phaser in the aperture. The corporate feed (illustrated) is quite common and has the property that all of the path lengths, from the rf input to the radiators, are equal. Corporate feeds are more expensive than optical feeds, and they introduce extra losses.

There are two basic approaches to providing the power in a phased array. In the “big bottle” approach, all of the rf power is generated by a single high-power tube. The competitive approach is to feed all of the phasers with low-power microwave energy and then have a separate power amplifier follow each phaser.

Clearly, the phasers are very important devices in any phased-array system. A key question that comes up at the system design level with every ESR is whether to use diodes or ferrite devices as the phase-shifting elements. Ferrite devices are generally more reliable but also more lossy. Diodes can be switched more rapidly and with less power. Each situation is different, but recent designs tend to employ diodes at the lower frequencies and ferrite phasers at the higher ones.
a little **blue** pill for budget blues

**BOURNS MODEL**

3365

½” **wirewound adjustment potentiometer**

Tense? Wrought with anxiety over lowering the cost on printed circuit board assemblies? Here’s the prescription: Bourns Model 3365, a ½” high-quality single-turn wirewound.

Consider the ingredients: resistance range from 10 to 50,000 ohms, with a ±5% TR tolerance; power rating of 1 watt at 25°C; sealed to withstand fluxing and soldering operations; noise-free operation. Meets MIL-STD-202 for steady-state humidity and MIL-R-27208 for shock, vibration and load life. It’s easy to take: two-way adjustment, by thumb or screwdriver; $1.21 in 1,000-piece quantity for low profile (.24” high) to adjustment model; $1.58 for the side adjust.

Additional information on Model 3365 is as close as your phone. Call your local Bourns sales office, or your Bourns distributor . . . he has it on the shelf.
NEWS
(phased arrays, continued)
position of the dummy elements, the designers have blocked changes in the antenna beam pattern; the thinned array has the same beamwidth as a full 30-foot array. The antenna gain, on the other hand, is reduced, because it is a function of the number of active radiators.

Cutting components costs
Considerable progress is also being made in component cost reduction. For example, RCA recently announced the development of a dielectric-loaded phase shifter that it estimates will reduce phaser costs by 25% over previous designs. Dr. Arthur S. Robinson, manager of systems and advanced technology for RCA's Missile and Surface Radar Div. in Moorestown, N. J., explains that the new phasers are smaller and that this will lower their production cost.

RCA has also developed a reduced-cost driver for the phase shifters. Dr. Robinson explains that the use of hybrid integrated circuits provides the savings in this area.

Despite these developments, component costs remain a big problem. And many experts, such as Daniel R. Stettin, chief engineer at the Combyte Corp., Farmingdale, N. Y., feel that the problem won't be solved until production volume grows. High-power phase shifters, for example, are simply too expensive in small quantities. But high-volume production might reduce the price of a $500 phaser to, say, $100.

Is solid-state the answer?
In the individual-amplifier approach to array design, the key cost element is the amplifier. The hope here is that the costs of transistors (or other solid-state devices) will come down far enough to make the approach competitive with the "big bottle" approach.

Actually no one really seems to think that solid-state power generation can compete with high-power vacuum tubes on a direct dollars-per-watt basis. Rather the argument is that the reliability of solid-state devices will make them cheaper to use over the lifetime of the system, because maintenance and operating costs will be reduced.

Not everyone will buy that argument. Lincoln Laboratory's Carl Blake, for example, observes: "Skeptics argue that the reliability of solid-state devices is far from resolved, especially for the types of semiconductors that must be used for microwave power generation. They argue further that even if these devices do have extraordinary long life, their high initial cost will never be offset by reduced maintenance costs."

In a further comment on statements hailing the reliability of solid-state devices, Blake says: "Three hundred fifty people man five shifts on the FPS-85 [the big phased-array space tracker at Eglin AFB]. Of these 350, only about 20 are assigned to the transmitter. Other than the transmitter, the FPS-85 is all-solid-state."

Blake isn't too sanguine about solid-state devices for radar power generation for another reason: They are peak-power limited.

Unlike vacuum tubes, which can have peak-power capabilities that are many times larger than their average power ratings, the peak-power and cw-power ratings of transistors are essentially the same. Even the Gunn, Impatt and LSA devices fall into this category for pulses longer than a few nanoseconds.

Because of this peak-power limitation, solid-state radar transmitters must operate with very high duty cycles (20% to 30%) to put enough energy onto their targets for acceptable performance.

This means that expensive pulse-compression processing, either analog or digital, is needed in the receiver to get the range resolution obtainable with low-duty-cycle transmitters. This hidden cost is quite real and may often be overlooked in a quick cost comparison, Blake points out.

Another disadvantage associated with high duty cycles is that they create severe scheduling problems. By substantially reducing the available listening time, they make it difficult to parcel out optimally the radar's resources among its various targets. Even with fairly good filters, Blake says, you don't want to listen for a return on one frequency while you're transmitting on an adjacent one.

But perhaps the biggest drawback of the high duty cycle is that by using up a lot of time to transmit energy, it reduces the time available to collect data. And this compromises the greatest strength of the phased array—its ability to handle very high data rates.
By the time you hear the blast-off, the sled is gone. The new record is 8183 feet per second.

Wanted: Memory for sledding at Mach 7

Story and photographs by John F. Mason, Military-Aerospace Editor

How do you telemeter data from a ground vehicle that's moving at 5580 miles an hour—Mach 7.4?

Answer: You don't.

Mach 7.4 is 8183 feet a second. At 6000 feet a second, metal antennas begin to heat up and erode, and an ionization sheath forms that blocks radio transmission.

Solution: Probably the use of rugged core memories with data-compression circuits, packaged to withstand the punishment at Mach 7.4 and beyond.

The problem has arisen at Holloman Air Force Base in the New Mexico desert, where the military has for years been using rocket-propelled sleds to test what will happen to equipment—anything from spacecraft to small electronic components—during space travel, re-entry and sometimes impact.

Acceleration into and out of space can subject a piece of hardware to 200 g's. Heat is so intense that it melts nose cones or vital parts of a missile or craft. And vibration and shock can disintegrate electronic components and aerodynamic structures alike.

To control and measure these forces is vital. And doing it on the ground is easier than in space.

Recently a Chaparral sled equipped with 15 rocket motors hit the Mach 7.4 speed. And the next goal, says the Chaparral's builder, Lockheed Electronics Co. of Plainfield, N. J., is 9000 feet a second. These runs must carry instruments and acquire data.

W. M. Sanders, chief of the Instrumentation Div. at Holloman, where the sleds run on both single and double rails, puts the problem simply to designers: "When your telemetry transmitter antennas erode or burn up altogether, you don't get any data."

Even without the higher speeds, telemetry from ground sleds has always been a problem. The signals frequently split up, at any supersonic speed, causing multipaths that can confuse analysts who are trying to piece together data from the test.

To avoid telemetry altogether, Holloman tried putting tape recorders on its high-speed sleds to store the data until the ride was over. But the recorders burned up.

Now, engineers at Holloman are planning to try a new technique: core memories with data-compression circuits. If the memories can be built to hold up under the rigors of the ride, they can pour several million bits of information from each ride into a computer at the test center.

Proposals for the memories are in, and a choice for an industry contractor will be made soon.

Hardware tested at Holloman may be bugged by as many as eight transducers, although the usual number is three. Until the core memories are operational, telemetry will have to be used and the speed of the sleds will have to be held down. Telemetry operates in the 1400 MHz and 2200 MHz regions. The signals are usually fm, using PCM, PAM or PDM modulations. The receiver is halfway down the length of the track.
Extend standard cell design to bipolar arrays

Fairchild Micromosaic technique developed for MOS LSI, now applied to LSI bipolar arrays

Elizabeth deAtley
West Coast Editor

Fairchild has extended its standard-cell Micromosaic approach, originally developed for MOS LSI, to bipolar LSI arrays with two and even three layers of metal. In Micromosaic, predesigned cells are laid out on the chip and interconnected by computer. Turnaround times of 12 to 16 weeks from acceptance of the order to shipment of prototype parts are allowed, says Robert F. Wickham, product marketing manager for advanced bipolar digital products, Fairchild Semiconductor, Mountain View, Calif. A complete custom design takes at least twice as long, he notes.

At the present time, the technology is implemented only with standard TTL, he points out, but it will be extended during 1970 to other circuit types, such as low-power TTL. To minimize system cost, standard packages and standard package techniques will be used, he says.

At least one customer has already ordered a system that uses this new technology in part. The system is a 5-chip military airborne computer, says Wickham.

By the end of March, he says, Fairchild expects to have enough cells in its library to implement 75% to 80% of all customer bipolar designs in Micromosaic, and 95% by the end of the year.

The first standard Micromosaic bipolar product—a 4-bit arithmetic logic unit containing about 60 gates—will be announced in mid-April, says Wickham.

Although a Micromosaic chip may be slightly larger than a completely custom device, he says, this difference is "more than offset by the reduction in engineering costs and the competitive advantage it gives us to get the product on the market faster."

Chip made with standard-cell techniques marks Fairchild's entry into the field of bipolar Micromosaic. By March, the company expects to have enough cells in its library to implement 75% to 80% of all customer designs in Micromosaic, and 95% by the end of the year.

Until recently, Fairchild produced its bipolar arrays either all-custom or by Micromatrix. In the Micromatrix approach, wafers that contain a fixed pattern of standard cells are processed up to the point of metallization and stockpiled. Then when the customer orders a specific array, the cells are interconnected with one or more layers of metal, diced, packaged and shipped. The total turnaround time for Micromatrix is considerably faster than for Micromosaic, says Wickham (8 to 12 weeks compared with 12 to 15), but the technique requires about one-third more silicon area and therefore is not suited to LSI complexities. Fairchild will continue to use this technology, says Wickham, for MSI levels of complexity (30 or 40 gates).

The Micromosaic approach was first developed for MOS, when it reached the LSI levels of complexity that normally require custom design, Wickham says. Because of steadily improving process techniques, the bipolar technology is now reaching these levels of complexity. In fact, says Wickham, it has doubled in complexity in the past year. "Right now," he points out, "we're looking at bipolar designs in the 100-gate area, and by the end of the year, we expect to reach 150 to 175 gates per chip."

In general, Wickham says, a piece of logic that contains 100 gates or more is unique to a single system and therefore must be custom-designed. This is costly and time-consuming. Furthermore, he points out, since a large part of the logic system can be put on a single LSI chip, the design of the chip should be considered during the course of the system design to arrive at an optimum tradeoff between the total number of chips and the area per chip. As a result, customer/manufacturer interface becomes a problem. Micromosaic relieves this problem by helping the customer to design his system for ease of chip layout, testing, and manufacture.
Now you can have a time-share terminal that lets you see your data graphically—instantly—as it prints out on your Teletypewriter. Now you can plot for comprehension, for meaningful report illustrations, for permanent records. And do it while the time-share data's coming in.

The HP 7200A Graphic Plotter is the first major advance in time-share flexibility since the Teletypewriter itself. The Graphic Terminal feeds from standard EIA ASCII inputs and automatically plots computer data in points, lines, curves, bar graphs, pie charts, or any other useful engineering, mathematical or business graphics you need. Plot directly from the Teletype keyboard, too, or silence the Teletype-writer and use the plotter alone. It's the end of the graphic time lag. The HP 7200A is easy to use and requires no special operating or programming/language knowledge. It plots smooth lines, not the staircase drawn by the incremental recorder. And it lets you position the graph where you want it on any type or size of graph paper up to 11” x 17”.

Talk to your time-share service about Hewlett-Packard's new 7200A Graphic Plotter. If your service doesn't offer it yet, have them give us a call. The Graphic Terminal. For people who can benefit from a dash of art with their cold hard data.
TI's quiet revolution in optoelectronics
Improve cost/performance ratios with the speed of light.

Start with lower costs. TI brings optoelectronics prices into line by standardizing to meet the specifications most designers need.

Then compare performance. TI devices are 20 times more reliable, 1000 times faster than their costly electromechanical counterparts. Simple circuits. Low voltage. Low current. Low cost.

New low cost phototransistors... with features you'll find in high-priced components. Exclusive alignment flange. Metal can. Two leads sealed to glass and mated for standard TO-92 sockets.

Rugged. Easy-to-mount. Yet, priced below comparable 100% epoxy devices. 67¢ in 100s.

And, the new TIL63 through TIL67 phototransistors offer sensitivity ranges from 0.4 to 10 mA and above.

Ideal for reliable controls, switches, recognition equipment. For detailed specifications, circle number 231.

Visible light emitting diodes... standardized and in volume production. So the cost is low. As little as $1.27 in 1000 lots.

And, you can measure TI VLED life by the decade.

For detailed specifications on improved TIL201 and TIL202, VLEDs, circle 232.

New rugged coupler/isolator... replaces costly, high-voltage hardware.

It could be a tiny pulse transformer. Put it on a high-density PC board. Couple it to 1000 volts. No problem.

Resistant to extreme shock, vibration and temperatures. Rejects noise. Eliminates ground loops.

Increase system flexibility. Replace heavy components in data transfers, system interface, even in motors.

And, cut your system costs. For more information on the new TIL107 and TIL108 coupler/isolators, circle number 233.

New P-N GaAs emitters... powered up and priced down.

Up above 1 mW output. Down to $2 in 5000s.

New TIL23 and TIL24 emitters offer the performance you need for cost-critical tape readers, velocity indicators and character recognition.

Save space, too. Small size makes them easy to place at 0.087", center-to-center... now required for new card readers.

For more information, circle 234.

New x-y hybrid sensor arrays... the ideal solution: low cost, high performance.

TI's working on it.

The 50¢ channel in large volume. Medium-density arrays that will gain reliability by magnitudes over conventional hybrid techniques.

Standard plug-ins of 50 or more sensor elements. Spaced down to 50 mils, center-to-center. Light current matched to within 50%.

TI is ready to discuss your custom requirements. Write now.

7-bar numeric display... now in development. In volume production later this year.

The prototype is in the works. It's shown at left with the plastic cover off to reveal rugged construction.

Talk over your needs. Write TI today. New TI phototransistors, VLEDs, coupler/isolators and emitters are available now. Call your local TI sales office or authorized distributor.

For detailed specifications, circle the reader service numbers. Or write: Texas Instruments Incorporated, PO Box 5012, MS 308, Dallas, Texas 75222.

Prices are manufacturer's suggested list; subject to change without notice.
a Dana DVM for $425

Designed and developed by the same people who build our $6,000 instrument... and our $5,000 instrument... and our four, three, two and one thousand dollar instruments. No wonder it's so good.

Dana's new 3800 is the most accurate 3-digit DVM on the market. But it's more than a DVM. It's a full multimeter that will measure dc volts, ac volts, ohms, and dc current—with even a BCD option available. Superimposed power line hum is rejected by 1,000 times. It's so stable that it will run for over 6 months without calibration. So insensitive to temperature and humidity that you can use it anywhere without affecting performance, and its case is made of Cycolac®, the same rugged material used in professional football helmets.

Our reputation rides on the 3800. Just as it rides on every other DVM we make... for use on the bench and in systems; militarized models; 4- and 5-digit; from $350 to over $8000. There's a lot more to the Dana story, and to the 3800, so write for it. We'll also tell you how you can qualify for a free trial.

Dana Laboratories, Inc.
2401 Campus Drive, Irvine, California 92664

Cycolac is a registered trademark of Borg-Warner Corp.
DOD prepares Senate for Safeguard fight

To improve chances of getting the Congressional go-ahead on further development of the Safeguard antiballistic-missile system, Defense Secretary Melvin R. Laird devoted an extra day to the subject during his two-day military posture statement to the Senate Armed Services Committee and the Defense Appropriations Subcommittee.

Getting on with the ABM system, Laird told Congressmen, was necessary because of the growing "Soviet threat to our land-based forces and because of the potential Chinese threat."

To counter anti-ABM forces in Congress who say the all-important Safeguard radar is so vulnerable to attack that the system's effectiveness is doubtful, Laird suggests initiation of a program to "develop more survivable radar."

In order not to unsettle anyone with massive whole-program cost figures, Laird talked in terms of a year-to-year approach to advanced weapon development—a point of view that will apparently be used in future Defense thinking.

A new communications market: Yugoslavia

Big news for international electronics suppliers is a $40-million loan by the World Bank for an expanded telecommunications network in Yugoslavia, which plans a 7-year $470-million program to improve its total telecommunications services. The $40-million loan is part of a $95-million project—the remaining $55-million to be derived from suppliers' credits. The World Bank, an affiliate of the United Nations, requires that proceeds of its loan be spent outside the borders of the recipient and that bidding be international.

According to a World Bank official, external-circuit facilities required in the over-all program include an Intelsat type of earth station to permit long-range satellite relay, a high-capacity microwave system including eight main links, plus associated branches, new transmission centers in 17 main transit exchanges, and a major coaxial cable. The earth station, he says, will cost more than $4-million and will use a 30-meter-diameter antenna.

The loan represents the first crack in a wall erected by the Soviet Union preventing Communist-bloc nations from joining the Intelsat consortium.

Navy needs raft of money to survive

“We're watching our seapower go straight down the drain, and I don't think the American people give a damn,” declares John R. Blandford, House Armed Services Committee chief counsel. Over $20 billion is required during the next five years to rebuild the Navy's aged fleet, he told a recent Navy League symposium here.

The Administration is asking $2.7 billion for new ships and fleet modernization in the fiscal 1971 budget—an increase of $500 million over the fiscal '70 figure. With that amount, says Blandford, "Anyone who
understands the need for rebuilding our Navy knows it can't be done.”
To stay abreast with the Soviet Union, Blandford estimates a funding
need of $4 billion a year for the next five years. Extra shipbuilding
authorizations will again be sought by the House this year, but industry
informants here are not optimistic of Senate approval.

Environmental needs speed Patent Office aid

The urgent need to control our deteriorating environment has become
so well accepted that it has penetrated the thick pile of red tape within
the U.S. Patent Office. Commissioner William E. Schuyler, Jr., director
of the office, says that patent applications related to environmental
control will henceforth be processed in “six to eight months” instead
of the usual three year waiting period.

Patent officials disclose a normal backlog of well over 200,000 applica­
tions pending, with about 5 per cent of this number falling roughly into
the environmental category. To obtain higher priority for the environ­
mental type of patent, they ask inventors to identify the nature of their
submissions clearly and send them directly to Commissioner Schuyler.
The same identification information should also be transmitted to his
office for patents pending to obtain earlier processing.

Congress wants wider use of government inventions

A movement is under way in Congress to enable the Government to
get more income from inventions derived from Government-supported
research by making them more available to industry and charging more.

Now, if a company stumbles on an invention that the Government has
paid another company or a university to produce, it and other companies
are free to use it for a small fee. Needed, says Sen. Jennings Randolph
(D-W. Va.), is a more effective way to disseminate news of inventions
and Government-owned patents to industry.

Carrying Congressman Randolph's suggestion a step further, Dr.
Harvey Brooks, Chairman of the National Academy's Committee on
Science and Public Policy, proposed to Congress that a new Government
agency be established to publicize Government-owned patents and to
grant exclusive licenses to companies for a limited duration with the
Government receiving a negotiated share of the royalties.

Broadcasters to get domestic satellite study

A comprehensive study of ground vs satellite-relay systems for
domestic radio and television broadcasting is under way here for the
major networks by Page Communications Engineers, Inc., a subsidiary
of Northrop Corp. The four-month study will provide ABC, CBS, and
NBC with both technical and economic comparisons of the two alterna­
tives.

“The reason for the study,” says John Gardella, Page vice president
for marketing, “is to determine whether an all-ground microwave system
or a satellite system with active repeaters is more economical than the
existing systems.” The firm will analyze both initial costs and long-term
operating costs.
Molded epoxy encapsulation. Precise dimensions. Mounting feet. Welded leads. That's what makes the GE Black Hawk unique. What does this mean to your printed circuits? You get built-in "damage resistance" to vibration or shock with an epoxy case that also stands up to any soldering iron. You get the best utilization of circuit board space in grouping or single components with precise dimensions in case and lead location. Mounting feet elevate the body of the unit above the circuit board giving Black Hawk capacitors greater stability during dipping. Secure welding of the leads to the extended foil of the roll gives you a low dissipation factor and a firm electrical as well as an exceptionally strong mechanical connection.

The automatically insertable Black Hawk capacitors are available in electrical as well as an exceptionally strong mechanical connection. Temperatures Ratings: Capacity Ratings:

- Temperature Ratings: Capacity Ratings:
  - 50V: 0.001 μF to 1.0 μF (50V), −55°C to +85°C (and +125°C with proper derating)
  - 200V: 0.001 μF to 0.6 μF (200V)
  - 400V: 0.001 μF to 0.6 μF (400V)
  - 600V: 0.001 μF to 0.6 μF (600V)

For further details, call your GE Electronic Distributor or GE ESO District Sales Manager, or write Section 43041, General Electric Co., 1 River Road, Schenectady, N. Y. 12305.

Electronic Capacitor & Battery Dept., Irmo, S. C.
See these new Burr-Brown products at IEEE (BOOTH 3A26-27)

New low cost A/D-D/A Converters
An all-new line of high-speed converters priced from $119.00. 8, 10, and 12 bit units are available among 14 A/D and 17 D/A models. Modules are self-contained, requiring only input signal and power supply.

New $27.00 Multiplier
A high-speed multiplier with accuracy adjustable to ±1%. Low 100 unit price of only $27.00.

New Square Rooter
This unique function module will square-root with an accuracy of ±0.5% of full scale with wide dynamic input range of +3 mV to +10V. And, the 100 unit price is only $39.00.

and over a dozen new amplifiers

- 4 new Electrometer Amplifiers with varactor input. These inverting and non-inverting units have a bias current of only .01 picoamps and a 10^14 input impedance.
- 5 new Hybrid IC Op Amps including 2 DIP FETS and 3 DIP bipolar.
- Four IC Op Amps to MIL-STD-883.
- A new low power Instrumentation Amplifier.
- New Differential input chopper Op Amp with ultra-low drift and high common mode rejection.
- New Line Drivers offering ultra-fast slew rate and wide bandwidth while driving 50Ω load. Output current ±100 mA.

Is Your Computer Doing Things For You... Or To You?

The New Heath 801C Computer Logic ADD™ Broadens Your Understanding

What Is Your General Purpose Computer Doing?
Is it doing things for you in your problem solving that make the job easier, faster, more accurate? Things like analyzing, processing, measuring...working as an integral, active part of your design process? Does your knowledge of how your computer works, and what it can do, enable you to significantly alter your view of the problem...to the point of finding a better solution? Or is your computer, by being something of an enigma, doing things to you...like wasting your valuable time...increasing costs...degrading the accuracy and repeatability of your results? Is your computer doing things for you...or to you? The New Heath 801C System Can Help You Find Out...by broadening your understanding of computer logic. The Computer Logic ADD is designed to give you the basic knowledge of computer logic you need to effectively use the computer as a functional part of your designing and problem solving methods. The 801C System consists of the new EU-801C Computer Logic Analog-Digital Designer (ADD), a pioneering new text, "Digital Electronics For Scientists", by Drs. Malmstadt & Enke, and a Workbook keyed to the text and written to lead the newcomer a step at a time through basic logic functions and methods of manipulating data.

The EU-801C Computer Logic ADD is a precision teaching and design device composed of three Modules...Digital Power, Binary Information and Timing. Plug-in circuit cards in the Modules contain discrete logic functions such as AND, OR, NOR, NAND, INVERT etc., and the solderless connectors on the top of each card allow the user to patch the cards together with ordinary hook-up wire to form logic subsystems and systems identical to those used in present computers. Standard logic symbology is used throughout the system so the cards can be connected according to common logic diagrams. The ADD is also completely open-ended...more complex circuit cards are available from Heath to provide design & self-teaching capability for computer interfacing, digital instrumentation and control functions.

The Workbook, written by Drs. Malmstadt & Enke, is applicable to anyone interested in learning basic computer logic concepts and functions. The Workbook contains descriptive summaries, textbook references and specific instructions for 50 experiments. The experiments systematically "open up" the computer so that its basic logic functions and data handling methods become clearly understood. The format, experiments and presentations are designed for self-teaching and self-checking of one's comprehension. Table Of Contents by chapter: (1) Gate Logic...the student becomes familiar with logic levels, truth tables, Nand/Nor gate logic, Boolean Algebra, and encoder, adder, subracter, decoder, multiplexer, comparator, parity and relative magnitude detector circuits and functions. (2) Flip-Flops...one of the most basic logic functions, used in all types of registers, for buffer storage, counting, converting, scaling and many other computation and measurement applications. (3) Counters & Scalers...including BCD counting, decade counters, scalers, variable modulus counters and preset counters. (4) Shift Registers...this set of experiments illustrates all the basic shift register circuits and applications. (5) Counting Measurements...this chapter demonstrates the use of counters to measure frequency, period and time interval. (6) Binary Computation...including serial and parallel addition and subtraction, which are the basis for all types of computation in actual computers.

Text—"Digital Electronics For Scientists" is a complete, up-to-date reference and study text for modern digital logic techniques. Although only the non-electronic portions of this text are used with the 801C System, the complete text offers an invaluable source of information for those interested in probing further into the nature and uses of current digital techniques.

The New Heath 801C System...can be the key to making your small computer an active, functional part of your design process. Order your 801C System now...and discover that your computer can be doing things for you, instead of to you.

EU-801C, complete system ............................................. $365.00*
step up!

Come on, gentlemen! Let's fight anarchy

Sir:

With regard to the article “Design Digital Converters Logically” by Messrs. A. H. Frim and M. M. Miller (ED 24, Nov. 22, 1969, p. 66), I would like to comment that a DTL 930 gate is a “NAND” gate, regardless of what symbol is used to describe it. In Figure 1, the authors erroneously labeled this device a “NOR” gate.

Reference to MIL-STD-806B will readily show that the two top symbols in Figure 1 are identical—that is, if we stick with positive logic for both circuits, which is, I am sure, the intent of the authors. In addition, the expressions

\[ F = ABC \]
\[ F = \overline{A} + \overline{B} + C \]

are all identical and describe a NAND function. The equivalent expressions for a NOR function would be

\[ F = A + B + C \]
\[ F = \overline{A} + \overline{B} + C \]
\[ F = \overline{A}BC \]

Come on, gentlemen. Let’s stick to convention, and let’s fight anarchy.

Jeffrey Lowenson
Versatran Division
AMF Thermatool, Inc.

Puts love of work over community obligation

Sir:

During the months of August and September of the past year, I, with others, put in an average of 16 hours a day, seven days a week, on a project that was behind schedule. I did not receive any overtime pay, and I was not working under the influence of promises or any other form of compensation. I was working to get the job finished in the shortest possible time, using the resources available.

I consider myself to be one of those “creative ones” Dr. Ehricke refers to in his interview in the December 20, 1969, issue (ED 26, p. 76). However, my drive during that two-month push did not come from a “sense of obligation to the community,” as Dr. Ehricke suggests. It came from my love of my work.

I will not work for the community since the community cannot pay me, and I believe in value given for value gained. I do not recognize any right of a community, society, humanity, or any other alleged consciousness, to my work. My work is for my benefit first, the company’s benefit second, and the customer’s benefit third. The community benefits from my work as it does from the work of other creative men, but only indirectly. It is not a true motivating factor.

If you and Dr. Ehricke think that man truly works for the benefit of the community, look around you. The men who expected the community to pay them quit working a long time ago. The proof of this is in today’s great emphasis on having fun. If a man enjoys his work, he does not have to look outside of it for pleasure. And pleasure is a motivating factor.

Edward W. Rummel
Senior Project Engineer
Western Reserve Electronics Inc.
Cleveland, Ohio

In response

Sir:

I read Mr. Rummel’s comment with interest. In particular, I found it intriguing that my reference to a “sense of obligation to the community” was unreservedly taken as being in opposition to one’s “love of work” or to the undeniable fact that “pleasure is a motivating factor.” Clearly, these two attitudes are not mutually exclusive. I believe my individualism to be second to nobody’s. Neither, I am sure, did Mr. Rummel, in denying that the community’s benefit is a motivating factor while claiming that “My work is for my benefit first,” mean to proclaim a man’s right to enjoy his work regardless of its effect on the community.

Without finding a sense of obligation to community an enjoyable aspect of his work, I am afraid neither individual nor community can flourish in the long run.

K. A. Ehricke

Today’s youth ‘ideal’? He calls them ‘fools’

Sir:

I had a rather violent reaction to your editorial “Any of You Evil Engineers Ready to Defend Yourself?” in the Dec. 6, 1969 issue (ED 25).

I can’t possibly imagine where you get the idea that today’s young people are “idealistic.” Do you call it idealism when today’s youth smokes pot, sniffs glue, takes the needle, riots in the streets, stones the police, invades the university president’s office, runs around in sloppy, dirty clothing with sloppy-looking, dirty, long hair, and generally makes a damn fool of itself before the nation and the entire world?

I, for one do not feel I have to justify engineering to this type of person. I feel that it is not engineering that is out of step but rather today’s youth. What are needed are more old-fashioned parents like myself who establish firm rules and deliver good hard spankings when those rules are broken.

I think today’s news media—and I am including you in that group—do the nation a disservice when you describe today’s youth as idealistic. If it is “idealistic,” then its ideals are certainly completely rotten.

You say, “No wonder America’s

(continued on p. 56)
If the world’s largest machine tool company built a MINICOMPUTER, what would it look like?
THE CIP/2000 FROM CINCINNATI

A new, low cost, microprogrammable digital computer
for dedicated and general purpose applications.
The CIP/2000 operates fastest and most efficiently when specifically produced for a dedicated application. By exploiting its microprogramming capability, you can integrate it into any of your systems for control and/or data processing.

Use it to acquire data, to concentrate and/or perform computations on the data, to monitor operations and processes, to perform continuous automatic testing, to control automated production lines, for in-house time-sharing systems, for medical monitoring, or for laboratory data acquisition and experimentation control. In short, the CIP/2000 offers a low-cost, ultra-reliable method to apply computer techniques where the high costs of larger computers made such use prohibitive in the past.

For less than $3,100 you get a computer with 15 general-purpose, 8-bit file registers; 7 dedicated working registers; microprogram control; 16 powerful microinstructions, including logical arithmetic, control and literal data. Its speed is outstanding, with 1.1 microsec memory cycle time and 220 nanosec microinstruction execution time. The unit has read-only memory space up to 1,024 instructions.

Many optional features and arrangements are available, including a variety of I/O devices, core memory up to 32K, Direct Memory Access, as well as assembler and simulation software.

One application is our model CIP/2100, in which the microprogram converts the basic system into a software-programmable, general-purpose computer. Support software is available for both units, as well as strong program in training, maintenance, and field service.

The Cincinnati Milling Machine Co. has been actively engaged in the electronics field for over 15 years, manufacturing dependable control systems for real-time hostile environments. CINCINNATI controls operate sophisticated machines producing critical components for aircraft and space vehicles. The production of the new CIP/2000 computer is a natural outgrowth of this activity.

For full specifications for both the CIP/2000 and CIP/2100 computers, contact The Cincinnati Milling Machine Co., Dept. R-14, Lebanon, Ohio 45036, phone (513) 494-5444.
(continued from p. 52)

youth is ready to believe only evil about engineering.” If you read the newspapers I am sure you are aware that today’s youth believes evil about everything, including God, the church, the government, the nation, the flag, the university, the police, their parents, the judiciary, and every other established organization. Again I ask you, are all these things wrong or is it possible that youth is wrong? I think what we need to do is stop glorifying youth, give it a good boxing about the ears when needed, and nip in the bud this marvelous revolution today’s youth is promising us which will bring us to the “ideal” society.

Jack Jones
Chief Engineer
J. H. Westerbeke Corp.

Sony challenges parts of Hall Effect story

Our magneto-diode was referred to in detail in the article “The Hall Effect: Success at 90” in the ED 21, Oct. 11, 1969 issue, p. 38. We would very much like to know what sources had convinced the author that “— at about 35°C the bidirectional effect ceases and there remains only a decrease in resistance for either direction field.”

Although we admit that the present germanium device is somewhat temperature-sensitive, we firmly believe that the bidirectional behavior subsists irrespective of the temperature, as long as the electric and/or magnetic field(s) are not too high.

The effect of temperature dependence of the zero-field resistance can be compensated considerably by the use of a matched pair. Temperature dependence of the sensitivity of the matched pair can be kept within say ±5% in the temperature range 0°C – 40°C without any compensating means. Therefore, it could be, and actually is, used for analog applications where such degree of accuracy is useful.

We would also like to point out a misfitting graduation of both horizontal and vertical axes of the figure on p. 44. Each division of the horizontal and vertical axes should correspond to 0.5 k Gauss and 0.2 V, respectively, if the figure is for our product MD-230A.

Toshiyuki Yamada
Research Scientist
Sony Corp.
Yokohama, Japan

Ed.’s Note: You’re right, and we appreciate your eagle-eyed comments.

Elizabeth, I love you

Sir:

Is Elizabeth deAtley married? After reading her editorial, “Be Your Own Boss This Year—” (ED 2, Jan. 18, 1970) I think I’m in love.

On second thought she must be single. A woman who dares to suggest that technical men behave like men instead of sanitized, domesticated breadwinners is asking for rejection.

D. A. Berg
Head, Program Development
Hughes Aircraft Co.
Fullerton, Calif.

Accuracy is our policy

In the Ideas for Design item “Multivoltage Monitor Circuit Uses Only a Single Transistor” (ED 26, Dec. 20, 1969, page 81) the following corrections should be noted:

- Equation (1) should read

\[ E_{oc} = \frac{V_1}{R_1} + \frac{V_2}{R_2} + \cdots + \frac{V_n}{R_n} + \frac{V_a}{R_a} \]

- Equation (6) should read

\[ E_{oc} = \frac{K + (V_a/R_a)}{1/R_p} - V_{BE_F} \]

- Equation (9) should read

\[ \frac{1}{R_n} = \frac{K}{nV_1} + \frac{K}{nV_2} + \cdots + \frac{K}{nV_n} + \frac{1}{R_a} \]

- \( R_p \) (in Fig. 1b) should read \( R_a \)

- -12 V reference (in Fig. 2) should read -28 V.

\( V_a = -12 \) V, mentioned in the calculation example below Eq. 9, should read \( V_a = -28 \) V.

In the article “Design and Match RF Amplifiers” (ED 10, May 10, 1969, p. 106), program statement 193 of Table 1 should read IF(K) 91, 91, 161.

In the Ideas for Design item, “Temperature Stable Power Supply Uses IC As Error Amplifier” (ED 23, Nov. 8, 1969, p. 103) the lower transistor in Figure (a) was incorrectly drawn with the emitter grounded. Actually the upper and lower transistor emitters should be tied together with the lower transistor collector grounded.

The Idea for Design “Simple Crystal Oscillator Uses Monostable Integrated Circuit” featured in ELECTRONIC DESIGN page 85, December 20, 1969 has an error in the schematic. The capacitor labeled 450 pF should be marked 4 to 50 pF as per the accompanying text.
A $3.00 thumbwheel switch has started a revolution

That's our 1776. It sells for $3.00 in single quantities and if you think you can get one cheaper, you're right. Prices come down below $2.00 in quantity.

But don't let the price fool you. Our 1776 has everything you'd expect from a thumbwheel switch that costs a lot more—and then some. You can get them in an unusually wide range of codes. The widest range available anywhere. And delivered in 24 hours or less because of our nationwide sales and distribution system.

Assembly is a snap. You can mount as many as 15 stations with our snap-on retainer band. And up to 34 of them using mounting rods. They have dust seals and solder tab termination. The dial characters are large and easy to read, and they're protected against dust and moisture by a plastic window.

Join the revolution. Write for our free catalog on thumbwheel switches. That's the spirit.

one-package

MTOS
counter
display
drivers

available in production quantities
General Instrument's new one-package MTOS counter display drivers replace conventional counter decoding and driving systems requiring at least 3 packages.

It takes only one MTOS MEM 1056 in one 24 lead dual in-line package to drive a seven segment fluorescent read-out tube such as the DIGIVAC® S/G.

Conventional IC counter decoder and driving systems require at least 3 packages to do the same job.

The elimination of the need for all but this single package means lower installation costs, lower PC board costs, less assembly and test time and, of course, higher reliability.

The MEM 1056 is an MTOS monolithic integrated circuit designed primarily to operate in conjunction with a seven segment fluorescent readout tube for displaying numeric information. It contains a one decade up-down BCD counter, a storage register, a BCD-to-seven segment decoding matrix and display drivers. The device features:

- Direct Display Drive Capability
- Low Power Consumption
- Count Zero Indication
- Decimal Point Indication
- False Code Indication
- Blanking Input

The up-down counter sections of the chips can be cascaded to form synchronous counting chains. Also, by utilizing external elements, asynchronous, one-megacycle, up-down counting can be achieved irrespective of the number of counter stages cascaded.

The description and features of the MEM 1056 BCD are basically the same as those of the MEM 1056 except that the BCD version has four BCD outputs.

A new editor for Electronic Design

Major changes have been made in the editorial department of Electronic Design: Frank T. Egan, managing editor, takes over as editor from Howard Bierman, who moves to MicroWaves, another Hayden publication, and becomes publisher. Two managing editors have been appointed to fill Egan's previous post: Ralph Dobriner, formerly news chief, and Raymond D. Speer, formerly microelectronics editor.

Egan first joined Electronic Design in 1965 as a technical editor and became managing editor last May. In his new post he plans to “keep Electronic Design as responsive to the needs of designers as it has always been.”

Welcome to Japan, Mr. Bierman

Drawn by Japan's booming electronics industry and its flurry of development activity in devices and hardware—plus the lure of the mysterious Orient—Howard Bierman, then editor, traveled to the East in mid-January. Several weeks later, after more than 40 plant visits in Tokyo, Osaka, Kyoto and Yokohama, he returned, enthusiastic about the flourishing industry. Weary, too, for between business visits, he had been entertained by geisha girls, whiplashed by excited cab drivers caught in a frenzy of Tokyo traffic, and crammed full of raw fish and rice.

His report, covering Japan's dramatic market growth, recent technical developments, products to be displayed at IEEE, and an interview with a Japanese engineering manager, starts on p. U161.
The mind easer...

- You never worry about what it's doing to the circuit
- You forget about zero adjusting forever

The Digilin Type 340 Digital Multi-meter eliminates the two major causes of multimeter fretting in one low-cost, high-performance meter. First, the exclusive new Digilin Input Amplifier Technique (patent pending) does away with circuit loading throughout the test function. Forget about transient noise creeping in when impedance drops during the measurement cycle — a worry that always nags you when such input techniques as dual slope integration and chopper-stabilized amplifiers are used. The 340 never disturbs the circuit ever. And with a 340, you'll never short another lead and adjust for zero again. Before every measurement cycle, the 340 does it for you — automatically, precisely, leaving no doubt about whether it was done right.

Only with Digilin do you get these features, and the 3½-digit, 0.1%-accuracy Digilin 340 gives you lots more: Award winning design (1969 WESCON Industrial Design Competition) • Automatic polarity • Pushbutton ranging • High visibility, no-blink display • only 3 pounds • Assured reliability by Digilin 100-hour burn-in and factory test. $345 complete in single units. Need battery-powered flexibility? Digilin 341 with same features plus battery supply at $395. Digilin Type 340. The mind easer. It's an eye pleaser, too.

Get more information—or no-obligation demonstration. Call or write Digilin today. Digilin Inc., 6533 San Fernando Rd., Glendale, California 91201. Tel. 213-246-8161.

See us at Booth 3A43, IEEE Show
Now! A smaller* Digivac S/G display with important new features

NEW—Requires less space.....NEW—MIL spec construction...
NEW—Electrostatically stable.....NEW—Solderable leads optional

Electrically and optically identical to and interchangeable with the original types... but substantially smaller. Same driver and low power requirements. Rugged construction meets MIL specs for shock and vibration. Impervious to electrostatic influences. No reduction in size of the single-plane, high-legibility, 7-segment character. Eye-ease green can be filtered to provide unlimited colors. Regular 9-pin miniature basing, or 10-pins where decimal is required. Solder-in leads reduce seated height of Digivac S/G displays.

'71 budget will separate the men from the boys

Can the electronics industry meet the challenge of the priority changes in the budget for fiscal year 1971? We believe so, if it redirects its considerable resources for the national good, as well as for self-preservation.

Predictably, the first Nixon Administration budget produced an uproar of conflicting reactions in the press and in Congress. But, like it or not, the new budget reflects change, and for industries oriented to defense and aerospace, the prospect is a year of austerity. New goals for the decade are being formulated—programs to fight crime, clear the environment, and lift the underprivileged.

In addition, the Nixon approach signals a policy change: every program is subject to annual review and possible elimination or cutback—and then must await the disposition of a socially awakened Congress.

In the 50s, this nation supported without question three concurrent Air Force strategic-missile programs involving simultaneous R&D and production. In the 60s, it also financed fleet ballistic-missile projects for the Navy and carried out a successful moon landing program. All were multibillion-dollar efforts carried out in approved long-term programs.

There are no long-term national programs for defense and space in the 1970s. Strategic weapons are pawns to be played and given away in a U.S.-Soviet game called SALT (Strategic Arms Limitation Talks). The Apollo program is terminal, with death a certainty in 1974.

The impact of these priority changes will be felt by a majority in the electronics industry, over half of whose yearly sales are derived from Government contracts, directly or by subcontract. It enjoys over 40% of the defense dollar and 50% of NASA expenditures. With these markets dwindling, the industry now must adjust and seek out the far lesser portions available to it in new and expanding programs.

Electronic sensors may be adapted for use in environmental surveillance, military radio communications are needed in law enforcement, computer systems and software programs must be scaled down and put to work on medical and social applications.

This country has advanced technology, and it has the necessary designers and engineers. Now it needs to redirect those capabilities to meet new goals.

Charles D. LaFond
Get aboard IR's 40 Amp diode line. With the best track record for value.

And fast delivery.

International Rectifier's 40HF diodes have been around the circuit for some time. With its rugged case and diffused junction, this diode has become the backbone of medium power rectification. Used in a wide variety of both sophisticated and general purpose applications ranging from dc motor controls to inverter, high frequency applications. It's a top value for less dollars.

The 40HF line, forward or reverse polarity, comes in an all-metal, corrosion-resistant, hermetically sealed DO-5 case. Rated 50-1000 volts in IR numbers, 50-600 volts in JEDEC cross-referenced numbers.

And they're on-the-shelf, ready-to-deliver. At a down-to-earth price. For express-train delivery, call your local IR Authorized Industrial Distributor or IR direct.
Now . . . with CTS Cermet Multi-Turn Square Trimmers you get Characteristic C Mil-spec performance for all military applications. All new series 165 (style RJ24) and series 175 (style RJ22) meet tough Characteristic C of Mil-R-22097C. These same environmental characteristics are available . . . at lower cost . . . for commercial and industrial applications.

Both small ¼"-square series 165 and compact ½"-square series 175 trimmers assure infinite resolution over a 20 ohm to 2.5 megohm range . . . and power rating of ½ watt @ 85°C. TC± 150 ppm/°C for 2k ohms and above. —0 +175 ppm/°C from 50 ohms through 250 ohms and —0 +250 ppm/°C from 500 ohms through 1k ohm.

All available at no extra cost.

Low cost*, proven quality, and top performance—combined with fast distributor delivery—make CTS your best industrial trimmer choice.

Can’t use one of our standard series? Ask how we can solve specific application problems. Call or write for complete details to CTS of Berne, Inc., Berne, Indiana 46711. Phone (219) 589-3111.

WATT’S NEW?
A 2000 WATT LINEAR POWER AMPLIFIER FOR 10¢ A WATT!

We came through, again!
Our customers have long recognized Control Systems Research as their very best source for low cost, high performance, transistorized DC servo amplifiers. Frankly, they weren’t overly surprised when we told them about this exciting new breakthrough. They’ve come to expect this sort of thing from CSR.

But we wanted YOU to know that CSR is introducing the PFM SERIES of DC servo amplifiers for high volume servo applications like tape drives, film drives, machine tool drives, and other servo motor applications. This new generation of amplifiers utilizes a unique combination of pulse width and frequency modulation techniques to achieve a linear bipolar output — at a cost of LESS THAN 10¢ PER WATT.

The new PFM SERIES of amplifiers is available in a variety of continuous voltage and current ratings from ±60 VDC and ±40 amps on down. We review your amplifier requirements with the aid of a computer and supply an amplifier with the exact voltage and current your require.

Our OEM customers also like the fact that the PFM SERIES operates from a unipolar, non-regulated power supply and not the old-fashioned bipolar supplies. (That’s why we designed it that way.)

You might be wondering how we can get 2000 watts of continuous power out of a 3½ x 3½ x 1½ module at less than 10¢/watt — especially with internal power dissipation and the like. Call us today! We’d like to tell you all about it.

Electronic Design 6, March 15, 1970
The instrument that obsoletes systems.

Simple idea. But someone had to think of it first. We did. We took all the elements of a digital data acquisition system and designed them as plug-in modules. Then we put them all in a box—one box. Result: the system became a single instrument.

So what? Cimron's new 8000 Series Digital Data Acquisition System is the first major departure in design concept since the advent of analog-to-digital converters. This new instrument optimizes the digital system. It offers the greatest range of inputs, speed, and recording capability obtainable—all at a price no system can match. Cimron's measuring instruments will meet any accuracy and resolution requirement.

Modules in the single small 50-lb box include scanners, comparators, programmers, serializers, digital clock. No cables. No redundant components. Eliminates noisy ground loop problems. The housing contains a time shared readout, common power supply, and front panel controls. The DAS 8000 is easily expandable and computer compatible.

Cimron customer concern again brings you a new instrument for solving the most stringent and complex measurement problems at the lowest cost per channel. For details on the DAS 8000, write: Cimron, Dept. D-130, 1152 Morena, San Diego, California 92110.
check out ELECTRO'S New Low Cost MINI-PROX

Compact Proximity Sensing System for Non-contact, Detection and Control of Ferrous and Nonferrous Metals

- LOW COST
- ASSURED SENSING DISTANCE ACCURACY
- TEMPERATURE-STABLE
- NO MOVING PARTS IN ELECTRONIC OUTPUT MODEL
- PLUG-IN CONVENIENCE

MANY MONEY SAVING APPLICATIONS

- PACKAGING
- COUNTING
- SPEED CONTROL

Conveyor Control • Cut-Off Control • Missing Parts Detection • and many others

Accuracy of sensing distance is often a critical factor in sensing and control applications. Mini-Prox accuracy can be depended upon in any environment; heat to +160°F or cold to -30°F at either probe or control. Line voltage variations from 105 to 130 volts—dust—moisture—vibration, none of these affect its accuracy. You can set it and forget it.

Plug-in design provides for easy wiring. Unitized construction eliminates soldering or wiring of sensitivity controls. Connections for power, sensing head and relays are made to screw-type socket terminals. Operations up to 600 per minute may be controlled or monitored by the Model 55125 illustrated. Electronic output models for higher speeds are also available. Five standard sensing heads are presently available with sensing ranges of .050" to .250", .100" to .500", .300" to 1.000".

ELECTRO with 15 years field experience in proximity switches has designed-in reliability, assuring you of years of trouble-free performance. Compare with others of similar size and price. One look at the quality of construction tells the difference.

Model 55125 Mini-Prox with Model 41060 plug-in socket and 4943 sensing head.

ELECTRO representatives are experienced in assisting with proximity switch applications. Most carry local stocks to service your requirements immediately.

Write for bulletin giving complete specifications and the name of your nearest EPL representative.
Before you buy another 16 bit machine

STOP

General Automation has a new stand-alone computer for manufacturing automation

It's the SPC-16... a powerful new industrial automation computer... 960 nanoseconds fast... expandable 4K memory.

It's organized to provide for efficient handling of bits, bytes and words in read/write and macroprogramming in ROM... and ready-to-use GA productized software reduces programming time, effort and cost to a minimum.

SPC-16 gives you big computing power, accuracy, reliability and programming simplicity... and flexibility in interfacing with peripherals through the GA family of mini-controllers... and the SPC-16 is supported by expert consultation, systems engineering, programming and customer training services.

So before you buy another 16-bit machine... ask about the SPC-16 performance... Cost? Less than $10,000.

Ask about other industrial computers in the GA family. The SPC-12 for less than $5000. System 18/30 for under $20,000.

Is the 901 counter-timer just too good to be true?

NO!

It was...but it's not any more!

Last year, when we introduced the Model 901, we were years ahead of the industry. Here was the first state-of-the-art universal counter-timer that could count directly to 200 MHz without a plug-in, and—with a plug-in—could go right on counting into the gigahertz range. What's more we offered it at the unheard of low price of only $2475—about $250 to $1000 below the nearest competition!

It wasn't long before we knew we had a tiger by the tail. Here was a dream instrument with all the universal counting and measuring functions built into the standard main frame...with gate times of 1 µs to 100 sec instead of to just 10 sec...with a TIM with a resolution of 10 nsec instead of 100...with an input sensitivity of 10 mV instead of the usual 50 or 100...with 9-decade readout instead of just 8...and with remote control available as an optional extra. With all that going for us we had just one problem: how to get into volume production fast enough to meet demand.

Now cut to 1970. The industry still hasn't caught up with the Model 901, but our production has caught up with demand. You can now buy this state-of-the-art instrument right off the shelf for the same low price. What's more, for only $825 extra, you can also have the Model 931 Heterodyne Converter plug-in that extends the 901 frequency range up to 1.3 GHz.

But why dream on? Why wait to catch up to the times? The 901 is a reality today. For the full facts, circle the reader service card.

It's the second bus that separates the men from the boys in the new systems computers

The GRI-909 Direct Function Processor — leader of a new breed of powerful, systems-oriented mini-computers — is characterized by a dual, internal/external bus system. No other computer offers such a dual bus approach. Therefore... no other computer can provide all these features:

- 16-bit word device-to-device transfers in a single cycle
- 16-bit word register-to-register transfers, both internal and external to the computer
- "On-the-fly" arithmetic operations during transfer
- Unlimited priority interrupt channels
- Unlimited direct memory access channels.

Check out these and the many other exclusive GRI-909 advantages. You'll find that nothing on the market today can touch it.

Write for the new GRI-909 brochure.

the 2-Second Cathode

ITT's fast warm-up electron gun.

For its broad line of traveling wave tubes, ITT Electron Tube Division has developed a cathode with the fastest warm-up interval in the industry.

For any TWT that we make, you may now specify this cathode. You'll receive a tube that accommodates all your performance requirements in addition to reaching full power output temperature in TWO SECONDS.

Putting you in a unique position is putting us in a unique position. ITT Electron Tube Division, International Telephone and Telegraph Corporation, P.O. Box 100, Easton, Pa. 18042.

ELECTRON TUBE DIVISION ITT
The MC1170L – Fastest MOS Memory Available

High performance and low cost neatly sum up the characteristics of Motorola’s MC1170L 64-Bit MOS Random Access Memory. Designed for use in 500 ns or less access time systems, the memory is organized as 16 words of 4 bits each and features a typical access time of 250 ns. Decoding, Read, Write and Storage circuitry are all contained on the 80-mil square chip, thereby minimizing interconnection requirements and fabrication costs. And when cost is a prime consideration the MC1170’s production quantity low bit cost overshadows higher 50¢/bit costs for 16-bit bipolar memories and 25-to 50¢/bit costs for magnetic memories (4,000-bit systems).

A word in the memory is addressed by applying the appropriate binary code to the four address lines. Separate read and write inputs control the mode of operation. During operation, four bit lines insert data into the memory in the write mode and sense the stored information in the read mode.

The MC1170L is flexible for expansion to larger memory systems. The binary addressing characteristic, the bit line wired OR capability and the availability of the enable input all aid in expanding the MC1170L to meet larger system requirements.

Use the MC1170L anywhere that low speeds and low data rates are required. Since the readout is nondestructive the MC1170L offers advantages over magnetostrictive delay lines. And, its comparative low-cost/high performance/small-size ratio suggests applications in digital instrumentation, miniaturized data processing equipment and advanced office machines.

Now’s the time to start thinking of your system. To help you out we have a new application note (AN-501) which explains the MC-1170L in detail. It’s yours for the asking — just write to P.O. Box 20912, Phoenix, Arizona 85036. And for immediate evaluation units call your local Motorola distributor. Make this a day you’ll remember with fond memories.

Treat Your System To A Fond Memory...
Relamping is simple with Chicago Miniature's CM-25 "Brite-Lites." No tools are required. You merely unsnap the cap and remove the unbased T-1 lamp with your fingers. Our engineers devised an ingenious way to simplify lamp insertion, too. The new lamp easily inserts into internal wire lead guides. The lead guides are indented (patent pending) to assure positive contact with the lamp leads. There's no need for lead soldering. Relamping is all done from the front of the panel, so base removal is unnecessary.

Here's another engineering exclusive close plus and minus tolerances.

Holding light tolerances improves parts interchangeability and panel appearance. Also, "Brite-Lites" are available with cylindrical caps that can be easily hot stamped with legend information. These "Brite-Lites" mount on .250" centers and have a strong polycarbonate base with leads for panel or printed circuit wiring. You can specify any of six different cap colors in translucent or transparent types. Our Lited Devices catalog CAM-2 gives details on our complete line of quality indicator lamps, just circle the reader service number to receive your copy. Write on your company letterhead to receive a sample "Brite-Lite" so you can dissect one yourself.

For application assistance contact your Chicago Miniature Sales Representative. For off-the-shelf delivery, contact your local authorized Chicago Miniature Electronic Distributor.

THE LIGHTING BUGS

How to disect a lighting bug.
Nowadays, most "miniature" RFI filters just aren't miniature enough. Ours are. In A C or D C, these new Mini-Filters are at least 20% smaller in volume than the ones you're using. Now that's miniature.

As for insertion loss, how does 5 to 10 more Db's sound? That's how much more these little giants suppress, despite their smaller size. And, they do it with an even lower DC resistance.

Something else. They're priced a little smaller. That's a big plus.

So quit cramping your style. Go from small filters to Mini-Filter's. They're 100% ready for delivery. Right now.

Make the big move.

Depend on RCA reliability in complementary medium-power transistor pairs...

hermetically sealed for broader applications.

Now...RCA covers the industrial spectrum with general-purpose, p-n-p/n-p-n transistor complements...and they're all hermetically sealed in TO-5 packaging to give you greater design flexibility and reliability. Choose any of these broad-spectrum device families—the p-n-p 2N5781, 2N5782, 2N5783, or the n-p-n 2N5784, 2N5785 and 2N5786. They can fit a host of switching and amplifier applications—in computers, for example, as well as in oscilloscopes, radar, missiles, hi-fi equipment, marine radios and satellite communications systems. RCA silicon p-n-p and n-p-n medium-power transistors all feature low saturation voltages, high breakdown voltages and high $h_{fe}$ (min.) at high current. And they're beta controlled to 1.6 A, with collector-to-emitter sustaining voltages ($V_{cER}$) up to 80 V available. $V_{ce}$ (sat.) is 1.0 V max. at 1.6 A. For complete details, see your local RCA representative or your RCA distributor, or write RCA Electronic Components, Commercial Engineering, Section IG3-2/UT5, Harrison, N.J. 07029. In Europe: RCA International Marketing S.A., 2-4 rue du Lièvre, 1227 Geneva, Switzerland.
Even in power supplies, somebody makes progress once in a while. This is the new NIMS high voltage power supply.

It’s a Fluke.

Fluke’s new NIMS (nuclear instrument module system) high voltage power supply is priced about the same as the three major competitors, $460. That’s where the similarity ends. In every other pertinent spec, the new Fluke 423A exceeds or at the very least meets the competition. And, in addition, it offers some exclusive features all its own. Let’s go down the list. Only Fluke offers a full 0 to 3000 volts, line and load regulation of 0.001 and 0.002 percent across the board. Only Fluke offers portable bench case or NIMS bin module. Only Fluke offers remote analog slewing of the output or manual operation. Only Fluke offers a current limit of 15 ma. Other specifications are output current, 0 to 10 ma, Resolution, 100 mv. Accuracy, 0.25%. Ripple and noise, 5 mv peak-to-peak (10 Hz to 1 Mhz). Polarity is reversible at the rear panel. Size is 2.7” x 8.7” x 9.7”. Price with case is $495.

For full details, see your Fluke sales engineers or contact us directly.

Brand New - The NLS Series MX-2 Multimeter

This is a PEACH of a buy. The MX-2 combines multifunction capability with the integrating technique of A/D conversion in a low-cost, versatile, accurate unit with stability unequaled in low-cost digital meters. And you receive all of this without sacrificing the quality feature of plug-in construction. The MX-2 affords 5 DC Ranges, 4 AC Ranges, 5 Ohms Ranges, Auto Ranging and Polarity and Printout, all at a price so low you'll want to buy a PEAR of them. Send for our brochure which graphically compares the MX-2 to other low-cost 4-digit Multimeters in a factual, easy-to-understand manner. Non-Linear Systems, Inc., P.O. Box N, Del Mar, Calif. 92014, 714/755-1134, TWX 910/322-1132.

Making speed/cost trade-offs in conversion equipment?

With Raytheon Computer, you can have it both ways.

Analog/digital interfaces and conversion can end up costing you more than any other portion of your system.

So we’ve come up with a system of our own. Instant conversion in a range of prices and performance levels. All with the best price/performance ratio in the industry.

For analog-to-digital conversion, $1,220 buys you our 10-bit A-to-D converter and a 50kHz word rate. $1,790 buys our 12-bit high-speed 100kHz Miniverter™. $4,095 gets our 100kHz, 15-bit Multiverter® III. Each of these analog-to-digital converters has 8 multiplexed channels (expandable to 128) and a short-cycle control for even higher through-puts with shorter words.

And every converter is fully-wired, fully-tested and fully documented with wiring lists, test results and technical manuals. You get a complete instrument, not just a collection of cards.

The same story holds for our other conversion and interface equipment. DAC’s. Multiplexers. Sample-and-holds.

Or even complete computerized systems. We have a family of 16-bit computers that let you make your trade-offs working with a choice of CPU’s that range in cycle times from 900ns to 1.75µs and in price from under $10,000 to $19,000. And we’ll get you on-line faster than anyone else because we have over 400 de-bugged proven programs available off-the-shelf.

Like we said, we’ll give you the best price/performance ratio in the industry. If that’s what your systems need, call or write today. Ask for Data File CB-180.

The only thing Raytheon Computer does is your job. Better.
If you don't see what you want here just ask.

Room for improvement

General Electric's TO-5\(^2\) transistor-size sealed relays give you more room for increased power, improved performance.

We didn't cut any corners on this high-reliability, transistor-size sealed relay. We left them on so there'd be more room for a more powerful magnet—2½ times more powerful.

This added power means this type 3S8S, 2PDT, 1 amp relay gives you higher contact forces, larger contact gaps, and greater overtravel to minimize mechanical shifts. Shifts which usually increase early-in-life failures.

Though there's more room inside to give you all these advantages, the outside dimensions—top-to-bottom (.275") and side-to-side (.370")—are the same as any transistor-size relay.

So don't cut corners on your next transistor-size relay application. Specify GE's square Type 3SBS. For full details, write General Electric, Section 792-45, Schenectady, New York 12305.
NCR, Los Angeles, is the largest, fastest-moving commercial computer manufacturing facility in Southern California and one of the most advanced in the world. Here, you can share new fourth-generation challenges with men who have already placed some of the world's most advanced digital systems hardware and software on the market.

MAGNETIC HEAD DESIGN ENGINEERS
To design and develop flying magnetic recording heads and the required prototype tooling. Positions require BS or MS in EE, ME or physics plus three years of applicable experience. Knowledge of ferrite machining technology and ferrite heads desirable.

ADVANCED DEVELOPMENT ENGINEERS
Positions available for senior MECHANICAL and ELECTRONIC engineers with strong experience in high-speed mechanisms and mechanical, hydraulic and electromechanical systems.

LOGIC DESIGN ENGINEERS
Senior-level positions in logic design for persons with knowledge in MSI and LSI circuitry for fourth-generation computer systems. Also positions in manufacturing engineering for digital test equipment design. Positions require BSME/BSEE and five years' related experience.

CIRCUIT DESIGN ENGINEERS
For design and development of LSI circuitry arrays, including detailed circuit design and extending through integrated fabrication. Will also evaluate LSI packaging concepts and interface with semiconductor vendors. Prefer BSEE and several years of related experience.

BROAD-HORIZON, PRESENT-TENSE, NON-DEFENSE, NON-STOP ENGINEERING AND PROGRAMMING OPPORTUNITIES AT NCR, SOUTHERN CALIFORNIA

SOFTWARE PROGRAMMERS
To design, code, de-bug and document operating systems software or on-line executive software modules. Prefer degree in business or a science discipline and/or experience in systems programming.

DIAGNOSTIC PROGRAMMERS
Positions involve the writing of diagnostic programs for checkout, acceptance test, file maintenance of EDP systems. Requires previous programming experience.

NOW INTERVIEWING
Positions are open at NCR Los Angeles and San Diego facilities. To schedule an interview during the IEEE International Convention in New York City, March 21-24, contact Steve Williams at the New York Hilton Hotel or send resume, including salary history, to the address below.
YOU CAN'T KEEP A GOOD BUTTERFLY DOWN.

Many years ago, before cyclamates or even The Pill, the little Licon people tried to invent a completely new kind of switch. It was to be a double-break switch no bigger than a single-break. Oh boy.

But seriously, this meant a lot to them. They wanted a switch with a life expectancy of over 20 million mechanical cycles without alteration of original switch characteristics. Two transfer blades instead of one. And twice as many contact surfaces. Generally speaking, that's double the electrical rating of a single-break switch of equal size. (If you're impressed by this, read on. If not, read on anyway, there's only a little left.)

As the months passed, the Licon people worked on. And off. Until it finally happened—the Butterfly action double-break switch was born. Hallelujah! Yippee! Hurrah! Etc.!

Since it did everything it was supposed to, and according to the custom of the land, those smart little people had it patented. And in no time the Butterfly became a giant among switches. It sort of took off on its own.

To this very day, the Licon people continue to produce the fabulous Butterfly switch. In sizes from subminiature to heavy duty. So, when your children ask you where the Butterfly switch comes from, you can tell them this story. Then again, you might be better off telling them you don't know.

Better yet, tell them to write for a catalog.

CIRCLE NO. 65
A new show helps launch ‘The Spectacular 70s’

A new decade...new hopes for the most revolutionary industry in America—electronics. The IEEE International Convention and Exhibition has its sights on target: "Launching the Spectacular 70s in Electrical and Electronics Engineering" is its theme this year. And the emphasis is again on peaceful uses of electronics, only more so—computer techniques in urban government, community antenna television, air and ground traffic control, medical aids for the handicapped, and air and water pollution control.

There are more technical sessions this year—62 in all. Seven are special "how-to-do-it" sessions, dealing with the techniques that experts in the field are using to solve everyday design problems.

In addition, for engineers interested in expanding their education, tutorial seminars are being held on computers and patient care, programming for industrial-process computers, digital filter design and application, the use of quantum electronics today, monolithic integrated circuits, LSI.

More than 60,000 engineers are expected to attend the show March 23-26. Over 600 companies are displaying products in the four-story Coliseum in midtown New York. The exhibitors include representatives of Japan’s booming electronics industry. The new Japanese emphasis is on quality—and the products show it.

But before you join the bustling traffic in the aisles, relax. Take the short tour with ELECTRONIC DESIGN—here, right in these pages. You’ll get a fast, authoritative look at the highlights without footsore fatigue. The tour starts below:

Technology: Present and future
IEEE convention papers tackle the problems and promises of electronic designing and application

Circuits
Gigabit technology picking up speed

Speed and packaging-density improvements are helping gigabit digital circuits toward wider acceptance among design engineers. Increased speed, in particular, is welcomed by users. It allows real-time processing of very-high frequency signals, important to military applications. And in price-sensitive situations, such as large computer facilities, high speed cuts the cost of each computation.

These and other developments in gigabit digital circuits are discussed in Session 5C. The session chairman, Wayne Cotten, an electronic engineer with the National Security Agency in Fort Meade, Md., explains that gigabit digital circuits are finding major applications in two categories: high-speed signal processing and large-capacity computers. He has selected several technical presentations to demonstrate the circuit advantages over what he terms “mainstream technology.”

Cooling trade-off analyzed

Examining digital-circuit packaging and layout, with emphasis on thermal considerations, William Rhoades, senior staff engineer with Hughes Aircraft, Fullerton, Calif., says cooling in high-density circuits calls for a trade-off with speed. Efficient cooling requires considerable physical space, thus increasing the circuit dimensions and slowing performance. On the other hand, fast circuitry dissipates the most heat per unit area and thereby needs a superior cooling system to operate reliably. Rhoades concludes in a paper, “Packaging Aspects of Gigabit Digital Circuits,” that with continuing demands for increased digital circuit speed, packaging design will become the chief limiting factor.

Efficient cooling capable of dissipating greater than 20 W per square inch is now possible, he says. His design utilizes a closed system where liquid coolant is first vaporized and then permitted to condense while dissipating heat. The system is maintenance-free, using no pumps or moving parts.

A breakthrough in measuring

From Yohan Cho, president, and John Connolly, vice president, of Tau-Tron, Lowell, Mass., comes a breakthrough in rapid MSI and LSI measurements. Their talk, “Ultra High-Speed Digital Array Testing,” outlines a new computer-controlled method that allows exhaustive tests of a 100-pin integrated circuit in a few microseconds. Cho says that other schemes using computers for digital-circuit testing have a built-in delay, because the control and pattern-generation functions are combined. By providing separation of computer control and pattern generation, Cho reports his system accomplishes in microseconds what other equipment needs weeks to perform.

Emery Garth, a member of the technical staff at Texas Instruments, presents interconnection and packaging methods for obtaining high-gate density. Garth has developed packaging advances that allow gate densities that are five times greater than competitive processes. Excellent power dissipation is maintained throughout the improved circuitry.

In his paper, “Interconnection of ECL Circuits for Maximum Gate Density,” Garth includes computer-aided design techniques for building high-speed systems. Beginning with a logic design input, the computer-aided capability described by Garth is said to produce art work for the construction of printed-circuit boards. Cost and time savings are realized by eliminating drafting.

Tips on getting fast switching

Feedback current switching circuits, utilizing low threshold voltages to obtain fast switching,
Peering into his upconverter is A. H. Firester of RCA, Princeton, N.J. The device is used to convert infrared images to visible images. The red streak is an infrared laser beam (Session 1A).

Communications

A new era beckons systems developers

The communications emphasis at this year's IEEE show is definitely on systems concepts—the major trends that are expected to dominate the communications field for the next decade—not on neat solutions to specific little problems. The problems and the future of satellites, cable, waveguide, laser beams and terrestrial radio are treated at separate sessions.

Also being given close scrutiny is the union of the computer and communications. On the one hand, the communication system is a tool that provides a data link between two or more computers. On the other, the computer is a component in a communications system, where it may perform functions as diverse as signal processing and message or circuit switching.
A third, increasingly important, area being covered is electromagnetic compatibility (EMC). The current art and future needs—both military and commercial—are being discussed.

The satellite story

It’s estimated that at its present rate of growth, the volume of mail handled by the U.S. Post Office will be so large by the end of this decade that the nation’s labor force will be unable to distribute it if today’s methods are employed. Problems like this are stimulating great interest in broadband transmission systems, being covered in Sessions 1B, 2B and 3B.

Session 1B, “Satellite Communications for the 70s,” will attempt to project current technology over the next 10 years. The technology is expected to have two major effects: It will change the nature of existing services, and it will make new services possible. Existing services, which consist almost exclusively of international telephone communications, will be called upon to handle increasing amounts of data and other traffic, such as TV and telemail. Also, time-division, multiple-access schemes will begin to replace frequency-division, making possible very flexible demand assignment methods of operation. Spot-beam antennas will further improve the flexibility and capacity of future satellite systems.

Among the new services that will become available will be direct broadcast—from a satellite to, say, a home TV receiver—and data relay.

All of these developments are technologically feasible and may become operational in the next decade. Whether they are actually implemented or not will depend upon a variety of technical and economic tradeoffs, the discussion of which should make Session 1B an important one for systems planners, Government officials and communications systems designers.

The ‘wired city’ concept

Just as satellites can solve a wide variety of long-distance communications problems, cable systems can deal effectively with the perhaps more challenging short-haul cases. Session 2B, “A Broadband Communications Network of the Next Decade—Cable Television,” describes what can be done with cables and examines the tradeoffs involved in using cables to provide services that are now supplied by other means.

The “wired city” concept envisions use of a single broadband cable for all of a subscriber's communications needs in the nation’s urban areas. Hundreds of educational and instructional TV channels would be available simultaneously over such a system, in addition to regular off-the-air TV, electronic mail delivery, data transmission, and other broadband services. Furthermore, there's no reason why a cable-equipped home or office couldn't use its cable for information retrieval, thus effectively putting an entire library at the user's fingertips.

Satellite systems designers may be particularly interested in a paper by Q. B. McClannan and G. P. Herkert of Philco-Ford Corp., Palo Alto, Calif. Entitled “Use of Satellites for CATV,” it examines the rather unusual tradeoffs that come up when a satellite is used to feed a group of CATV networks. Existing satellite systems involve only a small number of earth stations, and so the system designers have been freed to specify fairly expensive and sophisticated ground equipment (85-foot antennas, cryogenically cooled receivers, etc.) to make the satellite as simple and reliable as possible. Direct-broadcast satellites go to the opposite extreme; they involve millions of receivers, and hence must keep receiver cost down, even at the expense of tremendously powerful satellites. The CATV case falls in between, and it should be interesting to see how the tradeoffs work out for that application.

Session 3B, “Millimeter Wave and Optical Systems: Superhighways for Telecommunications,” describes not only the capabilities of these systems but the manufacturing and installation problems as well. Since the millimeter-wave transmission art has advanced farther than the
optical, it gets most of the detailed attention. Only one paper out of the four—"Optical Transmission Research," by R. Kompfner of Bell Telephone Laboratories, Holmdel, N.J.—deals with optical systems. The paper describes the three approaches to optical transmission that are currently receiving the most attention, mentions their huge potential capacity and compares the present state of their development with that of millimeter-wave systems.

"The Digital Mating Call of Computers and Communications" (Session 6B) is a panel session that aims to focus on the problems that need solving in this area over the next five years. The panelists include representatives of the users of computer communications, suppliers of communications services and the Government.

The use of computers to process analog signals is covered in Session 4B, "Digital Processing of Analog Signals." Two papers are devoted to digital filtering.

The compatibility problem

Electromagnetic compatibility has been growing steadily in importance as the spectrum has become more crowded and electronic systems more complex. Session 4D, "Progress in the Electromagnetic Compatibility Field," is not aimed especially at communications systems designers, but it offers them so much that it cannot be passed up. Some papers describe what needs to be done in EMC in the future, and others suggest the methods for doing it.

A particularly valuable paper on methodology is "Intrasystems Compatibility in Large Aerospace Systems," by Jim Spagon of TRW Systems, Redondo Beach, Calif. It presents a philosophy of design that will probably become universal in the future: the systematic consideration of EMC problems at the beginning of any complex design project.

With this approach, the system is first modeled with such available data as pulse rise times, power levels, receptor susceptibility and the like. Then a computer program is employed to determine the subsystem specification limits that will give the whole system a comfortable operating margin, without over-designing everything. The computer can also help in the selection of critical test points and in the design of cabling.

This approach is not pie in the sky, Spagon points out. It works. The computer program was used during the Apollo program to study potential EMC problems between the lunar module and the command service module in their docked configuration. With the computer-aided approach, NASA saved quite a bit of time and money.

The problems, both legal and technical, of "electromagnetic pollution" are also covered in Session 4D. Herman Garlan of the Federal Communications Commission is presenting a paper on "Recent Legislation and Future Requirements of the FCC and Industry in EMC." It offers designers a chance to sample the Government's thinking in this area.

Computers

'Cities are the growth industry of the future'

"There are opportunities for engineers in urban government."

So says Dr. E. S. Savas, New York City's First Deputy Administrator who is chairman of Session 1C, "Computer Techniques in Urban Management." This session and 7F, "Trends in Computer Applications for the 70s," deal with some of the social problems facing this country—problems that are opening up new challenges for engineers.

The emphasis of Session 1C, according to Dr. Savas, "is to lay the groundwork for future, more glamorous applications." He says: "Lots of fundamental good stuff has to be done to avoid getting into technological disasters as we reach for more complex systems. It is mandatory that significant upgrading and modernization take place in the cities. Cities are the growth industry of the future."

Richard Golden, Acting Director of Data Processing for the city of Chicago, is presenting "The Chicago Story," a discussion of how Chicago is making use of computers and electronic data processing. This presentation and one by Harry Lipton, Manager of Computer System Planning in the Office of the Mayor, New York City, describe the use of computers and data communications in police and fire departments.

Dispatching problems involved

Automated communication and dispatching are vital to police and fire services. A problem of particular interest arises in Fire Departments in large cities. When a fire company answers an alarm, it leaves behind an empty firehouse. If no plans are made for redeployment of other companies, its local area is unprotected. A scheme must be established to assign priorities to other companies to cover for those that are answering alarms. A computer-controlled program for performing this function can provide more efficient coverage and greater protection.

It is problems like these, which are solved
Digital display + exact comparison
...a new team from API

API now teams award-winning digital panel meters with matching digital comparators to bring you large up front display and precise limit control, plus the other quality features you expect in fine digital instruments.

**Digital panel meter**

Model 4304—Range: 0-199.9 mV to 0-1000 V. Price $245.

*Standard features:* • autopolarity • 0.1% accuracy • BCD output • dual slope integration • selectable decimal points • separable power supply

**Digital comparator**

*Standard features:* • BCD input 1-2-4-8 • algebraic comparison • logic output • 2 amp relay contact • visual lamp indicator • adjustable thumbwheel limit • fixed limit • remote programming

For the full story on what's new in digital instrumentation, ask for *API Digital Products Data.*

**INFORMATION RETRIEVAL NUMBER 66**
readily by an engineering approach, that may attract engineers to urban government. Both Golden and Lipton hope to develop interest among their listeners for such service.

The minicomputer dissected

"The Minicomputer Phenomenon" is the title of Session 5G, with L. C. Hobbs of Hobbs Associates, Inc., Corona del Mar, Calif., the organizer and chairman. The minicomputer is a small computer with a very small price tag. The availability of main frames with 8-to-16-bit words and 4k and up words of memory can do a wide variety of jobs that is not being done well or at all at present. Among the problems encountered in applying minicomputers, however, is that of interface with other equipment.

In a paper entitled "Peripheral Equipments for Minicomputers," Larry W. Vincent of Lockheed Electronics Corp., Los Angeles, discusses the problems of input-output interface standards, the place of the minicomputer in data terminals of larger systems, its role as a black box in control systems and the rapid loading of programs.

The organization of the internal structure of a computer determines how well it operates in a given environment. This internal structure is designed into the machine by its manufacturer. And in "Systems Architecture for Minicomputers," by G. C. Hendrie of Honeywell, Inc., Framingham, Mass., the internal structure of various minicomputers is contrasted with input-output and peripheral connection and addressing schemes, particularly for machines with short word lengths. Hendrie also discusses methods for dynamic relocation of programs and the protection of memory, both of which are important when multi-programming techniques are used.

Panel discussions planned

Several topics of interest to computer-oriented engineers are the subjects of panel discussions. Session 6G, "Prospects for Time Sharing in the 70s," probes an industry that is now undergoing serious stresses resulting from a cost squeeze. The topics to be placed before the panelists include software applications, language services, interaction with large data structures and the handling of remote batch processing. In addition development of remote terminals and standards for interactive terminals will be considered. T. D. Truitt of Prime Information, Inc., Princeton, N.J., is the organizer and chairman of this session, and the panelists represent time-sharing services and their users.

Session 4R addresses itself to "System Engineering—How Can We Use It Effectively?" The panel moderator is Dr. Robert A. Frosch, Assistant Secretary of the Navy for Research and Development, who has gone on record as a critic of the way in which systems engineering is being applied. He has written that systems management techniques are no substitute for good management practices and that a mystique has grown up around the systems approach that credits it with more than it can deliver.

Joining Frosch as members of the panel are Dr. Eugene Fubini, a consultant of New Canaan, Conn.; Harold Chestnut of General Electric Co., Schenectady, N. Y.; R. E. Donohue, an R&E specialist with the Dept. of Defense, and J. A. Baird of Bell Telephone Laboratories, Holmdel, N.J.

Many significant questions are being addressed to the panel. Among them: "Why are we faced with accelerating costs and system inadequacies in transportation, communication, weapons, education, health services and other areas while our environment has become increasingly more polluted?" The panel will try to answer the over-all question by considering more specific areas, such as: When should systems engineering be used? How should the computer be used? What can be done to improve existing systems? Is military
systems experience transferable to civilian systems? This discussion could be a highlight of the convention.

Medical

Designers still grope for efficient ‘limbs’

Microminiaturization, hydraulic logic systems, portable computers, microminiature electrodes—all aspects of control systems and electronics technology have been brought together. But designers still haven’t satisfactorily solved the problem of how an artificial arm and hand are to pick up a glass of water.

This is the theme of Session 2D: “Augmentation for the Severely Handicapped—Mental, Sensory, and Motor.” Leon Harmon of Bell Telephone Laboratories, Murray Hill, N.J., chairman and organizer of this session, points out that even the simplest things that people do, think or perceive involve a highly complicated natural system.

The trend in this area, so far as electronics is concerned, lies not in techniques but more in the development of design systems, such as pattern recognition and computer control.

‘Understanding the relationship’

The solution to aiding the severely handicapped, says Harmon, “lies in understanding the relationship between physiology and psychology.” He gives this example:

“From the fingertip to the shoulder, there is something of the order of 40 to 50 degrees of freedom. The best artificial limb systems so far have only two or three degrees of freedom.”

Harmon says an artificial-limb system—articulated in every joint, with each joint able to rotate—could be built but for these reasons:

■ Failure to produce electromechanical devices that are both small enough and able to operate with the same degree of precision as a natural system.

■ Lack of insight into how to go about making the multiple-control signal network required to drive as many as 30 different signals simultaneously and in coordination.

The best that has been done so far, Harmon says, is to implant tiny electrodes in muscle stumps, so that when a person thinks about moving, a detector can pick up a signal from the brain to whatever residue of muscle is left. Such myoelectric pickups in residual muscles can operate a prosthesis.

However, Harmon cautions, “the complexity of coordinating such signals is so great that only two or three such signals—or four at most—can be processed simultaneously. The result is a very crude approximation of the real thing.”

Artificial elbow developed

An important recent advance in motor prosthesis is an artificial elbow developed by R. W. Mann at the Massachusetts Institute of Technology. Mann uses myoelectric detectors in residual muscles to pick up not only information from the efferent nervous network that transmits from the brain to the limb, but also information from the afferent system that feeds information back to the brain. This feedback indicates to an amputee the position of his elbow without his looking at it.

“Our aim,” says Mann, “was to take full advantage of the natural workings of the brain, spinal cord and nervous system, and electronically process information from these sources, to drive the elbow.”

To create a skin sensation that moves up and down the muscle stump, Mann places potentiometers in the elbow that drive vibro-stimulators. There are 36 operational amplifiers on two printed-circuit boards in the elbow. This could be boiled down to a couple of tiny silicon wafers, Mann says.

More than 20 such elbows are now being fitted at clinics in the field. But the eventual use of this prosthesis will depend not only on how efficiently it works but also on how well it will be accepted by the independent physician in a field that Mann characterizes as “relatively static.”

Harmon agrees that the use of electronics to aid the handicapped is “embryonic in its development,” but he adds: “It’s developing fast.”

Help for mentally deficient

To help the mentally deficient, there are computer systems that enable training to go on repetitively, according to Harmon. But he emphasizes that “people are sometimes deficient in particular ways.” For example, it has been found that sometimes a person regarded as mentally deficient because he can’t speak or write has been able to typewrite. Harmon compares the opening of communication channels for the mentally deficient with finding substitute “seeing” channels for persons who are blind.

A major point made by Haig Kafafian of the Cybernetics Research Institute in Washington, D.C., is the interrelation of sensory and mental deficiencies. “If a person is blind,” says Harmon, “he’s already got a mental deficiency of a sort,
Electronic elbow was developed by a group headed by Prof. Robert W. Mann of MIT. The pivot point (elbow) is because that avenue of communication is cut off."

It is difficult to consider any deficiency in isolation, Harmon says. The job of the engineer is to tailor a communication channel to the needs of a particular deficiency.

**Microcircuits**

**IC complexity due to double yearly**

Over 12,000 bits of read-only memory on a tiny piece of silicon—that's going to be easy, say industry experts, in the MOS world of 1973. And by that time bipolar random-access chips should reach at least 4096-bit complexity.

Chip complexity in memory and logic circuits is expected to double every year for at least the next five years. The result will be lower costs per function—well under a penny a bit—and the new, fast silicon memories will compete aggressively with core over the next decade.

For designers in the computer industry, the implications are clear: Study the new technology, know its capability and be prepared to use it. And Session 4A, a panel titled "Integrated Silicon Devices—A Projection Through the 70s," offers a chance to learn. The session organizer, Jack Raper, manager of advanced circuits at General Electric, Syracuse, N.Y., has assembled speakers who are known throughout the world for their expertise in semiconductors.

The panelists include Dr. Robert Noyce, president of Intel Corp., Mountain View, Calif; Jack Kilby, assistant vice president, Texas Instruments, Dallas; Eugene Blanchette, group director of integrated circuits, Fairchild Semiconductor, Mountain View, Calif., and W. S. Boyle, executive director, Semiconductor Components Div., Bell Telephone Laboratories, Murray Hill, N.J.

**A look at the future**

Attending designers are being treated to a fascinating glimpse of the semiconductor world of the future. While the achievement of 12,000 bits per chip in MOS read-only memories is regarded as a certainty, for instance, bipolar random-access memories will run into serious heat-dissipation problems at about 512 bits per chip.

As Robert Graham, director of marketing of Intel Corp., points out, bipolar read-write memories dissipate at least 2 mW per bit. The 512-bit chip has roughly 1 watt of dissipation, and that's about all you can handle in a regular package. For higher complexity and higher dissipations, the manufacturers will have to go to expensive studded packages that can be attached to suitable heat sinks.

Package cost is going to be important, even for low-dissipation chips, because chip costs are going to drop swiftly, and package costs aren't. Graham sees bipolar memory challenging MOS memory in price in the next few years, and package cost will help this occur. As both bipolar and MOS chips get cheaper, the cost of the packages they're mounted in becomes more important, and
the costs of packaged units will tend to equalize. There are a few rocks in the road ahead, too. Graham sees two problems: “First, we are reaching the limits of optical resolution in our photolithography. Ultimately the wavelength of the light passing through the optics will limit process accuracy, and we'll reach a plateau of achievement by 1975 or so. Second, design and tooling costs are becoming prohibitive in complex chips. We must use computer aids to keep the cost down.”

The Intel executive says that the design of the logic function is easily done now with computer aids, but problems remain with chip-layout design. It costs so much and takes so long to do chip layouts that the progress of complex semiconductor products is being held up. Graham sees a partial solution in replacing random logic designs with read-only memory, though. ROMs are much easier to design and test.

There are problems, too, in deciding on useful products. Texas Instruments' Kilby notes that the industry's ability to build complex IC products has outreached its ability to design catalog items of that complexity. “That's why linear IC sales are so small,” he says. “We haven't been able to identify suitable building blocks.”

Rise in custom work possible

Production of standard lines of building blocks greatly simplifies the vendors manufacturing operation and the presentation of products to customers. The sales engineer can tuck a catalog under his arm and hit the road. But Kilby sees a possibility of heavily increased custom design work.

The vendors may have to compete with one another for design contracts on each piece of customer equipment—and the emphasis on fast, accurate design will lead to intensive use of computer aids. Sales forces in this case will have to work very closely with the customers' engineering groups. An example of this trend to custom work is the MOS field. “We're doing a large number of custom design programs already,” Kilby says.

He warns that the designer of the future, the expert in application of IC products, will have to spend a lot of time studying the function of his designs on a system basis. He'll be forced to relinquish much of his detailed design work—that will be done, in effect, by the designers of the ICs.

The critical compatibility issue

One of the most critical system questions facing designers today, of course, is the compatibility of MOS and bipolar circuits.

Making MOS and bipolar circuits work together is getting easier, but it's still a tricky task. Designers faced with the problem must attend Session 3A, “Achieving MOS-Bipolar Compatibility.” Speakers from Bell Telephone Laboratories, MOSTEK, Union Carbide, Motorola and General Electric are examining the problems, reviewing the methods and spelling out the future of interfacing.

For the designer new to the MOS world, the problems are many. He must know, for instance, when to press for custom MOS design, and when to use off-the-shelf MOS and bipolar circuits to build a system.

And it's really a tough problem in economics. Wally Raisanen, manager of MOS and memory products at Motorola Semiconductor, who presents a paper on Motorola's 8000-bit MOS-bipolar LSI memory, points out that there are no uniform cost figures in custom design and that estimates vary widely, depending on design details. He advises potential MOS customers to travel—to talk to the many vendors and to find out what custom design costs and when it can truly be justified. Many problems, though, will be uncovered only during actual detailed design. “A designer has to try custom design once or twice to come to understand the nitty-gritty problems,” Raisanen says.

He feels strongly that memory functions are best performed by hybrid technology—whether in one or a group of packages.
No other DVM offers 6 ranges of DC Volts, 7 ranges of Resistance and 6 ranges of DC Current for as low as $795. For the same $795, you get 100% overrange, 100 db Common Mode Rejection and resolution to 1 µV, 1 na and 1 milliohm. Current resistance sensing is 10 milliamps on the lowest range. It meets just about all the needs of the design engineer, production and the calibration lab—in a single instrument.

Want more? OK—How about dual-slope conversion, an unbreakable Cycolac® cabinet and extensive use of MSI for simplicity, reliability, light weight and compact size?—They're all standard. If additional options are your style, you can have 6 ranges of AC Current, 5 ranges of AC Volts, autoranging, display storage, BCD Outputs and even Rack Mounting.

Our new color brochure covers other great features and proves the Maxi-Ranger is the DVM of the '70s. We guarantee you'll swear by it—never at it.

See the Maxi-Ranger at IEEE, Booth 2K-33

THE MAXI RANGER
DC Volts
µV Sensitivity to 1000 V
Resistance
4 Wire Kelvin Measurements
1 Milliohm to 10 Megohms, F.S.
DC Current
1 na/digit Sensitivity to 1 Amp
“Circuit functions requiring high speed can be filled by bipolar components,” he says, “and those requiring low cost with MOS. This is what we do in our 8K-bit memory module.

“We’ve found it easy to design this structure so that the MOS interface is simple and direct. With low-threshold MOS, we get by with signal swings as low as 4 volts, which are easy to get with DTL. Complicated level shifters and special interface circuits can be avoided completely.”

The Motorola expert expects MOS-DTL combinations to be very popular.

“Vendors who had an early position in MOS have built up a big business base around high threshold MOS,” he says, “but you can’t have direct interfacing and high thresholds, too. Manufacturers who are new in the business, like Motorola, National and Texas Instruments, are making bipolar-compatible, low-threshold MOS, and they’re getting all of the new business.”

**Consumer ICs heading up**

Low-threshold MOS isn’t the only market segment due for sharp growth. Consumer ICs, which have been slow getting off the ground, now seem poised for a rapid climb.

At session 8A, “ICs for Consumer Applications,” speakers from GE, Delco Radio, RCA, Mullard, and Matsushita examine the current status of ICs in consumer items, the reasons for their introduction and the possibility of future market growth.

Increased performance and reliability are the prime reasons for using ICs in consumer goods, they say. Manufacturers work under a special constraint, however: The improved consumer item can’t cost more than its predecessor. This often leads observers to conclude erroneously that low cost is the prime objective.

Dr. Frank Stein, manager of semiconductor research and engineering at Delco Radio, Kokomo, Ind., points out that new integrated circuits must often substantially underprice their discrete counterparts, to cover the cost of tooling up for IC assembly. But he is confident that there is a tremendous potential for consumer ICs, especially in the automotive industry, where their reliability, performance and small size make them ideal.
IC reliability leads, of course, to low field-service requirements, and the IC structure lends itself to easy-to-fix modular construction. Service people don't need an in-depth knowledge of the circuits they replace—they can follow easy troubleshooting and replacement directions. Stein believes this will lead to fast service.

But not all semiconductor people share this view. Howard Bonner, applications manager for central marketing, Texas Instruments, feels that service personnel tend to slow innovation in consumer goods by resisting it. Theoretically, he says, IC consumer items are easy to repair, but field servicemen are afraid of them. Bonner contends that some transistor TV sets were pulled out of production because of massive problems with field repair. The service staff simply wasn't ready for the new technology, he says, and attempts at repair often led to ruined sets. ••

**Microwaves**

**Power tubes making a strong comeback**

Despite the inroads of solid-state devices, both thermionic and cold-cathode microwave power tubes have advanced enough to assure their presence on the design scene for some time to come.

Drive and output tubes have been combined in single packages, thereby simplifying high-power-stage design and providing better bandwidths. Modulation power requirements have been slashed, along with pulse and cw drive levels, thus simplifying and, in some cases, eliminating costly circuitry and components.

These and other improvements are discussed in Session 7C, “Recent Trends and Applications of Microwave Power Amplifiers.” The session was organized by R. A. Dehn, manager of microwave tube research and development for General Electric, Schenectady, N.Y.

An important accomplishment, Dehn points out, is the integration of essentially two tubes—a driver and output power stages—in the same envelope structure. Two examples are presented at the session.

**Coaxitron simplifies application**

One is the Coaxitron amplifier, a broadband two-stage, triode-tetrode device of megawatt peak rf output. It has been designed for airborne radar applications by RCA, Lancaster, Pa.

In a paper, “Coaxitron Amplifier,” J. A. Eshleman, engineer, and J. B. Pickard, product development engineer, say the typical output stage efficiency is 45% at 1.45 MW peak power, with an instantaneous bandwidth of 10% at a center frequency of 428 MHz.

The Coaxitron power stage has a complete rf input and output, along with triode electron interaction circuits, in the same vacuum envelope. Dielectric dissipation and arcing over are minimized as a result.

**New light on the Twystron**

The Twystron, a hybrid tube combining a klystron driver and TWT output structures, is another example of fabricating driver and output elements in the same tube. Although it was invented six years ago, Dehn notes, developmental applications have been military and classified, and little has been published about the tube.

Used in broadband, high-power radars, the Twystron, according to Richard B. Nelson, chief engineer of the Varian Tube Div. at Palo Alto, Calif., is a pulsed amplifier operating at 5-MW peak level with a 15% maximum bandwidth. The best comparable bandwidth available from TWTs is 10%, he says, while that of the klystron is only 8%. Nelson is delivering a paper, “A Twystron Hybrid Linear Beam Tube.”

The narrow, flat-topped bandpass in the Twystron is obtained by stagger-tuning the klystron cavities and by regulating cavity Qs. The relatively broad traveling-wave response is thus compensated for.

The operating frequency range of the Twystron is broad, Nelson points out, ranging from 400 MHz up to the millimeter waves. Tubes produced for use to date have been for C and S bands, simply because high-power radars operate in those regions.

The Twystron operates with about 40% efficiency for pulsed peak power outputs of from 1 to 5 MW. Average power at the peak 5 MW is about 20 kW.

In broadband radars, Nelson indicates, Twystrons are replacing the klystron and TWT and, in fact, have made the 1-MW TWT obsolete. In this sense, they've out-dated their own product, since Varian was the only manufacturer of 1-MW TWTs.

**Cw klystrons have dual grids**

A recent landmark in medium power cw klystrons has been the introduction of dual grids into the tube, providing a means of automatic frequency control, lowered noise, reduced modulation power requirements and higher efficiency.

These were design goals four or five years ago, according to George Caryotakis, manager of engineering for high-power microwave tubes at
Varian. In discussing these advances in “Applications and Requirements for CW Power Klystrons,” Caryotakis says that the improvements were obtained through better tube design by applying electron-optics theory and filter-design theory to the tube elements.

The new tubes, used primarily for military and satellite applications in the high C-band and at X-band, are medium-power cw devices, producing a maximum of 500 kW at 50% efficiency, although they can be used down to 1 kW. In pulsed applications, output power ranges from 2 kW to 100 kW.

Varian is beginning to put grids in a line of klystrons that have heretofore been cathode pulsed. The obvious advantage here is a substantial reduction of pulse driving power due, in part, to increased tube gains—20 to 30, instead of 10 to 20.

A single grid in a klystron is not new, Caryotakis says, but, in general, they have not been reliable because the grid intercepts tube current, overheats and fractures. While some single-grid tubes have been developed to overcome this, Varian’s latest development is the use of two grids, one ahead of the other.

The first grid, at cathode potential, shadows the second (control) grid, so that no emission takes place. This permits pulsing the tube with but 1/30th of the plate voltage, in contrast with cathode-pulsing the tube by applying or removing full power.

The reduction in power requirements and modulator circuitry provides a considerable weight saving for airborne applications. But, more important, Caryotakis says that in production quantities, the price of the tube is negligible when the savings on other components are considered.

Another big plus of the newest tubes is the fact that they can be tuned electromechanically, in contrast with a former complicated and time-consuming procedure that required an oscilloscope and sweep generator. As a result, tuning from a remote location by push-button operation is a possibility. This feature is particularly useful for satellite operation.

**Demotron has cold cathode**

One of the most interesting papers at the microwave tube session is “Characteristics of an RF-Keyed Cross-field Amplifier,” by J. R. M. Vaughn, senior research engineer in the Litton Industries Tube Div., San Carlos, Calif. It describes the development of a cold-cathode crossed-field tube called the Demotron.

The unique feature, as Vaughn explains it, is that it has no thermionic cathode; instead a cold cathode utilizes secondary emission. To obtain an rf output, it is only necessary to apply dc power and an rf input signal.

Developed from the original magnetron, Demotrons are now out of the laboratory and a commercial product. They are well-suited for pulse operation in the more sophisticated radars, which vary the frequency of the rf from pulse to pulse or even during the pulse.

Some of the C-band tubes already have a pulsed output power of 500 kW, with an average dissipation of 1.5 kW. And their instantaneous bandwidth of 10% is about the same as the high-power (100-kW) TWTs.

Whereas the TWTs need a pulsed modulator provides electromagnetic isolation and environmental protection (Session 7C).

that turns the power to the tube on or off, the Demotrons are simply connected to the operating dc, and, with no drive signal, they draw about 1 microampere in a cut-off condition.

The rf driving pulses are generated at milliwatt levels and are amplified by a chain of TWTs to drive crossed-field tubes in the last one or two power output stages.

The most serious problem in developing the tube was internal arcing, which is typical of many dc-operated microwave tubes. As a result, Vaughn says, Demotrons are invariably used with a “crowbar” on the power supply. But Varian developments have minimized such arcing from one arc every five minutes in the early developmental stages to better than one in four hours today.

The potential of the tube is great, Vaughn feels, and although it is not yet being used in production systems, he believes it will find substantial use in the next generation of radars.

Urban Technology

Environment pollution calls for a team cure

How will environmental pollution be controlled? Hubert Heffner, Deputy Director of the Office of Science and Technology in Washington, D.C., says that “interdisciplinary teamwork” will do it. The efforts of engineers, scientists, politicians and others will be involved.

Cleaning up our environment is an extremely complex issue, says Heffner. “Many aspects of it are social, political and economic,” he notes.

Heffner is the keynote speaker at Session 6D, “Environmental Pollution—Today’s Engineering Challenge.” His talk on the engineer’s task for tomorrow considers the importance of physical electronics and the need for a change in the training of engineers as they set out to solve the problems of air and water contamination.

Heffner points out that the atmosphere is accumulating increasing amounts of carbon dioxide and dust. “The CO₂ may imply that we’re going to raise the temperature of the earth and melt the arctic oceans,” he says. “On the other hand, if dust becomes more prevalent, it may go the other way, and we’ll have a colder climate.” He feels that environmental engineering will depend heavily on understanding the physical and meteorological implications of problems.

A change in training

Understanding, he continues, requires a change in the training of engineers. “For example,” he says, “there may well be a place for another kind of PhD, one which does not concentrate so heavily on the requirement for individual research as a contribution to new knowledge.” In addition to physics, Heffner says, a great majority of the environmental tasks require training in the social sciences, economics and other nonengineering subjects.

The chairman of the session, William E. Cory, director of electronic systems at the Southwest obstacle.
Known for consistent high quality and field-proven dependability, all Pirgo chips (dice) are 100% D-C probe tested, and are guaranteed to an LPTD of 10%.

High current NPN and PNP types (up to 30 amps) are available for immediate off-the-shelf delivery. They can also be obtained with gold backing for convenient, easy mounting to ceramic substrates.

There are economic advantages, too. Because no one else has lower prices, Pirgo transistor chips will bring down the cost of your hybrid circuit. You'll get top service...and all the technical advice you ask for. Affiliated with Sprague Electric Company, Pirgo draws upon the full resources and sales staff of that company.

Send directly for a copy of our new catalog and price list. Or call your local Sprague Electric sales engineer.
more than a power supply

You get more than a power supply when you specify this or any Hewlett Packard power supply. An international network of 220 sales/service offices are at your disposal... the most comprehensive service manuals detailing every aspect of the supply from theory and operation to troubleshooting... protection circuitry including an internal overvoltage "crowbar" to safeguard delicate loads, standard on this Low Voltage Rack (LVR) Series. OUTPUTS: 10V @ 20, 50, or 100A; 20V @ 10, 20, or 50A; 40V @ 3, 5, 10, 30, or 50A; 60V @ 3 or 15A. RIPPLE AND NOISE: typically 200μV rms, 10mV p-p. Remote Programming and lots more. Prices start at $350.

and you can customize it with these options...

- 10-Turn Output Voltage and Current Controls
- Chassis Slides
- 3-Digit Graduated Decadial for Voltage or Current
- 115V, 208V, or 230Vac Inputs
- 50Hz Input.
Research Institute, San Antonio, Tex., emphasizes that to control pollution, we must have effective legislation that will punish the polluters.

"I think it's quite obvious to most of the electrical engineers that the basic technology to monitor pollution has been developed," says Cory. "The problem is getting it to a point where it is cheap enough, reliable enough and small enough to be used at collecting sites." For example, instruments that have been developed need to be automated and distributed in the field.

Future monitoring techniques may involve the use of earth satellites, equipped with TV infrared cameras and with sensors to locate areas of contamination.

"We can detect and monitor pollution," says Cory, "but there has been little to actively prevent pollution through the use of electronics that do not create another form of pollution."

The interrelationship of problems and solutions is exemplified by the trend toward nuclear power. This would solve the problem of air contamination by smoke-belching power furnaces but nuclear reactors require large quantities of river or ocean water as a coolant—and this, in turn, is creating a thermal pollution problem.

**New instruments sought**

Robert S. Burd, Deputy Assistant Commissioner for Operations in the Federal Water Pollution Control Administration, Arlington, Va., another speaker at the session—sees a need for new instrumentation to monitor and detect contamination in rivers and oceans.

One project of particular concern to the federal administration is the 800-mile, 4-foot-diameter oil pipeline that will run from the Arctic Ocean at Prudhoe Bay to Valdez Harbor in southern Alaska. The pipe is to carry 500,000 barrels of oil a mile at a temperatures of 160 degrees F across the Yukon River and vast areas of federal land. A combine of oil companies—including Shell, Mobil and British Petroleum—have set mid-1972 as the completion date for the pipeline.

Burd expresses concern about protecting the environment, particularly because "this is an area that is active so far as earthquakes go." Instruments will be needed to detect not only leaks in the pipe but seismic disturbances that could create breaks that could, in turn, affect the ecology of the area.

The federal official says the Water Pollution Control Administration has raised the question of what happens when a hot pipe is placed in the permafrost—a combination of ice and soil that never thaws. He fears the pipe will be inclined to sink deeper into the ground and suggests that placing it on stilts above ground may be the answer.

Clare-Pendar presents the first LSI/MOS KEYBOARD

...a new concept in
- high reliability
- low power operation
- encoding flexibility
- interface compatibility with TTL/DTL/MOS
- low profile
- custom keyboard design
These six new devices expand dramatically your range of switching options. Now, you can conveniently interface semiconductor logic circuits with inductive loads such as motors, solenoids, or relays. Inputs as low as 5 microwatts can be used to switch 7 ampere loads, for example. Many millions of times, too.

Input/output isolation normally associated with relays is maintained. Installation is conventional, too... direct onto printed circuit boards or in a wide choice of sockets. These new products represent a happy melding of semiconductors and relays to enhance the qualities of both. Here is a look at tomorrow's switching devices. We have them today!

1 SOLID STATE/REED AC SWITCH Our JDB Series has a height of only .275". It offers the input/output isolation of a reed relay plus the power switching capability and long life of a thyristor. Its 1 Form A contacts will switch loads of 1.7 A rms at 25°C ambient for more than 10 million times.

2 AMPLIFIER-DRIVEN JOT RELAYS Signals as low as 25 microwatts will operate this modified version of our low profile, Thin-line JOT Series. Two dry reed contact forms are available: 2 Form A and 4 Form A. In the 2 Form A configuration, input voltages range from 5 to 24 VDC. In the 4 Form A package, from 12 to 24 VDC. This Series—our JDA—allows for 0.5" centers for printed circuit boards.

3 ALTERNATE, DIRECT-ACTION, IMPULSE RELAY This hybrid relay is unique. The DPDT relay employs a permanent magnet in parallel with its normal, single coil, magnetic circuit. Added to this is a solid state flip flop circuit. Thus, our KUR Series has both permanent memory and alternate action features and is controlled from a single, non-polarized, DC source. Contacts are rated 5 or 10 amperes. Because the KUR is designed to transfer its contacts when it receives a specified input pulse and then hold in that mode with or without power, it is recommended for on-off operation or alternate energizing of two loads.

4 AMPLIFIER-DRIVEN KUP RELAY The KUA Series significantly expands our family of KUP general purpose relays. Its sensitivity is in the 25 microwatts range... and its
New from P&B! solid state relay/hybrids that advance the art of switching

DPDT contacts will switch 5 amperes at 28 VDC resistive or 120V 60 Hz, 80% P.F. It is designed for continuous duty and to fit the wide choice of KUP sockets and enclosures.

**SOLID STATE HYBRID RELAY** Our EBT Series is a solid state AC switch controlled by a reed relay. This device will switch 7 amperes rms, 60 Hz at 25°C ambient. It is fast (operate time is approximately 2 milliseconds), and the relay provides input/output isolation. Coil voltages range from 6 to 48 VDC. Convenient octal-type socket mounting is provided. Life greater than 10 million operations can be expected.

**SENSITIVE SOLID STATE HYBRID RELAY** Our EBA Series is similar to the EBT (above) except considerably more sensitive. It will accept a signal of only 12 microwatts. It, too, will switch a 7 ampere load in 2 milliseconds and, like the EBT, incorporates an RC network for dv/dt suppression. As semiconductors accomplish the switching, it is bounce-free.

These devices widen the dimensions of electromagnetic switching. They are engineered and tooled. They offer a ready solution to going from low power logic sources to work-performing loads. Information is available from your P&B representative or contact the factory.

INFORMATION RETRIEVAL NUMBER 73
Reliability is a spring, a wheel and two thingamajigs.
Every AE Type 44 stepping switch comes with them.

One-spring power.
The drive spring is a coil. What it does is store up power. When it comes time to switch, the spring lets loose and moves the wiper assembly forward. Each time using precisely the same pressure.

Notice our spring is tapered at one end. It’s designed to perfectly match the power input. That’s why you always get the best possible transfer of energy.

At one end of the drive spring is an adjusting screw. We turn it a little this way or a little that way and the tension is always perfect.

Try that with a flat spring.

We re-invented the wheel.
The ratchet wheel is a little different. The way it’s made, for one thing. First, we blank it. Next, shave it. And finally, case-harden it. Then it’s super strong.

Notice the big, square teeth that always provide a sure bite.

A thingamajig with teeth.
That thingamajig next to the wheel is the armature assembly. When the teeth on the end of it mesh with the teeth on the ratchet wheel, they stop the wiper assembly and position it precisely on the contact bank. Smooth as silk, every time. No jarring, no jamming, no banging.

No adjustments, either. As the teeth wear, they just drop further into the wheel. So nothing ever gets out of whack.

A pawl that floats.
On the end of the armature is the pawl. We made it "free floating" to eliminate the jamming and binding that go with the old style pawl stop block. And while we were at it, we stopped pawl breakage and put an end to double-stepping or overthrow.

Don’t bother looking for this special set-up anywhere else. It’s patented.

The other thingamajig.
It’s called a contact spring. We’ve got some strong feelings as to what makes a contact spring strong.

In the first place, we believe there’s strength in numbers. So we put two sets of contacts on each spring. This means you get a completed circuit every time. Without fail.

But some of the credit for this has to go to our solving the most common cause of contact failure—the build-up of insulating films on the contact points.

We make each set of points self-cleaning. That way, the bad stuff doesn’t have a chance to build up.

Finally, take the buffers. We make ours of a special, tough phenolic material that lasts. And lasts. And lasts. All without wear or distortion.

To make sure they stay in place, we weld the buffer cups to the contact springs. We weld, rather than use rivets, because our lab found that rivets have a habit of falling off or wearing out.

Seeing is believing.
We could go on talking reliability and tell you about our testing and run-in room. There’s a lot more to tell. But we’d rather have our Sales Representative show you. And let you see first hand the reliability that’s built into every AE stepping switch.

Just call or write.

Computer Communication Cooperation CLEAR—a. O. Atkinson, Computer Center for Cincinnati, Ohio. (7F.3/Thur./a.m./MH)

Trends in Transportation Computer Application for the 70's—W. P. Ollman, Chicago and North Western Railway, Chicago, Ill. (7F.4/Thur./a.m./MH)

Maintenance Planning for a Reliable Process Control Computer—P. K. Matthiessen, Sun Oil Company, Marcus Hook, Pa. (8C.1/Thur./p.m./SN)

Computer Control of an Automated Warehouse—L. P. Christianson, IBM, San Jose, Calif. (8C.2/Thur./p.m./SN)

Education and Management

The Fatal Abstract—a Pedagogical Farce in One Act—Session Chairman, J. M. Lufkin, Honeywell, Inc., Minneapolis, Minn. (1P/Mon./a.m./SS)

Text-to-Speech Conversion; Giving Clarity and Style to a Talking Computer—C. H. Coker, BTL, Murray Hill, N.J. (4F.1/Tues./p.m./MH)

Cross-Fire Lecture Technique—Bradford Daggett and Alfred Petecolas, Institute for Professional Development, RCA, Clark, N.J. (4F.2/Tues./p.m./MH)

The Tape Revolution in Communication—Frank Siedel, Starck, Inc., Lakewood, Ohio. (4F.3/Tues./p.m./MH)

Multi-Screen Mixed Media—Victor Jackson, Melandrea, Inc., New York, N.Y. (4F.4/Tues./p.m./MH)

CCTV in Graduate Education—The SMU Experiment—C. R. Vail, Southern Methodist University, Dallas, Tex. (5D.1/Wed./a.m./SS)

Computer Education for Engineers—Session Chairman: J. A. Reilly, Kenyon & Kenyon, New York, N.Y. (6E/Wed./a.m./N)

Continuing Technical Education at BTL—A Philosophy; Planning and Implementation—E. D. Reed, BTL, Murray Hill, N.J. (6E.1/Wed./p.m./N)

Continuing Education in Industry as a Resource Management Activity—S. E. Moore, IBM, Poughkeepsie, N.Y. (6E.2/Wed./p.m./N)

Comar now unveils its complete new CR-2 series: The only relays that give you single-pole, double-pole or three-pole specifications. Undoubtedly, you've seen and heard of our new single-pole relay, (we call it our "one track mind"). That's when you need only one make-and-break. Now Comar initiative makes it even easier than ever. Need two make-and-breaks? Specify the two-pole relay. Same for our new three-pole relay. They're all the same compact size: 11¼" x ¼" x 59/64". They're compatible with one another so that two 3-pole relays placed side by side, for example, will give you six poles . . . in less space than you needed before for two 4-pole relays. Less expensive than the 4-pole relay too. Better balanced. Yet built with the same exacting quality that Comar builds into all their relays.

Mix or match any of the new CR-2 relays to obtain the exact number of functions you need—for five poles combine our 2- and 3-pole relays. For seven poles use our 3- and 4-pole relays. "Get one free" by mailing the coupon, but, if you have more in mind, just tell us your problems. You'd be amazed at what we have that we haven't shown you.

Contact Rating: 4 amps at 120 volts A.C. resistive and 4 amps at 30 volts D.C. resistive.
Coil Voltage Range: Up to 115 Volt D.C. Complete with dust cover. Socket available.

New! Comar CR-2 Relays • Single-Pole • Double-Pole • Three-Pole
THE CHILLER

Cold. Calculating. Mechanically refrigerated. Yet, at times, warm . . . even hot. Called by those who know . . . Tenney Jr. Inside 1¼ cu. ft. of emptiness waiting for you and yours. Get it. Sit it on your bench-top. Watch it pull down from ambient 75°F to —120°F in 55 minutes. Or, if heat is your hang-up, watch it zoom to +350°F in 35 minutes. Either way with ±1/4°F control and no RFI. Write or call us about Tenney Jr. today. We'll see that you get yours.

T Jr: $1080 — Available immediately from stock. Also ask about the Tenney SST, only $890.

Electro-optical

Applications of Non-Linear Optics—P. Kaminow, BTL, Holmdel, N.J. (1A.2/Mon./a.m./T)

Upconversion: A New Technique for Infrared to Visible Image Conversion—A. H. Firsner, RCA, Princeton, N.J. (1A.3/Mon./a.m./T)

Amco builds enclosures to last. With plenty of muscle like 14 gauge, double welded, 4 formed horizontal and vertical frame members. Full heliarc seam welds on all corners, top and bottom. Sturdy multi-formed mounting channels for flush or recessed panels. Direct floor bearing support with extended vertical frame channels. 12 gauge gussetting that will handle loads in excess of 2000 lbs. Integral lift-eyes. And, all of these are standard construction. That's just for starters.

We structurally test our enclosures and publish the certified test results. Here's an example of the brutal military tests these enclosures can take:

**SEMI-CUSTOM ENCLOSURES:**
- MIL-E-5572C Vibration test procedure XII
- Shock test—procedure III (MIL-S-901B)
- Shock test—procedure V (MIL-S-4456)

**E.M.I. ENCLOSURES:**
- Vibration test—MIL-STD-167 Type I.
- Shock test—MIL-S-901C
- Electromagnetic interference test—Requirements & test methods MIL-STD 826
- Radio Frequency Electric Field Attenuation Measurements for shielded equipment enclosures MSFC-STD-280
- Units with 14 ga. C.R.S. components also meet MIL-STD-285

Besides all this, you can have your own computer age cabinet look with Amco's INTERFACE-33 enclosure styling system. These enclosures have all the strength features mentioned above and the cost for styling is only about $40 per cabinet. Best of all, there's practically no limit to the styling combinations you can choose for single or multiple bay consoles. Add realistic delivery dates, plus competitive pricing and you'll find it's hard to beat Amco quality and service.

... and only DELTRON gives you

in every one of its full line of standard and custom POWER SUPPLIES

All DELTRON Power Supplies are meticulously engineered with EDM (EXTRA DESIGN MARGIN). This means that every electrical and mechanical part is rated for the extra service that permits each power supply to withstand inadvertent or uncontrollable stresses that would damage or seriously impair the life of competitive units. And we have a track record of some of the most important state-of-the-art developments in the power supply field. Don't buy another power supply before looking over Deltron's new comprehensive catalog.

INFORMATION RETRIEVAL NUMBER 81
If memory is your thing, you need Computer Microtechnology memories. The first one is ready, the CM 2100 64 bit bipolar read/write memory. It features the best minimum write pulse width in the industry, 12 nsec typ. This combined with the other specifications gives you superior units for your applications. All decoding, driving and sensing circuitry is on the chip of this self-contained memory. You can achieve memory expansion simply through chip select input and wired-OR capability of outputs. The CM 2100 is ideally suited for high speed scratchpad or buffer memories. Do your thing. Check the specs and then order your CM 2100 memories today. PRODUCT LINE: 64 BIT, 256 BIT, 4096 BIT MEMORIES.
DELIVERY FROM STOCK

a series of DUAL OUTPUT POWER SUPPLIES

FROM $4900

for OP AMPS and IC'S

An exceptional value, the new Deltron OS/PS Series are Independent Dual Output Power Supplies for use with operational amplifiers, integrated circuits and digital logic. Check these features—

• 0.02% regulation
• 500 microvolts ripple and noise
• 10 microsecond recovery time
• Master-slave series and parallel
• Built to top quality standards
• MIL P-13949 & MIL A-8625
• Plug/wire in — compact design
• All Silicon . . . 71°C operation

DELTRON

Semiconductor Memory—R. Rice, Fairchild Semiconductor Research, Palo Alto, Calif. (6A.2/Wed./p.m./T)

Microwave Integrated Circuits for Avalanche Diode Applications—G. Basawapatna, Microstate Electronics Corp., Murray Hill, N.J. (6F.1/Wed./p.m./MH)

Monolithic and Hybrid Technology for Microwave Integrated Circuits—B. Dodson, F. Emery, Texas Instruments, Dallas, Tex. (6F.2/Wed./p.m./MH)

Thick vs Thin Film Assembly Techniques for MIC's—J. F. Bunker, Microwave Associates, Burlington, Mass. (6F.4/Wed./p.m./MH)

Design of MIC's by Optimal Seeking Computer Techniques—C. J. Lump, U.S. Army Electronics Command, Fort Monmouth, N.J. (6F.5/Wed./p.m./MH)

The Problems and Promises of Micro-electronic Interconnection Processes—A. S. Rose, RCA, Somerville, N.J. (7A.1/Thurs./a.m./T)

Beam Lead Chip Interconnection Systems—M. McKinnon, Western Electric Inc., Princeton, N.J. (7A.2/Thurs./a.m./T)

The STD Interconnection Systems—J. P. Dietz, General Electric, Syracuse, N.Y. (7A.3/Thurs./a.m./T)

Flip Chip Interconnection Systems—L. F. Miller, IBM, Hopewell Junction, N.Y. (8A.1/Thurs./p.m./T)

Integrates for Household Appliances After Careful Value Study—C. E. Wellman, General Electric, Syracuse, N.Y. (8A.1/Thurs./p.m./T)

Integrated Circuits in the Automobile Radio—T. C. Endo, GME, Kokomo, Ind. (8A.2/Thurs./p.m./T)

The Transition of LID's in Television Receivers—R. T. Santilli, RCA, Somerville, N.J. (8A.3/Thurs./p.m./T)

Consumer Integrated Circuits in Japan—Hiroyuki Hozumi, Matsushita Electric Indus., Osaka, Japan. (8A.5/Thurs./p.m./T)

Integrated Circuits in Array Design—W. T. Patton, D. Staiman, RCA, Moorestown, N.J. (8B.4/Thurs./p.m./M)

Gallium Arsenide Transferred-Electron Oscillators and Amplifiers—F. Styer, RCA, Princeton, N.J. (5A.2/Wed./a.m./T)

Gallium Arsenide P-N Junction and Schottky Barrier IMPATT diodes—W. G. Mattes, Raytheon, Murray Hill, N.J. (5A.3/Wed./a.m./T)

High-Efficiency Avalanche Diode Microwave Sources—K. K. N. Chang, RCA, Princeton, N.J. (5A.4/Wed./a.m./T)

Power Combination with Diode and Circuit Arrays—J. W. Gewartowski, Bell Telephone Laboratories, Murray Hill, N.J. (5A.5/Wed./a.m./T)

Microwave Integrated Circuits for Avalanche Diode Applications—G. Basawapatna, Microstate Electronics Corp., Murray Hill, N.J. (6F.1/Wed./p.m./MH)

Monolithic and Hybrid Technology for Microwave Integrated Circuits—B. Dodson, F. Emery, Texas Instruments, Dallas, Tex. (6F.2/Wed./p.m./MH)

Thick vs Thin Film Assembly Techniques for MIC's—J. F. Bunker, Microwave Associates, Burlington, Mass. (6F.4/Wed./p.m./MH)

Design of MIC's by Optimal Seeking Computer Techniques—C. J. Lump, U.S. Army Electronics Command, Fort Monmouth, N.J. (6F.5/Wed./p.m./MH)

The Coaxitron Amplifier—J. A. Eshleman, J. B. Pickard, RCA, Lancaster, Pa. (7A.1/Thurs./a.m./SN)

Applications and Requirements for CW Power Klystron—C. Caryotakis, Varian Associates, Palo Alto, Calif. (7C.2/Thurs./a.m./SN)

The Twystron Hybrid Linear Beam Tube—R. B. Nelson, Varian Associates, Palo Alto, Calif. (7C.3/Thurs./a.m./SN)

Characteristics of an RF-Keyed Crossed Field Amplifier—I. M. Vaughan, Litton Industries, San Carlos, Calif. (7C.4/Thurs./a.m./SN)

TWT Versatility Extended by Integral Heat Pipe—L. H. Hershenson, K. G. Wood, Hughes Aircraft Co., Torrance, Calif. (7C.5/Thurs./a.m./SN)

Short Backfire Antennas—B. C. Reynolds, Radiation Systems, McLean, Virginia. (8B.1/Thurs./p.m./M)

Feed for Large Dishes—F. A. Lawrence, Rantec Corp., Grenada Hill, Calif. (8B.2/Thurs./p.m./SN)

Aircraft Antennas for Satellite Communications at UHF/SHF—C. A. Linberg, MIT Lincoln Lab., Lexington, Mass. (8B.3/Thurs./p.m./M)

Integrated Circuits in Array Design—W. T. Patton, D. Staiman, RCA, Moorestown, N.J. (8B.4/Thurs./p.m./M)

Microwaves

A Millimeter Waveguide Transmission System—I. Welber, BTL, Holmdel, N.J. (3B.1/Tues./a.m./M)

The Waveguide Medium: Manufacturing Challenge—T. Nakahara, Sumitomo Electric Industries, Ltd., Osaka, Japan. (3B.2/Tues./a.m./M)

Millimeter Waveguides: The Installation and Maintenance Challenge—E. E. Sumner, BTL, Whippany, N.J. (3B.3/Tues./a.m./M)

Optical Transmission Research—R. Kompner, BTL, Holmdel, N.J. (3B.4/Tues./a.m./M)

Session Topics in Perspective to Other Microwave Power Sources and Amplifiers—B. Hoefflinger, Cornell University, Ithaca, N.Y. (5A.1/Wed./a.m./T)

Oceanography

Operational Lessons in Deep Ocean Search—F. A. Andrews, Catholic University, Washington, D.C. (2F.2/Nov./p.m./MH)
The new Cyclohm Fan from Howard vs. "the other fan"

The new Howard tubeaxial fan delivers a larger volume of air over a wider range, runs up to 10 years without service or lubrication, has a rugged cast aluminum frame, yet costs about the same as "the other fan" you're now using. (See why we call the comparison "unfair"?)

In all fairness, we admit the new Howard Cyclohm fan is exactly the same size as "the other fan." They're interchangeable. But then we come to comparisons like Howard Cyclohm's six-blade impeller (vs. three) which is computer-mated to the famous Howard Unit Bearing Motor with a 5-year warranty based on an engineered lifespan of 10 years (vs. a traditional bearing motor). Then, too, there's 115 CFM air delivery (vs. 100). And cost: The new Howard Cyclohm never costs more than "the other fan"... and Howard delivery is overnight!

Be fair to yourself: Send for all the unfair facts.

Introducing a new range of NPO CHIP CAPACITORS

For exceptional stability where performance requirements for low capacitance are critical!

These tiny, monolithic NPO Chips (VJ0805) offer capacitance values from 1.0 to 9.1 pf in a .080 x .050 size. They have a temperature range from -55°C to +125°C and offer exclusive noble metal terminations - a design feature of all Vitramon "Vee Jem" Chip Capacitors - to assure exceptional bonding capabilities. Immediately available in quantity to meet your production schedule. For complete specifications, write for Data Sheet C27.
There's a one micron difference in these mesh screens magnified 100,000* times

Can you see it?

Not likely. You couldn't spot a 25 micron difference in these screens with the human eye, let alone one. We picture the enlarged micro-mesh screens because we regularly produce mesh to micron tolerances, or even millionths of inches.

Buckbee-Mears has all sorts of exotic capabilities in electroforming and the precision etching of metal and glass. We've been making precision parts since we began etching metal fire control reticles for the military in World War II. Today, with our automated computer-plotter system (BMAPS), we can do things 20 times faster than a few years ago. And do them more accurately, too.

For example, we electroform standard stock sieves down to 5 micron hole sizes, guaranteed accurate within ± 2 microns. In quantity. We can do even better on special orders.

If you need a little less precision—for fewer dollars, of course—check our prices and delivery times for more routine etched metal or glass parts. We can make virtually any part that can be drawn on paper. Our prices are fair, and we think 15 days is long delivery.

Solving problems for people like you is our business. We have a long list of blue chip companies we've helped, and we'd like to add you to the list. Call or write Bill Amundson, Industrial Sales Manager, today. His number is 612-227-6371.

No problem is too small for us.

The new lil' Ubiq®, the smallest real-time spectrum analyzer for on-line frequency measurements of noise, vibration, and underwater signals.

Now there are two basic real-time spectrum analyzers, each designed for a specific job.

The big Ubiquitous UA-6A for the lab is the finest, most flexible and precise instrument, to determine significant parameters during the R&D phase of study.

And now the new lil' Ubiq UA-10 — the smallest, easiest to operate, for use in the field, right at the source of the signals or in production where portability and economy are important, but where the highest speed and resolution are not required.

For special requirements, we make the 1000-line UA-9 with twice-as-fine resolution as the UA-6A; and the 100 kHz UA-8H, which operates five times as fast as the UA-6A.

We also make cross-PSD, correlation, and analyzer-computer systems.

Call us for a real-time solution to your signal processing problems.

U Series panel with
point to point wiring
saves time, space and money

- Available in multiples of 9 row sections up to 54 rows.
- Each 9 row section accepts 3 plugs for interfacing or input-output connections.
- Accepts 14, 16, 24 and 36 lead Dual-in-Line integrated circuits.
- Double sided board with power and ground planes connected to additional wire wrap terminations outside of contact row.
- Wire wrap terminations with tri-level connection length.

Request complete I.C. folder.

9—count 'em—9 resistors in this 1/4" x 1/4" sandwich

Ceramic resistor flatpacks from MEPCO

In addition to this 1/4" x 1/4" package for up to 9 resistors, there's a 1/4" x 1/2" size for up to 13 resistors, and a 1/4" x 3/8" size for up to 19 resistors. All meet the environmental requirements of MIL-STD 202. These precision, thick-film networks eliminate stocking of a wide variety of resistors when a pattern of values is used repetitively throughout a system. Try them as pull-up resistors for IC logic networks, voltage dividers, miniature attenuators and matching networks, ladder networks or precision feedback resistors for operational amplifiers. Mepco mass produces these miniature ceramic-enclosed cermet resistor packs sealed with a high temperature polymer. To meet your specifications. At miniature prices. Send for complete data.

MEPCO, INC. Columbia Road, Morristown, N. J. 07960
Are you a forgotten man to everyone except your family -- and Uncle Sam?

If the figures on your Form 1040 reminded you of the job advancement you did not get this year, what are you going to do about it?

We believe that advancement may depend as much on being in the right place at the right time as it does on ability. If you agree, you should look into what's happening at NCR.

NCR is now the second largest company in the world in the computer systems business—supplying hardware and software answers for a whole world full of expanding markets. But the more answers we work out, the more questions we stir up.

That's why we are still growing rapidly. Why we need more engineers, of all degrees. More physicists, too. And software people. That's why NCR could be the right place—and now the right time—for you to advance your career.

In many positions you would be handling significantly more responsibility than you do now, because our employees advance as fast as they are able to assume additional duties.

Tell us about your background and career objectives. Write:

T. F. Wade, Executive and Professional Placement
The National Cash Register Company, Dept. ED-3
Dayton, Ohio 45409.

We are an Equal Opportunity Employer M/F

one of our advanced subsystems, the opto-hybrid

detects small changes of input, amplifies and digitizes output • channel-to-channel uniformity of ± 10% (important with translucent tape) • digital output DTL or TTL compatible • available with either low or high true level output • amplification right at the detector minimizes influence of noisy electrical environment • cost comparable with discrete component amplifiers and sensing array—a dramatic size/weight advantage • works equally well with LED or incandescent source • fits into existing systems with little or no redesign...any number of detectors in almost any specified package

<Shown — 9 channel tape reader version.

proof of the benefits of controlled crossbreeding—our new opto-hybrid

We've been making semiconductors a long time. Our list of "firsts" is impressive...particularly so in miniaturization of discrete silicon hi-rel devices. And, our assignment to produce silicon solar cells for the U.S. Space Program (we're #1) has kept us extra sharp in photovoltaics. Add to that our recent high-level R & D and technical work force build-up and you can see why right inside our plant is the best source for solutions to your hybrid circuit problems—whatever they may be. Bring us those problems. We'll solve them quickly and economically!

zeners, temp.-compensated devices, tunnel diodes, rectifiers, scr's, semiconductor chips, hi-rel hybrids and photovoltaic products

Four-channel oscilloscope with digital readout and a four-trace display allows simultaneous viewing of inputs and outputs from digital ICs or flip-flops. This new instrument also features a bandwidth of greater than 1 GHz. Waveform voltage measurements can be made on any one channel. See p. U140.

Monolithic photodiode array includes 51-bit on-chip shift register with its 50 photodiodes. p. U146.

Plug-in modular IC logic-card system extends the do-it-yourself concept to logic designs. Able to choose from over 100 standard off-the-shelf integrated-circuit function logic cards, the designer can now do the simple logic himself. Up to 16 wire-wrap IC sockets can be accepted by a single PC-board module. p. U138.

Trim digital multimeter, which virtually eliminates kickback current, can make voltage measurements in high-resistance circuits at its stated accuracy. This 3-1/2-digit instrument also offers 50% overranging and a sampling rate of six times per second. Protective circuitry allows input voltages as high as 1000 V. p. U140.
Modular a/d and d/a converters boost performance, drop prices

Datel Corp., 943 Turnpike St., Canton, Mass. (617) 828-1890.
P&A: see text; 2 weeks.

Making its mark in the highly competitive epoxy module market, Datel Corp., who is exhibiting for the first time at IEEE, is introducing several new lines of a/d converters and d/a converters.

The a/d converters consist of two basic types: series ADC-E which uses a dual-slope-integration conversion technique; and series ADC-L, M and H which use a modified successive-approximation conversion method.

Designed primarily for industrial and process control applications where noisy environments are a common problem, series ADC-E units achieve accuracies of ±0.05% at costs ranging from $99 to $149. They can handle 8, 10 or 12 binary bits or 3 BCD bits, and have a maximum conversion word rate of 3 kHz.

Series ADC-L, M and H units offer accuracies of ±0.05%, ±0.025% and ±0.1%, respectively, with price tags of $225 to $900.

Maximum conversion word rates are 25 kHz, 250 kHz or 2.5 MHz. Resolutions are 6, 8, 10, or 12 binary bits or 3 BCD bits.

All of the new converter series accept unipolar or bipolar inputs with voltage ranges up to ±10 V. In addition, their outputs are compatible with DTL/TTL circuits. Module size is identical for all the units—2 x 4 x 0.4 in. Available options include a 10-channel MOSFET analog multiplexer and sample-and-hold modules.

Emphasizing self-sufficiency, the new d/a converters include: input interfacing logic that is DTL/TTL compatible, high-speed electronic switches, a temperature-compensated voltage reference source, precision ladder networks, and an output buffer amplifier.

The HybiDAC series, which sells for $69 to $119, provides resolutions of 8, 10 or 12 binary bits to an accuracy of ±0.05%. Their output settling time is 5 ms to ±0.05% of the final output value. Measuring but 1.5 x 2 x 0.4 in., these units provide a temperature coefficient of 30 ppm/°C.

Series DAC-I units shorten settling time to 150 ns within ±0.025% of the final output value. Their unit costs range from $115 to $165, and module size is 1 x 2 x 0.4 in. Like the HybiDAC devices, these converters can handle 8, 10, or 12 binary bits, in addition to 3 BCD bits. Temperature coefficient is 15 ppm/°C.

Offering the same resolutions as the DAC-I series, the DAC-V d/a converters are priced from $129 to $189. Their output settling time is 2 µs to ±0.05%, while output amplitude is ±10 V at 10 mA. The units, which measure 2 x 2 x 0.4 in., provide a temperature coefficient of 20 ppm/°C.

The fourth series of this new d/a converter line is labeled DAC-H. Featuring an extremely fast output settling time of 30 ns to ±0.1%, these devices can handle either 8 or 10 binary bits. Their maximum output voltage is 1 V at 5 mA, while temperature coefficient is 15 ppm/°C. Prices range from $149 to $169 for the DAC-H modules, whose sizes are 2 x 2 x 0.4 in.

Also being shown for the first time at the IEEE show are two new power supplies. They are said to be the first line-operated dc power supplies in a package that is less than one cubic inch. Model UPM-5/1A uses an input voltage of 115 V ac to produce an output voltage of 5 V dc. Its output current is 1 A, and load regulation is ±0.05%. The unit measures only 2 x 2 x 0.4 in., and costs just $89.

The model BPM-15/150 power supply also operates with an input voltage of 115 V ac. Its output, however, is ±15 V dc at 150 mA. Load regulation for this unit is ±0.05%. Like the model UPM-5/1A, the BPM-15/150 is a 2 x 2 x 0.4-in. module that has a price tag of $89.

Both supplies can drive digital and linear integrated circuits. 

Booth No. 3B29 Circle No. 364
Full performance at a price you can afford

You don't have to be a Scotsman to know that you pay more for top performance. So if we told you this new 3-digit DPM was made to sell for less than $115 in OEM quantities, you'd figure its performance at something less than that delivered by our higher priced models.

But you'd be wrong. And here's why.

First of all, our initial objective was to develop an instrument for OEM measurement needs of the scientific and medical community. Obviously, price was an important factor. But so was performance. The happy solution was to eliminate a few of the more exotic functions that these users normally don't require. For example, 100% overrange and standard BCD output (an option available on Model 1261).

Secondly, instead of compromising performance, we've actually improved it! Model 1261 is a basic 0-99.9 millivolt DC meter with 50% overrange capability, 100 microvolt resolution, long-term stability, 50 megohm input impedance, high rejection characteristics, and Weston's patented dual slope® circuitry. It's packaged in the plug-in case that's common to all our DPM's, giving you Weston front panel serviceability.

This latest addition to our DPM family brings .1% accuracy within range of practically everyone's budget. Make your own comparisons, spec for spec, with other digital compacts on the market. Write today for complete data and ranges available.

WESTON INSTRUMENTS DIVISION, Weston Instruments, Inc., Newark, N.J. 07114, a Schlumberger company

*U.S. Pat. #3,051,939
Economy 0.1% multiplier spans 100-kHz bandwidth

Analog Devices, Inc., 221 Fifth St., Cambridge, Mass. Phone: (617) 492-6000. P&A: $175 or $225; May, 1970.

Striking a happy medium in the cost-performance trade-off game, a new analog multiplier module achieves accuracies of ±0.1% and a bandwidth of 100 kHz, while holding price down to $225. In addition, model 424K features a linearity of ±0.04% and a full-power response of 30 kHz.

For applications that do not require as stringent an accuracy, a second new multiplier, model 424J, fills the bill. It too has a 100-kHz small-signal bandwidth and a 30-kHz full-power response, but its accuracy is ±0.2% (to 1 kHz) and its linearity is ±0.08%. The 424J is also less expensive—only $175.

Both of these computer-grade multipliers use pulse-height/pulse-width modulation and are, therefore, basically carrier devices. Their X and Y input signals modulate an internally generated multivibrator signal, whose average output is proportional to the product of the input signals. The X input controls the duration of the multivibrator output, while the Y input controls amplitude.

Output information is extracted from the multivibrator signal by low-pass filtering. This produces a signal that is proportional to the instantaneous average value of the carrier pulses.

Filtering removes the carrier harmonics, but gives a net frequency response that is usually only one-tenth the carrier frequency. To attain their 100-kHz bandwidth, the new multipliers use a 3-MHz carrier, instead of the 50- to 100-kHz one employed by previous devices.

Wideband amplifier settles in 80 ns

With a minimum slewing rate of 400 V/µs, a new wideband amplifier settles to 0.1% in 80 ns maximum, or to 0.1% in 300 ns maximum. The output of model FS-23 is ±10 V at 30 mA, and its typical voltage drift is 20 µV/°C. Setting time includes slew-rate limitations, and overshoot and delay. Some applications are d/a converters and pulse amplifiers.

Rack-mount supplies boast 75-A output

Dynage Inc., 1331 Blue Hills Ave., Bloomfield, Conn. Phone: (203) 243-0315. P&A: $525 typical; 4 wks.

Initially available in five different case sizes, series L power supplies provide high efficiency and high current outputs with full overvoltage and overcurrent protection. A typical unit has a rating of 5 to 5.5 V at 75 A, and is packaged in a rack-panel configuration just 3-1/2-in. high. Standard voltage ratings for all five case sizes are 5.25-V nominal output, along with 12.5 and 15.5-V units.
With Tektronix 7000-Series Oscilloscopes

versatility begins with the mainframe

The New Tektronix 7000-Series Oscilloscopes feature vertical and horizontal amplifiers with dual inputs. This means the mainframe amplifiers can be time shared by up to four plug-ins for unmatched display versatility. Up to 20 combinations of vertical and horizontal operating modes are possible. Simultaneous measurements can be made by multiple plug-ins with widely different features. Voltage and current, real time and sampling, high-gain differential and dual trace, delaying and delayed sweeps are just a few examples. Many applications which formerly required a true dual-beam oscilloscope are now solved by mainframe amplifiers which simulate dual-beam performance.

With mainframe versatility, and four plug-in capability, a wider range of measurement problems can be solved with only one oscilloscope.

Thirteen New plug-ins covering a wide performance spectrum complement the versatility of the new Tektronix four plug-in oscilloscopes. More plug-ins are initially available than in many oscilloscopes even years after introduction. Today, you can choose a New 7704 (150 MHz) or 7504 (90 MHz) Tektronix mainframe with unmatched versatility, confident that plug-ins are ready to solve virtually all of your multi-trace, differential, sampling, or X-Y measurements.

For measurement ease, Auto Scale-Factor Readout labels the CRT with time/div, volts or amps/div, invert and uncal symbols and corrects for probes and magnifiers. All the data is on the CRT, where you need it to make faster measurements with fewer errors. And, looking into the future, the readout system is designed to meet needs other than those of today’s plug-ins. You can solve more measurement problems easier and quicker with an oscilloscope where VERSATILITY begins with the mainframe.

Your Tektronix Field Engineer will gladly discuss with you the complete VERSATILITY of the New Tektronix 7000-Series Oscilloscope System. Contact him locally or write: Tektronix, Inc., P. O. Box 500, Beaverton, Oregon 97005. See your 1970 Tektronix catalog for specifications.

Prices of instruments shown:
7704 150-MHz Four Plug-In Oscilloscope $2500
7A16 150-MHz Single-Trace Amplifier $600
7A14 105-MHz Current Amplifier $75
7B71 Delaying Sweep Time Base $885
7B70 Delayed Sweep Time Base $600

INFORMATION RETRIEVAL NUMBER 95
Reference ladder switch lowers offset to 2 mV

Micro Networks Corp., 5 Barbara Lane, Worcester, Mass. Phone: (617) 756-4635. P&A: $60; stock.

Featuring a low series resistance of 20 Ω, a new negative-reference ladder switch has a low offset voltage of 2 mV maximum. The MN203 has a pair of spdt switches that drive resistance ladders for d/a circuits. Its input is compatible with monolithic logic circuits and its output delivers ground or -10 V to the ladder. Units are available to drive up to 14-bit d/a circuits.

Booth No. 4G11 Circle No. 342

Modular multiplier boasts 1% accuracy

Without using external trimming potentiometers, a new multiplier offers an accuracy of 1% maximum. The model 605 modular unit features an output offset drift of only 2 mV/°C and a gain error drift of only 0.03%/°C. Its full-output frequency response is 100 kHz and small-signal response is 500 kHz. It is short-circuit proof and measures only 1.5 × 1.5 × 0.625 in.

Booth No. 2H19 Circle No. 338

Display module lights up 50 dots

The Glo-Cator is a new high-density lighted display module that displays the condition of as many as 50 switches in dots of clearly defined light on a matrix pattern. It incorporates its own lamp driver and test circuits and operates from 5-V logic at low currents. Any number of units can be combined in any direction to duplicate a matrix pattern.

Booth No. 3A12 Circle No. 336

Small decade counter works at 10-MHz rate

Only one-sixth of a cubic inch in volume, the Midgi-Counter is a miniature decade counter that can operate at rates up to 10 MHz. Compatible with IC circuitry, the unit counts a TTL data pulse and then converts it to a seven-segment code. Both military and commercial versions are available. All models are designed for 5-V operation, and feature automatic zero blanking.

Plug-in IC logic-card system permits customized designs

Datacasan, Inc., 1111 Paulison Ave., Clifton, N.J. Phone: (201) 478-2800. P&A: $47 for basic board, $4 per socket for wiring, $2 average per IC; stock.

Extending the do-it-yourself concept to logic circuits, the Wrap-X logic-card system allows the engineer to select the complex function cards he needs and then do the simple logic himself.

Key to this concept is the Wrap-X printed-circuit-board module, which contains 16 wire-wrap sockets for 14-pin ICs and/or 16-pin MSI chips. The true significance of this new Wrap-X card is its mechanical compatibility with over 100 standard off-the-shelf function logic cards—like decimal converters and shift registers.

The Wrap-X card system competes with the large-scale backplane approach. Wrap-X, however, offers an economic advantage for use in small systems or for prototype quantities of large systems. Complex function cards, for example, cannot be economically duplicated with a backplane approach.

In addition, backplane methods require very complex wire-wrap interconnections to replace the function cards. Therefore, an extensive run list and many hours of engineering time are often necessary. In contrast, most of the interconnections are plated in the Wrap-X system.

Another consideration is that discrete components and semiconductors must be housed on plug-in platforms when the backplane approach is used. Each of these platforms requires a physical design before the run list can be generated. This also frequently entails many hours of design and drafting time. In the Wrap-X standard-card system, the function cards are already designed and layed out.

The wiring for large backplane units is usually more extensive than for the Wrap-X system because all of the plated interconnections on the function cards must be hard wired. In backplane systems then, there is a risk of noise problems because summing junctions and other low-level signal points must be tracked over some distance, and may be mixed with digital wiring.

An additional Wrap-X feature is dynamic decoupling.

Scientific calculators use MOS LSI circuits

Litton Industries, Monroe Div., 550 Central Ave., Orange, N.J. Phone: (201) 673-6600.

Employing MOS LSI technology, four electronic calculators are sophisticated scientific machines that can make decisions, as a computer does, in a portable 12-pound desktop package. Series 1600 units consist of two display models and two printing models. They have 10 data storage registers, and provide standard decimal and scientific decimal notation.

Endless loop cassette leans on single hub

TDK Electronics Corp., 23-73 48th St., Long Island City, N.Y.

Compatible with any cassette machine, a new endless loop cassette uses a novel principle of operation—the tape is fed from and taken up by the same hub. The other hub has a spring to keep the unit firmly in place on the machine. Initially, the unit will be available in 3, 6 and 12-minute packages. Applications include self-learning, industrial training, and use as a message repeater.
In our first act we introduced our precision miniature line of snap-action switches. Now comes a beautiful new addition—the sub miniature line.

All we ask is a chance to prove our ability to give you real quality at a competitive price. With old-time service and on-time delivery a part of the deal. We invite comparisons.

For example. The unique design of our sub miniature incorporates a floating contact blade and a low stressed C-spring which provides an overtravel tolerance minimum of .010 inch. Less than half as critical as competition.

And it has a minimum electrical life of 50,000 operations—at rated load.

As you can see, we're making a real play for your next switch order. Sub miniature or miniature. Let your Cutler-Hammer Sales Engineer or Switch Distributor give you our product/service story. He could bring down the curtain on your old supplier.

Our S510KT40 with gold contacts is one of the many stars in our sub miniature line.

16 switches, all U.L. listed. 4 terminal variations (single turret, double turret, pin, and quick connect), 6 industry standard external actuators (leaf, reverse leaf, roller leaf, reverse roller leaf, lever, and roller lever). Gold contacts. Switches in stock for immediate delivery.

INSTRUMENTATION

Portable low-cost DMM checks five functions

Hickok Electrical Instrument Co., 10514 Dupont Ave., Cleveland, Ohio. Phone: (216) 541-8060. P&A: $380 (includes battery and probes); April 1970.

Capable of measuring ac and dc voltages, ac and dc currents and resistances, a new low-cost portable multimeter features a 3-1/2-digit readout. It also includes a built-in battery check.

The model 3300 meter has 100% overrange and auto-polarity and operates from a rechargeable nickel-cadmium battery or 115 or 230 V ac.

DC voltages are measured over 6 ranges from 100 mV to 10 kV with a minimum resolution of 100 µV. Accuracy extends from 0.1% of reading ± 1 digit to 0.5% of full scale.

AC voltages are measured over 6 ranges from 100 mV to 10 kV with a minimum resolution of 100 µV. Accuracy extends from 0.5% to 1% of full scale. AC frequency response covers 22 Hz to 100 kHz.

DC and AC currents are measured in 4 ranges each over 1 mA to 1 A at a minimum resolution of 1 µA.

DC current accuracy is 0.2% of reading ± 1 digit and AC current accuracy ranges from ± 0.5% to ± 1% of full scale.

Resistance measurements range over 100 Ω to 10 MΩ in 7 ranges. Accuracy is 0.3% of full scale. Input resistance is 11 MΩ dc and ac impedance is 10 MΩ and 200 pF.

Digital multimeter stops kickback current

A new 3-1/2-digit multimeter boasts virtually no kickback current, thereby allowing voltage measurements in high-resistance circuits at stated accuracy. Model 8000 also has protective circuitry that prevents damage to the tester when input voltages are as high as 1000 V ac or dc. It has 50% over-ranging, and a sample rate of six times per second.

Digital readout scope offers four channels

E-H Research Laboratories, Inc., 515 11th St., P.O. Box 1289, Oakland, Calif. Phone: (415) 834-3030.

Providing more than 1-GHz bandwidth, a new four-channel four-trace oscilloscope with digital readout allows simultaneous viewing of inputs and OR/NOR outputs from digital ICs or flip-flops. Model 1100 permits time measurements to be made between any two points on one channel's displayed waveform, or between points on any two of the four channels.
Trust your Guardian Angel

for the newest 4PDT—5amp miniature relay

Give us a cubic inch on your printed circuit board ... and we'll fill it with a plug-in relay. The logical relay for logic systems, computers, business machines—any application requiring maximum endurance and reliability in minimum space. Our new 1310, 4PDT-5 amp miniature relay is just a little more than one cubic inch in size, with inductive load contact rating of ¾ hp @ 120V 60 Hz. But the small size doesn't limit its mechanical life of 100 million operations DC, 50 million AC. Minimum!

The miniature size doesn't limit its versatility, either. It's available with a choice of solder lug, quick connect .110, or printed circuit terminals—sockets for "plug-in" installation available with PC or solder lug. Other features like AC and DC versions, the Lexan dust enclosure that's standard, plus U/L and CSA recognition make this relay the answer to an engineer's prayers. (And all this time you didn't really believe you had a Guardian Angel!)

COMPLETE APPLICATION DATA is yours for the asking. Send for Bulletin B5-1.

Talk to your Guardian Angel at the IEEE Show.

INSTRUMENTATION

Three-plug-in scope reaches out to 90 MHz

Chronetics, Inc., 500 Nuber Ave., Mt. Vernon, N.Y. Phone: (914) 699-4400. P&A: $4,000; stock.

The model 1012 is a fully programmable pulse generator that is TTL and DTL-interface compatible. It provides all timing generation, output drivers and all digital manual and remote-control functions. It operates up to 20 MHz in a single or double-pulse mode. Featured are pulse delay, width control, control delay, dc offset and external-triggering capabilities.

Booth No. 2F40 Circle No. 354

Five-digit voltmeter resolves down to 1 µV

Dana Laboratories Inc., 2401 Campus Dr., Irvine, Calif. Phone: (714) 833-1234. Price: from $1,495.

Five series 8000 universal timer-counters can measure frequency to 120 MHz, in addition to period and multiple period average, and can totalize and do frequency scaling. The model 8035 has a 10-ns time-interval resolution and makes frequency measurements to 500 MHz with a 500-µV sensitivity. An eight-digit display is standard on all units.

Booth No. 2H39 Circle No. 285

Pulse generator interfaces TTL/DTL

Systron Donner Corp., 888 Galindo St., Concord, Calif. Phone: (415) 682-1611. Price: $1,295.

Displaying a five-digit readout with 20% overrange capability is a new digital voltmeter with a resolution of 1 µV. The model 7005 digital voltmeter includes a built-in current measuring mode that eliminates the need for external shunts. Adding options to the unit is simplified by the use of plug-in boards which insert into built-in slots on the voltmeter.

Booth No. 2B11 Circle No. 343

Timer-counters resolve 10 ns

Tektronix, Inc., Box 500, Beaverton, Ore. Phone: (503) 644-0161. P&A: $1,775, $900; 2 months.

A new addition to the 7000-series of oscilloscopes is the type 7503 three-plug-in scope with a 90-MHz bandwidth. Its mainframe provides electronic switching between two vertical plug-ins. This allows simultaneous measurement of two waveforms. Another new addition to the 7000 series is the 7B52 time base. It has normal, intensified, delayed and mixed sweep modes.

MORE SWITCH FOR THE MONEY.

NOW YOU CAN SPECIFY PRACTICALLY ANY CUSTOM PUSHBUTTONS ON SWITCHCRAFT'S DW "Multi-Switch®"

There's almost no limit to the variety of pushbuttons you can use on this space-saving, multiple-station pushbutton switch. It has a newly designed "Cross-Rib" actuator located on each module that makes the switch more versatile than ever.

The "Cross-Rib" actuators conform to industry standards and are furnished 3/4" and 3/8" long to accommodate different size pushbuttons. They solve many operator-machine interface problems when used with Switchcraft non-illuminated "Dual," "Showcase," concave or convex face, rectangular, round or square pushbuttons, or the unique "Glo-Button" that achieves simulated illumination.

MORE QUALITY FOR THE MONEY.

In a nutshell, the Series 70000, 71000 DW "Multi-Switch®" is an economical 1 to 18 station switch, that offers up to 4 PDT switching per station; interlock, All-Lock, Non-lock or Push-lock/Push-release functions, plus an almost unlimited variety of electromechanical and electrical accessory options. These switches are adaptations of the Switchcraft Series 65000 DW "Multi-Switch®" switches that are noted for their simplicity, economy and reliability.

SWITCHCRAFT FORUM

Join the SWITCHCRAFT FORUM by sending us a request on your company letterhead. Just give us details on your application, function and the circuitry required. We'll forward a free sample of the Series 70000 DW "Multi-Switch®" plus our "FORUM FACTS on 'Multi-Switch®' SWITCHES" handbook that's loaded with specifications and application information. Your name will also be added to our TECH-TOPICS mailing list. Over 12,000 design engineers find the application stories in this technical publication extremely useful in their work.

ICs & SEMICONDUCTORS

Chip photodiode array contains shift register

Model IPL 20 is a linear configuration of 50 silicon planar photodiodes, which are integrated with a 51-bit shift register on a single monolithic chip. The shift register permits multiplexing of the diode sensors at rates governed by an external clock. The chip measures 0.228 x 0.042 in. and is housed in a 40-lead flatpack with a glass-fronted window lid. Total power consumption is about 100 mW.

Booth No. 3B30 Circle No. 260

Light-emitting diode has limiting resistor

Incorporating its own current-limiting resistor, a new red LED comes in a package measuring only 0.08 inch in diameter and 0.28-inch long. The unit boasts a pitching capability of 0.1 inch, and a current consumption of 4 mA at 6 V. Other versions are available to operate from supply lines of 12 V, and without the internal limiting resistor. Applications include use as circuit and logic status indicators.

Booth No. 3B28 Circle No. 264

Differential op amps deliver 70-mA output

Siemens Corp., 186 Wood Ave. South, Iselin, N.J.

Using directly coupled stages to minimize zero drift, two new integrated differential operational amplifiers can supply output currents as large as 70 mA. Models TAA 861 and TAA 865 can be used as direct-current amplifiers, with and without phase reversal, and with almost any desired gain and any desired input impedance. In addition, their frequency response may be altered via negative feedback.

Booth No. 2H02 Circle No. 259

Monolithic amplifiers swing out to 100 MHz

Intended primarily for use in successive detection logarithmic i-f strips, the SL521A, B and C are bipolar monolithic-integrated circuit wideband amplifiers operating at center frequencies between 10 and 100 MHz. The devices provide amplification, limiting and rectification. They are suitable for direct coupling and incorporate supply-line decoupling.

Booth No. 3F06 Circle No. 293
New - Rotron biscuit blower

...fits inside 1-3/4" rack mounted instruments
...provides high pressure blower performance

Now you can have high pressure centrifugal blower performance in a space never before possible! The new Rotron “biscuit” blower provides useful amounts of high velocity cooling air at a pressure that can force or draw air through tight, electronic packages or directed over hot components. Featuring a minimum depth of only 1-9/16”, the unique construction of the “biscuit” blower enables it to perform reliably, quietly, and continuously for 10 years without any maintenance.

Because the “biscuit” blower is the only commercially available 50/60 Hz air moving device delivering up to 25 cfm of cooling air, capable of being packaged inside 1-3/4” rack panel instruments, significant increase in instrument packaging densities utilizing I.C. technologies are now feasible. Its high static pressure capabilities and its ability to run continuously without air passing through its impeller make the “biscuit” especially suitable for applications where it is desired to hold down paper or film such as office equipments.

The “biscuit” features the same inverted motor construction and resiliently mounted, permanently lubricated sleeve bearing as the famous Muffin Fan. Encapsulated stator construction integrates the electrical portion of the shaded pole motor into the blower housing to provide a monolithic structure impervious to moisture or dust. Three mounting options are provided for easy application and true versatility. Compare the thin profile of the “biscuit” blower with conventional units of similar performance and you can immediately see all the space-saving advantages that are yours.

Tight Tolerance T-H Testing

for labs that are tight with a buck!

Now from Associated—an all-new temperature-humidity test chamber that delivers tight tolerance performance at low, low prices!

Series HH-5100 Temperature-Humidity Chambers feature a new precision instrumentation package, new refrigeration and an improved recirculating humidity system that gives weeks of operation on a gallon of water. Specs? Consider these:

- temperature range -100 to +350°F or -65 to +350°F
- temperature control accuracy ±1°F or better
- humidity range 10 to 98% RH, ±2% or better
- all solid state wet and dry bulb controllers with RFI suppression; dual centigrade and Fahrenheit scales
- two-pen, two-cam programmer, 24-hour recording
- built-in demineralizer with replaceable cartridge

Available with single- or dual-stage cascade refrigeration, in 4, 8 and 27 cubic foot capacities. Write or call for detailed data.

whirlybird tracker

Tracking drones is a job that is made to order for the Vega Model 877S Tracking Antenna System. It is designed to provide passive tracking on the 2.2 to 2.3 GHz telemetry link and also an independent output at 1.75 to 1.85 GHz for television information. Among the functions provided by this system are automatic data acquisition and tracking, sector scan and manual slew. This non-stabilized unit provides tracking information in the azimuth plane. Two narrow beams are used in the azimuth plane and switched at a fixed rate of 60 Hz in order to derive an azimuthal servo error signal. Beam crossover point is 3.0 db down from the peak. Vertical coverage is provided by beam shaping, CSC to 40° above the horizon. This results in good tracking at short range and maximum altitude.

The equipment used to acquire drone information consists of a modified 4' parabola mounted on a radome covered baseplate with drive pedestal located in the lower center. Three supporting legs are equipped with swivel pads for leveling. Remote Indicator Control Box contains all operating elements as well as remote indicator for azimuth bearing information.

Driver Amplifiers available to increase gain

In amplifiers, it is well to turn to C-COR... where amplifiers are the main business. If we can't supply you off-the-shelf, our engineers will design and produce the amplifier you need — and do it fast!

Write or telephone for catalog and technical data on your amplification requirements... or check C-COR Listings in EEM.

MICROWAVES & LASERS

Low-cost rf p-i-n diode distorts to 0.05% max

Type 5082-3080 is a low cost p-i-n diode that can attenuate or switch signals from 1 MHz to 1 GHz at a maximum distortion of 0.05%. Its rf resistance is controlled by the dc forward bias and is linearly variable from 5 to 2500 Ω. Breakdown voltage is greater than 100 V and dc power dissipation extends to 250 mW. It is priced at 99¢ per unit at 10,000 to 25,000 quantities.

Booth No. 1E12 Circle No. 273

Oscillator for X band modulates to 200 MHz

Operating in the frequency range of 8 to 12.4 GHz, a new avalanche diode oscillator displays a linear modulation capability of 200 MHz. The device, model 44014H, is an X-band bias-tuned oscillator operating over its full frequency range with a power output of 5 mW. It is tiny and lightweight, measuring only 3 cubic in.

Booth No. 1F29 Circle No. 363

Precision power meter digitizes its readout

General Microwave Corp., 155 Marine S.t., Farmingdale, N.Y. Phone: (516) 894-3600.

Featuring automatic operation, a new programmable power meter displays its output digitally. The model 471 covers 10 MHz to 40 GHz (when used with the 420 series of power heads). It can measure 10 nW to 3 W in the linear mode, and −39.9 to +35 dBm in the logarithmic mode. Accuracy is 0.5% of reading ±1 count (linear mode) and ±0.1 dB (logarithmic mode).

Booth No. 3K20 Circle No. 272

Fm/a-m modulation set is fully programmable

Covering the carrier frequency range of 2 to 1000 MHz is the model 2301 fm/a-m modulation meter that is fully programmable. It measures full-scale deviation in six ranges from ±1.5 to ±500 kHz for the fm frequency range of 30 Hz to 150 kHz. Up to 90% of modulation depth for a-m measurement is possible at carriers from 2 to 350 MHz.

ELECTRONIC DESIGN 6, March 15, 1970
D/A Converters: Make or buy?

Three things to think about...

1. LOW INITIAL COST — $55

This completely self contained 10 bit D/A converter costs just $55 in 100 quantities and includes DTL/TTL compatible input switches, resistor ladder network, precision reference and output amplifier* with tracking gain resistors... a complete D/A converter in a miniature 0.4"H package for $55 (100 pieces). The DAC 10-H settles the make/buy question once and for all!

*Model MDA 10-H is also available for 300 ns settling times (does not include output amplifier).

2. GUARANTEED PERFORMANCE

You just unpack the DAC 10-H and plug it in. No external trim pots, output amplifier or other components are required... apply ±15V power and your input signals. DAC-10 H is ready to go, with performance tested and guaranteed. No debugging, no trimming, no missed deadlines. Speaking of performance, compare the features with the alternative modular converters in the adjacent chart. DAC-10 H is clearly the Best Buy for all applications where up to 10-bit resolution and accuracy, moderate speed, and input logic flexibility are required.

3. INSTANT AVAILABILITY

Delivery is normally from stock. That means no lost circuit design time, no parts inventory, no manufacturing delays, no production slippages. Evaluation samples are instantly available, too... just contact the applications engineering staff at Analog Devices or your local sales office. Evaluate the DAC-10-H in your circuit against your requirements. Find out for yourself that the new DAC-10 H is the answer!

SPECIFICATIONS

Resolution: 10 bits binary
Accuracy: ±½ LSB (0.05%)
Data Inputs: TTL or DTL Compatible
Output Voltage: ±5V; ±10V
Amplifier Output Current: 5mA
Settling Time: 20 ms (MDA-10H: to 0.5%: 300 ns)
Linearity: ±½ LSB
Temp. Coefficient: ±50 ppm/°C (0° to 70°C)
Power Requirement: ±15V @ 25mA

Comprehensive data sheets with complete specifications and applications information are available. Evaluation samples may also be arranged. Contact Analog Devices or your local sales office.

ANALOG DEVICES

ANALOG DEVICES, INC. • 221 Fifth Street • Cambridge, Massachusetts 02142 • (617) 492-6000

PASTORIZA DIVISION
The Series 2306 NANOPULSER combines extremely fast rise/fall time and large amplitude with other important performance features:

- **REP RATES UP TO 1 MHz**
- **BIPOLAR OUTPUTS**
- **GATING CAPABILITY**
- **SINGLE SHOT OPERATION**
- **LOW JITTER**
- **PRE-TRIGGER PULSE**
- **PROGRAMMING CAPABILITY**

**TYPICAL APPLICATIONS:** Testing semiconductors, IC’s, memory elements, etc.; Reflectometer pulse source for discontinuity testing of long or lossy cables via time domain reflectometry. **PRICE:** From $650

---

**Solid-state system single-sweeps 1210 MHz**

Featuring an output of 1 V rms (+13 dBm), a new solid-state sweeper covers the entire band of 10 to 1220 MHz in one sweep. The model 610B main frame and 61081 plug-in combine to produce an output that is flat to within ±0.3 dB over the entire frequency range. Harmonics and spurious signals are kept down 30 dB below the output. Sweeping is achieved with a slide-rule dial with start and stop controls.

**Booth No. 2D44 Circle No. 261**

---

**Ultra-stable He-Ne laser nears Krypton standard**

Siemans Corp., 186 Wood Ave., South, Iselin, N.J.

A new He-Ne laser provides a frequency stability close to the primary length standard of Krypton 86. By using a Zeeman absorption cell, the LG 65 laser stabilizes at least one power of ten higher than any other comparable laser system. It is fully automatic and is easy to handle. The highly stable frequency is reproducible in only 30 seconds after being switched on.

**Booth No. 2H02 Circle No. 257**

---

**Rf 500-MHz attenuator dissipates 100 watts**

Bird Electronic Corp., 30303 Aurora Rd., Cleveland, Ohio. Phone: (216) 248-1200. **Price:** $165.

Covering the frequency band of dc to 500 MHz is the model 8323 30-dB rf attenuator that dissipates up to 100 W of rf power. It includes several harmonic frequencies of the design fundamental. Maximum frequency deviation is 1/2 dB over the entire frequency band. Corrections to within 0.2 dB are possible at six calibration frequencies and at dc, by the use of a table.

**Booth No. 2E40 Circle No. 352**

---

**ENGINEERS**

- **Evaluation and Test**
- **Manufacturing**
- **Others**

Automatic Electric, a leading innovator of computerized electronic switching systems and the largest producer of communications equipment for the independent telephone industry, has numerous entry level and experienced technical positions available in the following areas:

**EVALUATION & TESTING** Electronic and electrical engineers to initially learn the design of new electronic and computer systems and then perform prototype and/or field evaluation thereon. Entry level requirements — BS degree in EE, ET, or computer science with some knowledge of programming. Higher level positions exist for those with experience in electronic common control systems.

MFG. ENGINEERING Degreed electronic or electrical engineers (new or experienced) initially learn new computerized electronic telephone switching systems, design test equipment and associated test procedures and troubleshoot the mass production of this equipment. Additional Positions currently available include:

- **Component and Circuit Design Engineers**
- **Automation Engineers**
- **Chemical Engineers**
- **Switching System Planning Engineers**
- **Traffic Analyst**

If you are interested in a progressive, growing company that offers well equipped modern facilities, a policy of promotion from within, and a pleasant West suburban location (15 miles from downtown Chicago), send your resume in confidence to:

**VARIABLE CALIBRATED DELAY UNIT**

0 to 60.75ns in 0.25ns increments
Bandpass > 1000 MHz

Series 1200 Delay Units provide discrete values of calibrated delay for applications in RF, pulse and digital systems. Delay steps as small as 0.25ns, continuously variable up to a total of 60.75ns with a built-in 0.3ns vernier. Delay accuracy is better than ±1%. Ideal for use with Series 2306 NANOPULSERS to provide calibrated pulse widths. Both manual and remotely programmable models available. **PRICE:** From $340

low cost timer...

SEALECTRO TIMER

- For Process Control
- Instrumentation
- Control Timing
- Photocopying Machines
- Vending Machines
- Displays
- Automated Broadcasting

Here's the answer to those many timer and programming problems. A revolutionary combination of field programming capability, 100% repeatability and either ON/OFF or cam switching in one low cost package. No loose parts. No critical cam adjustments. The LCT Sealectro Timer.

A precisely machined 60 position programming drum with sliding contact actuators, driven by a 1 RPM other speeds available) Synchronous motor is the heart of the Sealectro Timer. Each actuator corresponds to a 1 second time interval allowing any ON/OFF or camming functions to be set up in increments of 1 through 60 seconds. A built in drum position indicator assures 100% repeatability. Contacts (one and two contact models are available) are rated at 15A., 115 VAC resistive and 15A., 115 VAC inductive.

If your control or timing system requires an inexpensive program or time base generator, the LCT Sealectro Timer is the answer.

Write for complete technical details.
HUDSON

is never out-drawn...

nor out-stamped . . .
nor out-assembled!!!

We are actually quite friendly, but get mighty tough when it comes to beating all challengers "to the draw".

See us at the IEEE Show, Booths ID07-ID11, for samples of the many thousands we have already "covered". We think they'll trigger a reaction.

HUDSON TOOL & DIE CO., INC.
Enclosures-Stampings-Assemblies
18 MALVERN STREET
NEWARK, NEW JERSEY 07105
WHY SHOULD YOU SPECIFY MECATORN SPUN REFLECTORS?

The exclusive Torngren Mecatorn® hydraulically controlled spinning process has produced thousands of spun-to-specification "dishes" in use today by both military and commercial communication networks — at substantial savings over other more costly fabricating methods.

If you have a requirement for parabolic reflectors from 4 inches to 16 feet in diameter call Torngren today for complete details on the cost saving and metallurgical advantages of the Mecatorn® process.

-terminal blocks get disconnect tabs

Quick-disconnect tab terminals are now included on a line of fully insulated feed-through terminal blocks. The tin-plated tab terminals, which come in two sizes (0.032 × 0.25 in. or 0.032 × 0.187 in.), are available in six styles: single or double-sided versions of horizontal, vertical, or 45-degree configurations. The terminal blocks provide up to 26 poles.

Booth No. 4E11 Circle No. 270

DIP IC sockets include ejector

A new series of dual-in-line sockets provides from 8 to 50 contacts for IC devices. The 16-pin receptacle has an integral ejector key that simplifies the removal of the integrated circuit. The larger DIP sockets, namely the 24, 28, 36, 40 and 50-contact devices, accommodate most LSI packages and are available in two forms: one for test purposes and the other for production use.

Information Retrieval Number 135
Singer has advanced the state-of-the-art with a signal generator so new it almost requires a new name. The Model SG-1000 obsolets every other signal generator within its frequency range... singly or in combination. Its performance is so superior that no other instrument available can equal or even approach it. That's why we call it the Innovator.

Here's why you'll call it unbelievable...

- Digital readout of frequency.
- Exceptional frequency accuracy and resolution... typically 0.005%... and no human readout errors.
- Full modulation capability AM □ FM □ Pulse □ Video □ Internal 1,000Hz modulation □... and combinations of the above.
- Output levels from +20dBm to -146dBm.
- An automatically leveled output... within ±0.5dB over the entire frequency range.
- Use it as a 2MHz counter for counting modulating signals or rep rates directly.
- A spectrally pure output signal approaching that of a crystal... extremely low residual and incidental FM.
- Total elimination of dial tracking errors.
- The availability of BCD frequency output and a programmable attenuator to assure system integration.

This is only part of the SG-1000 story. A more complete technical description is available in Singer Application/Data Bulletin SG-10 upon request.

For additional information contact your local Singer Representative, or write or call —

The Singer Company Instrumentation Division 915 Pembroke Street Bridgeport, Conn. 06608. 203-366-3201.

SINGER INSTRUMENTATION
'Made in Japan'
— today it's a sign of quality

By Howard Bierman, Editor

Japan's electronics sales rocket to new heights  .......... U162
ICs play a heavy role in Japanese success  .......... U164
Money isn't everything to a Japanese engineer  .......... U174
Japan’s electronic sales

Up, up and away is not the slogan of Japan Air Lines — but it certainly could be that of the Japanese electronics industry. Climbing at the dizzying rate of a 44% increase in factory sales in 1969 after a dramatic 32% rise in 1968, the quality-conscious producers of components and consumer and industrial products are reaching for the sky. Factory sales soared to a total of $7.5-billion in 1969, compared with $5.25-billion in 1968. Exports rose from $1.4-billion in 1968 to close to $2-billion last year — up more than 40%. These statistics were released recently by the Japan Electronic Industry Development Association and the EIA of Japan.

Consumer products were responsible for 46% of last year’s factory sales as they rose from $2.3-billion to almost $3.5-billion. An overwhelming demand for color TV sets, as well as for compact black-and-white portables, helped account for these significant gains. Factory sales of industrial electronics, including desk-top calculators and computers, rose 27% — up from $1.6-billion to more than $2-billion. Components to support these record productions and for replacement gained 53%, surging to $2-billion in 1969 from $1.4-billion the year before.

The total electronics market for 1969, therefore, was dominated by consumer electronics production, followed by both industrial equipment and components (each approximately 27% of the total). There is no significant military or space budget in Japan to support research and development.

Consumer production soars

Of the almost $3.5-billion in consumer products produced in 1969, sales of TV sets increased more than 53% — from $1.27-billion to $1.94-billion. Audio equipment — stereo receivers, phonographs, etc. — scored a spectacular rise of more than 63% as they reached $1.08-billion in factory sales last year, compared with $660-million in 1968. Radios, with considerable competition from Hong Kong and Taiwan manufacturers, gained 26%, moving from $370-million in 1968 to $465-million. Calculators and instruments gain

Of the $2-billion in industrial electronics production, desk-top calculator output more than doubled, hitting $148-million in 1969, compared with $71-million in ’68. Test-instrument production rose more than 31%—from $226-million to $294-million.

Expansion of fm and uhf TV stations was responsible for a 53.5% increase in broadcasting equipment production — to $63.6-million from $41.6-million in 1968. The entire communications segment of the industrial market scored a 22.5% gain, rising from $730-million to more than $900-million. Computer production rose to $535-million, against $455-million in 1968, an 18% gain. A major rise in computer sales is forecast for the 70s as a myriad of minicomputers roll off assembly lines.

ICs lead rise in components

Total component production rose 52.6% last year, totaling $2-billion. Tubes and semiconductor devices showed a 40.4% boost, reaching $827-million in sales, CRTs rose 53% with a $342-million output to supply the burgeoning TV market, and resistors and capacitor sales rose 50.3% and 44%, respectively, with totals of $161-million and $268-million.

Integrated-circuit production, not detailed by the Japan Electronic Industry Development Association, was estimated to have tripled to $72-million in 1969. This figure is expected to soar to over $190-million this year and to over $390-million in 1971, according to a recent survey of eight IC manufacturers. These dramatic production gains are necessary to supply the heavy demands projected
for bipolar and MOS devices for the booming consumer and calculator-mini-computer markets. The survey also reveals that more than 43% of the '69 output of ICs was used for in-house production of desk-top calculators and computers by the systems divisions of eight major IC firms. The remaining 57% was made available to the open market.

The eight IC suppliers estimate that close to 60% of their production was used in desk-top calculators in 1969, while 23% ended up in computers. Only 17% of the '69 production of ICs was used in consumer products, test equipment and industrial equipment other than calculators and computers.

In 1971, the IC companies estimate, calculators and computers will require less than 60% of the total IC output, and the remainder will go to the consumer and industrial markets.

The heavy use of MOS in desk-top calculators resulted in an estimated 50:50 ratio between bipolar and MOS production dollars. MOS/LSI for desk-top calculators accounted for close to $9-million production in 1969, with a substantial increase expected this year.

Exports spiral to new highs

Total Japanese exports of electronics increased by a substantial 40.8% to a fraction under $2-billion from the 1968 level of $1.4-billion. The export gain for consumer products was 40%; it accounted for over $1.3-billion in sales alone (TV sets and radios were responsible for $360-million and $500-million, respectively). Tape recorders, with cassette types receiving wide acceptance, rose more than 44% in export sales—$330-million, against $228-million in 1968.

Industrial electronic exports increased to $268-million, compared with $183-million in '68—a 46% gain. Computer exports more than doubled, rising from $51-million to $103-million. Test-equipment exports rose 20.6%—from $32-million to about $39-million.

Component exports were up 41%, with capacitors showing a gain of 59% (to $54-million), semiconductors rising 45% (to $27-million), resistors increasing 45% (to $17.5-million) and electron tubes up 20% (to $48-million).
ICs play a heavy role in Japanese success

Power ICs, semiconductors, minicomputers and new consumer products are the pacesetters of the Japanese electronic industry this year.

High-power ICs, reaching the 50-W level for hybrids and 20 W for monolithics, are finding their way into such booming consumer areas as TV sets and stereo systems. Low-noise microwave transistors, made by ion-implantation techniques, are leading the way to more compact communication equipment.

Low-cost minicomputers and desk-top calculators are offering an attractive substitute to the more complex and costly time-sharing installations previously planned for numerous test and process-control applications. And finally, electronic wristwatches and microwave ovens are growing contenders for the consumer's dollars.

High-power packages, both monolithic and hybrid designs, have been developed and are in production for such consumer products as stereophonic amplifiers and receivers, tape recorders, public-address systems and deflection sections of TV sets.

Top power output honors go to Sanken Electric Co., Ltd., of Tokyo for its 25 and 50-W hybrid units. Six transistors and one diode are used, with a single-ended push-pull design in the output stage. Two npn diffused-junction power transistors, with high secondary breakdown resistance characteristics are used in the output stage and are reported to be capable of withstanding a short-circuited output (at full rating) for five seconds without damage. All necessary electrolyte capacitors and resistors, except a single coupling capacitor to the speaker, are contained in an assembly measuring approximately 3 x 1 3/4 x 3/4 inches.

The 50-W unit sells for $15 in quantities of less than 100 and for $10 in quantities of more than 50,000. The 25-W type costs $10 in small quantities and $7 in mass quantities.

Toshiba (Tokyo Shibaura Electric Co., Ltd.) has introduced a 20-W hybrid IC that uses a pnp differential input circuit to minimize the effects of temperature and line voltage fluctuations. The output transformerless design uses seven transistors and requires three external capacitors. The voltage gain is 31.5 dB.

Another supplier of hybrid ICs is Sanyo Electric of Tokyo, which introduced the first high-power hybrid IC (15 W) in Japan two years ago. Its type STK-003 contains seven transistors, including a complementary pair of power transistors. A total of eight external capacitors and resistors are needed to complete the circuitry. With a 40-V supply, a maximum output of 15 W (at 1% distortion) can be achieved. Sanyo also produces a 10-W unit, the STK-015, for 32-V operation and a 5-W unit, STK-011, for 25-V operation.

Undaunted by the prediction of semiconductor engineers that monolithic ICs would remain at 5 W until a significant breakthrough in monolithic fabrication extended the limit to 10 W, Sony Corporation's Research Center in Yokohama has produced a 20-W continuous rms power rating with a single-ended, push-pull configuration. This IC development overshadows the 3-W and 5-W monolithic devices available from other U.S. and Japanese manufacturers.

Three key factors influence the design of a high-power IC. First, breakdown voltage must be high to permit use of a reasonably high supply voltage. Second, collector series resistance must be low to minimize power loss due to high collector current flow. And third, the device must exhibit stable operating characteristics, despite temperature variations caused by the heat generated within the small chip area. Sony's new fabrication technique involves a unique epitaxial process to control selectively the growth of a fine polycrystalline structure and a single crystal on the same substrate. A special process, taking advantage of the difference in diffusion velocities in the single and polycrystalline structures, controls the concentration of impurities during IC fabrication. The polycrystalline structure permits a low resistance connecting lead to be fabricated from the buried collector layer to the surface contact, and it also

acts as an efficient diffusion canal for the dopant to reach the single crystal regions to form isolation junctions. The process allows npn and pnp transistors of similar vertical structure (nonlateral) to be made on a single substrate with low saturation resistance, high breakdown voltage and stable characteristics, despite temperature variations.

Although the fabrication steps may appear complex, Dr. Shigeo Shima, director of Sony's research center, says the process is highly controllable and high yields are not at all difficult to attain. The initial application for these devices, according to Dr. Shima, will be in the vertical deflection section of Sony TV receivers. Later applications will involve stereo equipment and tape recorders.

A 3-W monolithic IC is being offered by Mitsubishi Electric Corp., Itami City, for lower-voltage (12 V) equipment in cars and boats or portable battery applications. A total of 13 transistors, including three lateral pnp types, are included within the chip, and eight external components are needed. For 3-W output across a 4-ohm load, 50 mV is required for full output. Nippon Electric Co., Tokyo, is also producing a 3-W monolithic amplifier, the µPC21C, in a 14-lead plastic, dual-in line package.

**ICs for color TV applications**

Consumer product manufacturers in Japan are like their counterparts in the U.S. when it comes to tight security concerning new product announcements. But the pace to introduce ICs into consumer products appears more pressing in Japan, where there is both a tightening labor market and a major effort among leading producers to raise their output substantially. By 1973, the leading producers of consumer electronic products expect to double their sales and to add only 10-20% more production help to achieve this. Since wages are on the rise and at the same time increased profits are constantly being sought, the importance of IC applications become apparent.

Several manufacturers, including Sanyo and Matsushita Electric Industrial Co. of Osaka, introduced compact IC monochrome TV sets over a year ago. The Matsushita (Panasonic) pocket-size receiver uses eight thick-film hybrid ICs, rather than monolithic types, to approximate conventional circuit design, which uses discrete components. The eight hybrid IC packages provide the following functions: (1) Sound i-f amplifier and discriminator; (2) Audio and age; (3) Video i-f amplifiers; (4) Video detector and amplifier; (5) Sync separator and afc; (6) Vertical deflection; (7) Horizontal deflection, and (8) Power-supply filtering. A separate tuner subassembly, using variable capacitance diodes, a flyback transformer and high-voltage rectifier, and a miniature, specially developed 1.5-inch CRT complete the battery-operated set. Four AA nickel-cadmium batteries are reported to give two hours of viewing time. The recharge time is three hours for the 1.5-pound portable, which draws only 1.2 W.

The use of ICs reduces the 280 soldering points needed for a conventional TV receiver design to about 70 in this portable set — a considerable saving in assembly time and cost.

**Joint effort pressed with ICs**

The use of ICs to reduce cost and improve reliability in color TV receiver design is a major team effort in Japan. Five TV manufacturers, seven component producers, four universities and two institutes in the Osaka area have organized the Kansai Electronic Industry Development Center to develop jointly such a color TV receiver.

A prototype set was recently developed using thin-film, thick-film and monolithic ICs. The circuits not considered for IC implementation were the uhf tuner, video output, horizontal and vertical outputs, high voltage rectifier and power supply. The vhf tuner uses a thin-film hybrid IC for the rf amplifier, and over-all gain is 15 dB for the lower channels and 12 dB for the higher channels. A monolithic IC performs the oscillator mixer function and provides 22 dB gain for the low channels and 16 dB for the high channels.

Monolithic ICs are employed for the chroma bandpass amplifier and chroma demodulators; a thick-film hybrid IC is used for the matrix preamplifier. A monolithic IC burst amplifier is biased by a thin-film color killer stage. The 3.58-MHz oscillator and amplifier function is performed by a monolithic IC with a thick-film hybrid assembly as the reactance transistor stage. Both thick and thin-film techniques are used to fabricate the color...
Eight thick-film ICs and a 1.5-inch CRT are features of this Matsushita portable.

Phase detector circuit. A 3-W audio monolithic IC amplifier is used to drive a 4-ohm speaker with 50% efficiency from a 50-mV detector signal. A multi-purpose monolithic differential amplifier with R-C feedback is used in the vertical oscillator, and another similar type is used in the horizontal oscillator section.

Watches and microwave ovens produced

New areas for the application of electronics to consumer products are watches and microwave ovens. Several months ago a quartz-crystal wristwatch, with an accuracy within five seconds a month, was announced by Seiko Watch-K. Hattori & Co., Japan's leading watch manufacturer.

The quartz crystal assembly consists of a 8.192-Hz oscillator, an IC divider to reduce the signal to one pulse a second, an electromechanical transducer to convert these second signals into mechanical rotary movement, a counting mechanism to move the second hand in one-second intervals, and a battery to operate the electronics and step motor continuously for one year.

Microwave ovens that are large enough to handle a chicken but compact enough to be placed on a small table are enjoying overwhelming consumer acceptance in Japan today. More than 250,000 microwave ovens were produced in 1969, according to industry sources, compared with 50,000 the previous year. Manufacturers such as Matsushita and Sharp Corp., Osaka, are reported planning on production of 750,000 ovens this year. Domestic demand is expected to peak during the year, and exports are expected to reach the U.S. market.

According to a Sharp spokesman, the company's microwave ovens have already passed the safety requirement levels for the United States Public Health Service, the Federal Communications Commission and Underwriters Laboratories. The U.S. radiation level requirement, according to the spokesman, is 10 mW/sq. cm., while Japan's is 0.3 to 0.5 mW/sq. cm. — a tolerance that is met by all Japanese microwave oven manufacturers. The popular ovens for the home deliver 600 W and are not much larger than a king-size rotisserie. The cooking time with such ovens is reduced to one-eighth to one-twelfth the time that conventional gas ovens take. Retail prices in Japan have dropped below $300.

On display at IEEE Show

Some of the outstanding achievements of the Japanese electronics industry are on display at the New York IEEE show. For example, the strenuous efforts of Japan's semiconductor firms to supply their domestic consumer and industrial customers are evident.

At the IEEE show, Mitsubishi (Booth 4G17) is exhibiting an extensive line of linear ICs for the consumer market. Stereo demodulators, 1-W and 3-W amplifiers, op amps, voltage regulators, differential voltage comparators and a 300-mW a-m radio chip are just a few of the items in its product line.

Nippon Electric Co. (Booth 3B01) is in pilot production with a 144-bit n-channel MOS-LSI memory having a cycle time of 80 ns. Also in production is a single 64-bit dynamic shift register (μPD108C) and a dual 64-bit dynamic shift register (μPD109C); both MOS units are geared for the desk-top calculator market. Nippon is also producing a line of linear ICs for nonochrome and color receivers including its μPC24C for combined service as video amplifier, sync separator, noise suppressor and agc keyer.

A line of MOS ICs and LSI devices is being shown by Toshiba (Booth 3B22). In addition to the 4-bit static shift register, 48, 60 and 64-bit dynamic register, as well as a 36-pin ceramic dual
Metal film attenuators, variable and fixed, with long-term temperature stability, are being offered by Teikoku Tsushin Kogyo, Tokyo.

In-line timing pulse generator (T 3019) for generating 27 different control pulses, are on exhibit. Toshiba is also demonstrating a high-speed IC tester, series 1200, capable of testing 100 ICs a second.

Transistor and diodes shown

High-voltage silicon power transistors for the audio, video and deflection output stages of TV receivers are being shown by Matsushita (Booth 4J11). The type 3SK36 high-frequency MOS transistor includes two protection diodes integrated into the MOS gates.

Sharp Electronics (Booth 4G16) will be showing its GaAs negative-resistance, infrared light-emitting diodes, developed by the company’s Optoelectronics Research Group. The four-layer GND device, discovered by Sharp engineers as production process changes were being investigated, provides a fast-acting switching action and produces light output that is reportedly 50% greater than that of conventional light-emitting diodes. The applications under investigation include amplifiers, logic circuits, optical memory systems, d/a and a/d converters, pattern recognition and optical communications.

In addition, Toshiba is exhibiting its highly publicized silicon low-noise IBT transistors. Designed primarily for low-noise microwave amplifier use, the npn S1072 device offers a 3-dB (typical) noise figure at 2 GHz with 8-dB power gain; at 4 GHz, the noise figure is only 5 dB (typical). Although no definite price figure has been announced, the device is expected to sell for about $100; production plans will be based on the demand stemming from sample deliveries made before mid-year.

Nippon Electric has developed a 3.4-to-4.4-GHz transistor amplifier with 7-dBm output power, using its V417 transistors. Unit amplifiers of the same design are connected in cascade by short transmission lines. The circuit is fabricated on alumina substrates and isolators are integrated in the input and output parts of the amplifier. The noise figure is 10 dB, and the input and output VSWR is 1.2 maximum.

The company has also developed a 4-GHz Schottky barrier diode mixer-preamplifier, using its SM153 diode. In this mixer, the image frequency is terminated reactively. Thin-film fabrication techniques are used to deposit the circuits on ceramic and glass substrates.

A line of miniature isolators and circulators is being exhibited by Mitsubishi.

A tunable filter, extending 200 MHz on either side of 1 GHz is exhibited by TDK Electronics Co., Tokyo (Booth 4C04). The insertion loss is 4 dB, and the bandwidth is 20 MHz for the YA11G device. TDK is also showing a compact broadband stripline circulator for C-band operation.

5000-MHz scope leads instrument gains

Measurement and test equipment in Japan, including process-control instrumentation, is being manufactured by close to 250 companies. Slightly less than 100 concerns, producing about 90% of the industry volume, belong to the Japan Electric Measuring Instruments Manufacturers Association, according to the group’s director, Tsuneji Asami. About $360-million in factory sales were estimated for the total measurement market in 1969, Asami reports, against less than $300-million the year before; electronic test instruments account for about 30% of these totals. Growth at a 20% annual rate is expected to continue through
Amazing. This new Hitachi LED numeric readout is smaller than a pen point. But, you can use it to display numerical figures zero to nine. Brilliantly. On low voltage. Even on dry batteries. In whatever item you have that requires Light Emitting Diodes. All because Hitachi was technically successful in producing large crystals of gallium arsenide phosphide and a new monolithic integrated structure. See how it works yourself. Come to the '70 IEEE Show at the New York Coliseum, March 23 to 26. Look for Hitachi booth numbers 3K30—3K35. Jot them down now. Better yet, tear out this page and take it with you to the Show.

Voltage: Operable on 1.76 volts
Current: 50 mA per numerical digit
Power Consumption: 85 mW per digit

Spectral Wavelength: 6,300A to 6,800A (red)
Responsive Speed: One nanosecond (one billionth of a second)
Brightness: More than 120 feet Lambert

See these important developments, too! Ferroelectric-Ferroelastic Crystals / TGS Detectors / MOS LSI / 16 MIL Memory Cores / Scanning Type Electron Microscopes / Laser Ray Tubes / Sound Spectrogram Color Indicators / Millimeter Wave Test Equipment (Gun-Diode) / 110 Polarization TV Tube and TV Sets
1970. Of the $360-million total production, only 20 to 25% is exported, Asami explains, since Japanese companies have not resolved the problem of setting up competent, economical service and calibration stations throughout the world. Drastic changes in instrumentation design are common in the U.S., Asami notes further, due to NASA's funding for sophisticated equipment; Japan's industry has no such backing and, as a result, its technical growth in this area is slower and more deliberate.

However, companies such as Iwatsu Electric Co., Tokyo, and Matsushita Communication Industrial Co., Ltd., offer oscilloscopes with 200 and 300-MHz bandwidths. Plug-in counters extending to 12.5 GHz, multi-function digital voltmeters and sophisticated data-acquisition systems are being supplied by Takeda Riken Industry Co., Ltd. These are but a few of the concerns supplying the necessary test hardware for the fast-growing consumer

From dc to 5,000 MHz is the range of this Matsushita Nanoscope, which uses a traveling-wave CRT.

and industrial manufacturers in Japan.

A 5000-MHz, real-time oscilloscope has just been announced by Matsushita for observation of non-recurrent, single-transient waveforms. The instrument, called a Nanoscope, relies on a specially designed traveling-wave CRT with a vertical deflection system made of a coaxial, helical-strip slow-wave structure.

Dominant role due for computers

Computers are expected to play a substantial role in continuing Japan's electric industry growth. The 18% increase in computer factory sales between 1968 and 1969 is only a beginning, industry experts predict. The powerful Ministry of International Trade and Industry has recently announced a priority goal to close the U.S.-Japan computer gap by 1980. Not much more than 10 years ago the first computer installation was placed in operation in Japan. By mid-1969, close to 5000 installations were operating, compared with about 50,000 in the U.S. To accomplish their goal, Japanese computer companies will have to maintain a steady 30% increase each year for the next decade.

Six major computer manufacturers — Nippon Electric Co., Hitachi Ltd, Fujitsu, Toshiba, Oki Electric and Mitsubishi — have been organized to provide equipment sales and rentals through a jointly owned Japan Electronic Computer Co.

Minicomputers growing in number

Much of the effort is directed to the small and minicomputer product lines, which offer considerable potential for export sales. Among the growing number of minicomputer models are Hitachi's HITAC-10, Matsushita's MACC-7/s, Nippon Electric Co.'s NEAC-M14, Oki Electric's OKITAC-4300 and Fujitsu's FACOM-R.

A superfast 300-ns magnetic core memory, using 12 mil cores, is being exhibited by TDK Electronics. The basic memory capacity of the 2½ D system is 2k words of 8 bits plus parity. The size of this memory, approximately 4 x 25 x 15 inches, is claimed to be one-fifth the size of the commonly used four-wire, 3 D system (which uses 20 mil cores), and with the same memory capacity.

Desk-top calculators on the rise

Desk-top calculator factory sales more than doubled last year, from $71-million in 1968 to $148-million. Sharp Corp., reportedly supplying 23% of the world market and 40% of Japan's output, is preparing its next generation of desk-top machines. Dr. Tadashi Sasaki, director of Sharp's Industrial Instrument div., foresees a pocket-size machine with a built-in electronic printer.

For display, Sharp is working on special mechanical devices that require low power consumption, as well as miniature micropower multicharacter, in-line tubes. Also under consideration, according to Dr. Sasaki, are gallium arsenide phosphate solid-state numerical displays. Developments in keyboard design include work on Hall-effect devices, Sharp's patented GND negative-resistance Ga As units and miniature reed relays. In a limited keyboard space, an operator may accidentally depress two keys at the same time; an electromechanical assembly permits the system to ignore the second key that was depressed. The next-generation calculator will have this function served by LSI shift registers, Dr. Sasaki suggests.

To further reduce calculator size, Dr. Sasaki indicates that PC manufacturers are being asked to produce low-cost, highly accurate through-hole boards that will have less than 1.6 mil spacing with less than 0.8 mil line width for conductors.
High quality capacitors unrivalled in the precision, dependability and compactness. Quality is recognized by ever wider use in measurement equipment, computers, and automatic controllers. "LEAF" the matter of capacitors to MATSUO ELECTRIC CO.

**SOLID TANTALUM CAPACITORS**

FOR HYBRID ICs - "MICROCAP" -

**Specifications:**
- Operating Temperature Range: $-55°C$ to $+85°C$
- Standard Voltage Rating: $6.3, 10, 16, 20, 25, 35$ VDC
- Standard Capacitance Value: $0.01$ to $22$ MFD (E6 series)
- Standard Capacitance Tolerance: ±20% (M)

MATSUO'S other capacitors include:
- Metallized Polyester Film Capacitor: Type FNX-H mylar wrapped.
- Solid Tantalum Capacitors: Type TAX hermetically sealed in metallic case, Type TSX encased in metallic case and sealed with epoxy resin, Type TSL encased in metallic case and sealed with epoxy resin. Polyester Film Capacitors: Type MFL epoxy dipped, Type MFK epoxy dipped, non inductive, Type MXT encased in plastic tube, non inductive.

 Versatile COSMICAR® lenses meet all your purposes

COSMICAR lenses, widely reputed as superlative in reproduction and microfilming applications, are also available for 16mm cine and CCTV cameras.

Please write for further detail to:

COSMICAR OPTICAL CO., LTD.

Cable Address: "MOVIEKINO TOKYO"
This seven-segment, solid-state GaAsP array by Hitachi requires only 85 mW per digit.

Sharp is actively engaged in designs to reduce the input power demands to less than 800 mW.

When will this pocket-size, battery-powered, eight-digit prototype be ready for marketing and test evaluation? By the end of 1971, Dr. Sasaki believes.

Future of display tubes is bright

Considerable development effort is underway at tube and calculator companies toward smaller, brighter, lower-power-consuming display devices. Prototypes have been announced for solid-state alphanumerical displays and for multi-digit discharge tubes.

Hitachi has announced a seven-segment, GaAsP light-emitting diode array, capable of displaying numerical characters that are less than a half inch high. The device operates at 1.75 V with average current at about 50 mA per digit, for an average input per digit of only 85 mW. The spectral wavelength is in the 6300 to 6800 A region, and brightness is said to be more than 120 feet lamberts. At present, no price or availability figures are available.

Multi-digit discharge tubes have already been announced by Philips of the Netherlands, Matsushita and Ise International Corp., Tokyo. A new entrant into the field is Nippon Electric with its LD8008 eight-digit and 8D5005 12-digit development devices.

A low-voltage, low-current incandescent subminiature indicator tube is being prepared for the calculator market by Apollo Corp., Tokyo. Labeled the Atron, the tube is reported capable of brightness levels of 5,000 foot-lamberts (maximum) compared with the 200-foot-lambert levels of competitive fluorescent and glow-discharge types.

Digital display tubes, with character sizes ranging from 8.5 to 19 mm and bulb diameter from 10 to 32 mm, are available from Okaya Electric Industries Co., Tokyo. The display is formed by mosaic combinations of filaments, which result in low-cost assembly, the company reports.

Still another entry in the display tube field is Oshino Electric Lamp Works of Tokyo, reportedly the top producer of subminiature indicator lamps in Japan. According to Hiroshi Oshino, the company's export manager, it will have seven-segment numerical readout tubes ready before mid-year.

To illustrate the pressing pace of display-tube companies, Keiji Aoyago, president of Ise, says his company plans to raise output from the 1969 total of 300,000 units to 4 million this year and 8 million by 1971. Solid-state display devices don't worry Aoyagi right now; he believes they will need more than two years to become price-competitive and will find it difficult to compete on the basis of their small character size.

Planning to visit Japan for Expo '70 this year? Combine business with pleasure by planning your trip between April 10 and 20, the dates of the Japan Electronics Show. More than 300,000 visitors are expected to pass to view the 1500 booths of 350 exhibitors. The show is being held in Tokyo at the Harumi International Trade Fair Grounds. Last year's show at Osaka attracted 160,000. Each year the show alternates between Tokyo and Osaka, in the same manner as the annual Los Angeles-San Francisco Wescon exchange.

Eight digits in one readout tube. Nippon Electric is also demonstrating a 12-digit model.

A compact, high speed memory, using 12-mil cores, has been fabricated by TDK Electronics.
Soshin's One Finger Speciality Mica Capacitors

The only mica capacitors to pass evaluation testing by Japanese Government equivalent to MIL-C-5D
Money isn’t everything to a Japanese engineer

Kiyokatsu Negishi, on the way up 17 years after graduating from a Japanese engineering school.

“Wages have been skyrocketing each year. Now, for instance, the average eight-year senior high school graduate can earn as much as $77 to $85 per month as base salary!”

That’s not a typographical error. That’s a comment from a recent editorial in a Japanese technical publication, Japan Electronic Engineering. Wages in Japan, even for engineers with college degrees, are only a fraction of what they are in the United States. But there are fringe benefits for the security-minded — such as a job for life, without fear of layoffs.

To the typical American engineer, it might seem paternalistic. To the Japanese engineer, the system offers peace of mind and opportunity to advance.

Kiyokatsu Negishi is in charge of the design of industrial measurement equipment at Rikadenki Kogyo Co., Ltd., Tokyo, a concern engaged in the development and manufacture of multi-pen and computing recorders. It took him 15 years to reach this department head level. After joining the company 17 years ago upon graduation from a senior engineering high school, Negishi spent 10 years as an engineer until he was promoted to section chief. Five years later, he was given his present responsibility.

Negishi is married, has two daughters, 4-years old and six months, and is one of the few engineers in Japan who own a home rather than rent an apartment. He recently bought a home near Yokohama, about 26 miles from the plant. He commutes by train.

Negishi’s plant works on an 8:30-4:30 schedule from Monday to Friday, with three-quarters of an hour for lunch each day. In addition the regular schedule includes work on Saturday from 8:30 to 12:30 every other week, except during the months of July and August when employees are expected to work every Saturday for this half-day period.

Overtime during the week draws a 20 per cent bonus after 4:30 p.m. and a 25 per cent bonus after 10 p.m. The average overtime is about 25 hours a month.

Last year Negishi earned approximately 1,800,000 yen or $5000 (360 yen = $1). Two-thirds of this sum came from salary and overtime, and the remaining third from the company’s bonus program.

Layoffs are a rarity

Don’t rush to any conclusions. Salary isn’t the most significant factor to a Japanese engineer, according to Rikadenki’s Yozo Yasunaga, managing director of Negishi’s top engineering boss. First, Yasunaga points out, there is a glaring contrast between a company’s responsibility to an employee in Japan and the comparable relationship in the United States.

Both U.S. and Japanese companies use a 90-day trial period to allow the engineer and employee to evaluate each other. If either party feels a wrong decision was made at this early stage and that long-range compatibility is not likely, parting is amiable and no harm to company or career growth has resulted.

After the 90-day period, if both parties are satisfied in a U.S. company, the employee continues to
**TOYOCOM COMLINE® INTEGRATED CRYSTAL FILTERS**

- The only standard line of integrated 10.7 MHz and 21.4 MHz crystal filters on the market. These tandem monolithic integrated crystal filters use no inductors or transformers. Don't use an old-fashioned filter in your equipment designs. Take advantage of the reduced cost, small size and improved performance available only with a tandem monolithic integrated crystal filter.

- The smallest standard model 10.7 and 21.4 MHz crystal filters on the market. Upright mount or flatpack. Our flatpack 10.7 MHz filters are only 0.20 inches high.

**INFORMATION RETRIEVAL NUMBER 145**

**ELFIN T.M. NEON INDICATORS**

1. Single Plane
2. Brighter Display
3. Wide Viewing Angle
4. Smallest in Size
5. Low Power Consumption

**Mitsubishi at the Coliseum**

The '70 IEEE Show is the time. Booth 4G17, New York Coliseum is the place. And this year Mitsubishi is proud to show the newest results of our research and advanced techniques—Miniature Coaxial Circulators; VHF, UHF, SHF. We urge your special attention to our 700 MHz type. We expect this built-in model to have a big impact on the IC field, making much smaller communication equipment possible. We are also showing miniaturized broad-band S-band circulators, and monolithic ICs—both digital and linear.
work as long as he is content—provided there is no budget slash or abrupt termination of a project he is involved with. When contracts become tight and budgets are trimmed, engineers may be thrown into a panic in this country, as they await news of who is to be axed until new contracts are won. Or, in times of stability, the American engineer may receive an offer for a more attractive salary from another company; he may resign after due consideration and start anew elsewhere.

It doesn’t work that way in Japan. A Japanese employer, Yasunaga explains, enters into a lifelong contract with an employee once the 90-day trial period is over. The employee is expected to remain with the company until retirement age—in most companies, 55 years old for men, 50 for women, though Rikadenki has raised its retirement age for men to 57 because of the increasing labor shortage.

Layoffs, Yasunaga says, are just about nonexistent for permanent Japanese employees (some part-time employees are hired but with full understanding that they join the company for temporary work only). Should a company reach the point where layoffs are necessary—and it happens from time to time—the concern faces considerable disgrace, and the executives responsible for allowing this situation to occur are often replaced. So job security does not gnaw at the Japanese engineer.

What about the engineer who is lazy? Or unhappy? Or incompetent? He is not fired, Yasunaga explains. He is urged to change his work pattern, to study and so update his technical abilities, and to alter his attitude. If he fails to respond, he will be kept at his present position, performing his same tasks with no promotion or significant salary change. He will be fired only if he becomes physically abusive or commits a crime. The problem of the rebellious employee doesn’t often come up, because employees know that if they are discharged by a company, their chances for securing work elsewhere are virtually nil.

Today’s engineering graduate in Japan—whether a college or senior high school graduate—starts at about 40,000 yen per month, or about $110, plus overtime.

In addition to his base salary and overtime, the young bachelor engineer receives about 1,500 yen a month to help pay his rent (a married engineer gets 2,000 yen), plus 1,000 yen a month for lunch. Yasunaga says. Most companies offer free use of beach houses in the summer and ski lodges in the winter for the employee and his immediate family.

Employees also receive two bonus checks a year at companies such as Rikadenki.

Complete medical coverage, including dental bills, is provided by joint contributions from the Japanese Government and the company.

The new engineer at Rikadenki receives two months of on-the-job training.

The managing director himself, Yasunaga notes, takes part in a most important segment of the first month’s program. New engineers are taught how to conduct themselves properly in the presence of senior staff members. They learn how to address superiors, how to speak politely and how to bow respectfully. Bowing is not considered demeaning—it is a gesture as courteous as a handshake or a military salute.

Are Japanese engineers satisfied with the system? Kiyokatsu Negishi appears quiet and confident as he discusses his job and its responsibilities. He doesn’t own a car, but his earnings have permitted him to buy, besides the house, a washing machine, TV set and other so-called luxuries. His company has been growing at a sound, steady pace, and he appears satisfied as his career progresses. At 35 years old, Negishi has no gray hairs. **
INTEL BOMBS THE PRICES ON LSI MEMORIES

Industry prices cut more than half

Very high yields at Intel are beginning to realize the long-promised economies of LSI. Using advanced technologies—like the silicon gate for MOS and the Schottky process for bipolar—Intel has achieved yields far greater than the 2% or 3% typical of LSI production.

First major price reductions have been made on two fully-decoded random-access memories, both DTL and TTL compatible. Look at the difference between old and new prices:

Electromechanical sensors, such as linear transformers, resolvers and synchros, are commonly used in control systems because they provide precision and economy. With the application of digital computers in control systems, simple and accurate methods for converting the ac outputs of these sensors into digital form become vital.

This design guide briefly reviews conventional methods for making such conversions. It then describes improved techniques leading to efficient, lower-cost hardware.

Methods for encoding ac signals using standard equipment divide into the following areas:

Single-phase ac-to-digital converters

Three types of ac-to-digital converters occupy the single-phase classification: asynchronous, sampling and integrating.

1. Asynchronous single-phase ac-to-digital converters. This conventional system for encoding ac signals uses one inversion amplifier, one or two phase-sensitive demodulators and a dc-to-digital converter (Fig. 1). One demodulator always converts the ac signal, \( V_{Xac} \), into a dc signal, \( V_{Xdc} \). A second demodulator is needed only when the digital output signal, \( X_D \), must represent the ratio \( V_{Xac}/V_{Rac} \) exactly.

\( V_{Xac} \) is a function of signal amplitude and the phase relationship between the signal and the reference. Therefore, both \( V_{Xac} \) and \( V_{Rac} \) are connected to the demodulator in the signal path. \( V_{Rac} \), by contrast, is a function of just the reference amplitude. Only \( V_{Rac} \) is connected to the demodulator in the reference path. If \( V_{Xdc} \) is a bipolar signal, then positive and negative reference potentials are required. A standard operational amplifier, connected as unity gain inverter, provides the negative reference voltage, \(-V_{Rdc}\).

Circuit operation depends on the combined performance of the dc-to-digital converter, op amp and demodulator. Over-all conversion error is the demodulator error plus the dc-to-digital converter error, whereas converter bandpass is related to the demodulator low-pass filter time constant and the encoder transport delay.

2. Single-phase sampling ac-to-digital converter. This method of ac signal conversion can be used...
with any high-speed a/d converter. The dc-to-digital converter of Fig. 2 will accept ac signals with the addition of two amplifiers and two single-pole switches.

The peak detector generates a control signal for the analog sampling switches, S1 and S2, by comparing the reference signal, \( V_{Rac} \), with a positive threshold voltage, \( V_{Th} \). To provide isolation from ac reference variations, \( +V_{Th} \) is generated by rectifying \( V_{Rac} \) and loading it so that \( V_{Th} \) is always less than the \( V_{Rac} \) peak amplitude. The width, \( t_c \), of the control-signal (\( V_c \)) pulses is set by adjusting the load resistor, \( R \), which in turn determines how much \( V_{Th} \) is below the peak value of \( V_{Rac} \). For proper operation, \( t_c \) must always be longer than the aperture time of the converter.

The two single-pole switches, S1 and S2, connect \( V_{Xac} \) and \( V_{Rac} \) to the converter for the duration of \( t_c \). Because the a/d converter digital output always represents the ratio \( V_X/V_R \), simultaneous changes in \( V_X \) and \( V_R \) are of no consequence provided all variations are proportionally equal. This condition is fulfilled by two sine waves of different amplitudes. The conversion time, \( T_c \), need not be extremely short. A reasonable value for \( T_c \) is less than 5% of \( T_p \), the repetition period of the ac signal.

Sampling ac-to-digital converters possess a high noise-rejection capability when identical noise is present on the signal and the reference. (This is the case in most applications.)

The control signal, \( V_c \), is needed to synchronize converter operation with the reference signal peaks. For example, the positive-going edge on \( V_c \) can be used to start the conversion.

The inversion amplifier generates the negative reference voltage, which is essential if \( V_X \) is a bipolar signal.

The sampling ac-to-digital converter accuracy is essentially the same as that of the dc-to-digital converter, since the peak detector will not introduce discrepancies, and switching errors can be made negligible.

3. **Integrating ac-to-digital converter.** Up/down integration a/d converters can be used to implement an integrating ac encoder (Fig. 3). With such a converter, the ac signal is integrated during the up integration period, \( T_1 \), and the dc reference is integrated during the down integration period, \( T_2 \). The up and down integration periods must be exactly one-half the ac signal period.

Figure 3 illustrates that one ac-to-dc converter and two amplifiers must be added to the up/down integration converter to make it accept ac signals. One amplifier is employed as a zero crossing detector and the other as a unity-gain inverter. The ac-to-dc converter may be either a phase-sensitive demodulator or a precision rectifier. It is needed only when a precise ratio of \( V_{Xac}/V_{Rac} \) is required.

Electronic Design 6, March 15, 1970

1. **Asynchronous converter** uses off-the-shelf hardware but is relatively slow.

2. **Single-phase sampling converter** provides input signal noise rejection and high speed.

3. **Integrating converter** is sensitive to clock and signal frequency variations.

4. **Integrator output** (c) shows ac signal integrated during \( T_1 \), dc reference integrated during \( T_2 \).
must be determined.

The first amplifier can be a comparator that provides HIGH level output when \( V_{Rae} \) is positive and LOW level output when \( V_{Rac} \) is negative. The comparator output is a square-wave signal (Fig. 4b) with the same frequency as \( V_{Rae} \) or \( V_{Xae} \). This square wave defines the two integration periods; \( T_1 \), the up integration period, and \( T_2 \), the down integration period. It can be shown that \( t_s \) is a function of the ratio \( V_X/V_R \) and of the sine-wave period, \( T_p \).

With a dc integrating a/d converter, the period \( T_1 \) is constant and the digital output signal is independent of the converter clock frequency, \( f_c \). But in an up/down ac integrating a/d converter, \( T_1 \) is half the sine-wave period, and since the ac signal frequency changes widely, large errors result. Large errors are also produced by clock frequency variation, which is not compensated for, as in a dc converter. This design has limited accuracy and flexibility.

**Resolver-to-digital sine/cosine converters**

Asynchronous and sampling models comprise the sine/cosine converter category. This converter design has one significant advantage over the more sophisticated resolver to digital angle converters; there is no requirement for octant selection circuitry.

In a resolver-to-digital converter, the resolver output signals, \( V_X(t) \) and \( V_Y(t) \), can be converted into a pair of digital signals, \( X_D \) and \( Y_D \), with two ac-to-digital converters. \( V_X(t) \) and \( V_Y(t) \) are sine-wave signals of the same frequency, \( \omega \), (Eq. 2 and 3 in box) with amplitudes of \( K_X E_0 \cos \theta \) and \( K_Y E_0 \sin \theta \).

The ratio between \( V_X \) and \( V_Y \) must be maintained precisely. Neither the absolute accuracy nor the linearity of the two ac-to-digital converters is important. It is of critical concern that the gain and linearity of the ac-to-digital converters should track over all operating regions and environments.

Resolver-to-digital sine/cosine converters do not require quadrant or octant selection circuits, but they do require two a/d converters. Sine/cosine converters provide sine \( \theta \) and cosine \( \theta \) outputs instead of \( \theta \), usually a disadvantage.

The asynchronous resolver-to-digital sine/cosine converter (Fig. 5) is comprised of two ac-to-dc converters and two dc-to-digital converters. Because the outputs of the ac-to-dc converters are dc signals, operation of the dc-to-digital converters need not be synchronized with the ac input signals.

Most types of dc-to-digital converters can be used in this asynchronous converter, but since most ac signals change slowly with time, a high-speed converter is not needed unless it is to be time-shared between a large number of resolver outputs.

The converter accuracy depends on the gain and linearity match in the dc-to-digital converters, and is a function of their zero offset level.

The sampling resolver-to-digital sine/cosine converter (Fig. 6) consists of two dc-to-digital converters, two sampling switches and one peak detector. Reduction in hardware is obtained at the cost of synchronizing dc-to-digital converter operation with the ac input signal peaks. The output of the peak detector, \( V_C \), operates both sampling switches, \( S_1 \) and \( S_2 \), and starts the conversion operation in both dc-to-digital converters.

The signal inputs to the two dc converters are pulsed dc voltages representing the peak amplitudes of \( V_X(t) \) and \( V_Y(t) \); the reference inputs are the dc reference voltages \( +V_R \) and \( -V_R \). The outputs \( X_D \) and \( Y_D \) are binary signals, proportional to the sine and cosine of resolver shaft angle \( \theta \). Just as for the asynchronous version, ultra-high-speed a/d converters are not needed unless many resolver signals are to be converted through the same encoder.

**Resolver-to-digital angle converters**

The synchro/resolver-to-digital angle converter design approach provides the basis for accurate and efficient ac-to-digital converters. Six types (designated Type I through VI) will be considered in detail, beginning with Type I in this installment. The majority of synchro/resolver-to-digital angle converters require octant selection circuits, described in the following paragraphs.

Most resolver-to-digital converters determine the quadrant or the octant of the resolver shaft angle by comparing the magnitudes and polarities of the resolver output signals \( V_X \) and \( V_Y \). The criteria for this comparison is as follows:

<table>
<thead>
<tr>
<th>Octant</th>
<th>Polarity of ( V_X )</th>
<th>Polarity of ( V_Y )</th>
<th>Magnitudes of ( V_X ) and ( V_Y )</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

The principle and problems are similar, whether resolver-to-digital angle converters select octants or quadrants. Only octant selection circuitry will be described here. (Note: Octant selection circuits...
Electromechanical sensor ac signals defined

All information from electromechanical sensors is contained in amplitude modulation of the ac output signal. A single-phase ac signal (from a linear transformer) is defined as

$$V(t) = E \sin(\omega t + \psi)$$  \hspace{1cm} (1)

where $E$ is the amplitude, $\omega$ is the frequency, $t$ is the time and $\psi$ is the phase angle with respect to some reference.

A two-phase ac signal (from a resolver) is defined as

$$V_x(t) = K_x E \cos\theta \sin(\omega t + \phi_x)$$  \hspace{1cm} (2)
$$V_y(t) = K_y E \sin\theta \sin(\omega t + \phi_y)$$  \hspace{1cm} (3)

where $V_x(t)$ and $V_y(t)$ are sine-wave signals with amplitudes of $K_x E \cos\theta$ and $K_y E \sin\theta$, respectively, with a frequency of $\omega$ and phase shifts of $\phi_x$ or $\phi_y$.

In the expressions for the amplitudes, only $\sin\theta$ and $\cos\theta$ vary; the reference amplitude $E_0$ and the gain factors $K_x$ and $K_y$ are constant.

A three-phase ac signal (from a synchro) is defined as

$$V_1(t) = K_1 E_0 \sin\theta \sin(\omega t + \psi_1)$$  \hspace{1cm} (4)
$$V_2(t) = K_2 E_0 \sin(\theta + 120^\circ) \sin(\omega t + \psi_2)$$  \hspace{1cm} (5)
$$V_3(t) = K_3 E_0 \sin(\theta - 120^\circ) \sin(\omega t + \psi_3)$$  \hspace{1cm} (6)

where $V_1(t)$, $V_2(t)$ and $V_3(t)$ are sine-wave signals with amplitudes of $K_1 E_0 \sin\theta$, $K_2 E_0 \sin(\theta + 120^\circ)$ and $K_3 E_0 \sin(\theta - 120^\circ)$, respectively, with a frequency of $\omega$, and phase shifts of $\psi_1$, $\psi_2$, $\psi_3$. In the expressions for the amplitudes, only $\sin\theta$, $\sin(\theta + 120^\circ)$ and $\sin(\theta - 120^\circ)$ vary; the reference amplitude $E_0$ and the gain factors $K_1$, $K_2$ and $K_3$ are constant.

A common misunderstanding holds that transmitted resolver and synchro signals contain data in the phase shift between sine waves. This concept is wrong. A synchro or resolver introduces a spacial, or positional, phase shift, and not a phase shift in time. The terms $\sin\theta$, $\cos\theta$, $\sin(\theta + 120^\circ)$ and $\sin(\theta - 120^\circ)$ only modulate the amplitude of the reference sine wave, $(E_0 \sin\omega t)$. Any phase shift on these signals is a secondary effect due to parasitic parameters.

It is not the absolute magnitude of the amplitude that carries this information, but the magnitude ratio of two or more signals. With a single-phase signal, the amplitude ratio between the signal, $V_x$, and the reference, $V_R$, carries the information. With two-phase signals, the ratio $V_x/V_y$ represents data transmitted (Eq. 2 and 3). Similarly, the relationships between $V_1$, $V_2$ and $V_3$ (Eq. 4 to 6) transmits three-phase signal intelligence. All ac-to-digital conversions must be such that the digital output signal ($X_D$) is always the ratio of two ac signal amplitudes. This is easy to accomplish with any a/d converter, since $X_D = V_x/V_R$.

Normally, the frequency and amplitude of the reference ac signal can change over wide limits. In an aircraft, the 400-Hz supply voltage may vary between 380 and 420 Hz and $\pm 10\%$ in level. Electromechanical sensors are insensitive to these variations since information is carried as an amplitude ratio. Also, considerable noise is often superimposed on ac signals. A thorough description of ac signal noise is given in MIL-STD-704A.

All known synchro signal encoding methods transform three-phase signals into two-phase signals, which are then converted into digital form. Each synchro-to-digital encoder consists of a three-phase to two-phase converter and a resolver-to-digital encoder. Standard three-phase to two-phase conversion uses two transformers in a classical Scott-T connection. These Scott-T transformers can be built with high accuracy and reasonable cost, but are still large compared to IC packages.

To overcome size incompatibility, electronic Scott-T converters have been developed. They are small and light but not as accurate as transformer types.
Octant selected by comparators

To determine the octant position of a resolver shaft, the output signals, \( V_{Xac} \) and \( V_{Yac} \), which are amplitude-modulated ac signals (Eqs. 2 and 3 in box), must be examined for their relative amplitude and polarity. The amplitude and polarity of \( V_X \) and \( V_Y \) are plotted as a function of the resolver shaft angle \( \theta \) in Fig. 7a. Most resolver-to-digital angle converters accept input signals only if they lie in the first octant. This means that the amplitude of \( V_Y \) is between zero and \( +0.707 \) of full scale, and the amplitude of \( V_X \) is between \( +0.707 \) of full scale and full scale. The octant selector determines which of the four resolver signals — \( +V_X, -V_X, +V_Y \) or \( -V_Y \) — contains first octant information.

In the octants listed below, the circuit selects the following resolver output signals, \( V'_X \) and \( V'_Y \) (refer to Fig. 7) as inputs to the resolver-to-digital converter.

- For \( V_Y' \)
  - \( V_Y' \) in 01 and 02
  - \( +V_X \) in 03 and 04

- For \( V_X' \)
  - \( +V_X \) in 01 and 02
  - \( +V_Y \) in 03 and 04
  - \( -V_X \) in 05 and 06
  - \( -V_Y \) in 07 and 08

With the Type II converter (shown later) \( V'_X \) and \( V'_Y \) are resolver bridge inputs; in other cases \( V'_X \) becomes the reference input, \( V_{in} \), and \( V'_Y \) the signal input, \( V_{sn} \), to a conventional a/d converter.

After the resolver output signals are converted to dc voltages, the octant control signals (Fig. 7b) can be generated by four comparator circuits, CP-1 through CP-4 (in Fig. 8) which identify the octant. The function of the four comparators is as follows:
- CP-1 detects when \( V_X \) is positive
- CP-2 detects when \( V_Y \) is negative
- CP-3 detects when \( V_X \) is more positive than \( V_Y \)
- CP-4 detects when \( V_Y + V_X \) is negative

By gating appropriate output combinations of CP-1 through CP-4 and their complements, any two of the eight octants can be addressed. Four of the eight control signals so generated, \( V_{C1} \) to \( V_{C4} \), can be used to select \( V'_X \). Another four signals, \( V_{C5} \) to \( V_{C8} \), select \( V'_Y \) (Fig. 7c). The resulting output signals, \( V'_X \) and \( V'_Y \), for the eight octants are depicted in Fig. 7d.

Since the resolver output signals are amplitude-modulated ac signals and differential amplifiers are used as comparators, \( V_{Xac} \) and \( V_{Yac} \) must be processed before the desired comparisons can be performed.

Figure 8a illustrates a method where the resolver output signals are converted into dc voltages, \( V_{Xde} \) and \( V_{Yde} \), with two phase-sensitive demodulators. The two sets of selector switches, \( S_{1X} \) to \( S_{4X} \) and \( S_{1Y} \) to \( S_{4Y} \), can then connect ac or dc output signals to the ensuing circuit.

Another solution (Fig. 8b) connects \( V_{Xac} \) and \( V_{Yac} \) to the comparators only during the peak of the sine wave. The inputs to the comparators become pulsed dc signals. All switching can be performed with a peak detector and two sampling switches (see the sampling ac-to-digital converter of Fig. 2). With the inputs applied during short periods \( (T_P) \) the output signals, \( V'_X \) and \( V'_Y \), are useful just during \( T_P \). Only a sampling ac-to-digital converter can be used with this octant selection circuit.

For all resolver-to-digital converters using ac bridges, digital storage must be provided so that the comparator output signals can be memorized between any two peak pulses. This can be achieved by shifting each comparator output into a single-stage shift register at the beginning of each peak pulse (Fig. 8c). With this provision, the input to all eight selector switches may be an ac or dc signal.

One significant difference between the first circuit (Fig. 8a) and the last two circuits (Figs. 8b and 8c) is speed. The former incorporates a low-pass filter in the ac-to-dc converter. In contrast, the latter two circuits have no such frequency濙濙
8. Octant selection circuits use phase-sensitive demodulators (a) for converting resolver outputs to dc. Sampling technique (b) provides octant selection with inputs applied during short periods \(T_p\). Digital storage (c) allows memorization of comparator outputs between any two peak pulses.
Type I converter needs precision parts

The Type I converter concept is simple, but hardware requirements are complex. Precision RC networks, which must be stable with time and temperature, are required. In this design approach, output signals of a resolver, \( V_X(t) \) and \( V_Y(t) \), are connected across two RC phase-shifting networks (Fig. 9). The voltages \( V_A \) and \( V_B \), at the junction of R and C of the two networks, are sine waves whose amplitude and phase are functions of \( V_X(t) \) and \( V_Y(t) \). Assuming that \( V_X(t) \) and \( V_Y(t) \) are the outputs from an ideal resolver;

\[
V_X(t) = E_0 \cos \theta \sin \omega t \quad (7)
\]

\[
V_Y(t) = E_0 \sin \theta \sin \omega t \quad (8)
\]

Further assuming the values of R and C are chosen so that \( \omega RC = 1 \), then \( V_A(t) \) and \( V_B(t) \) can be expressed as

\[
V_A(t) = \frac{V_X(t) - j V_Y(t)}{1 + j} \quad (9)
\]

and

\[
V_B(t) = \frac{V_Y(t) - j V_X(t)}{1 + j}. \quad (10)
\]

Multiplying \( V_X(t) \) with \( \tan \theta \) gives

\[
V_Y(t) = V_X(t) \tan \theta \quad (11)
\]

Substituting Eq. 11 into Eq. 9 yields

\[
V_A(t) = V_X(t) \left[ 1 - j \tan \theta \right] / (1 + j). \quad (12)
\]

The amplitude of \( V_A(t) \) is

\[
V_A = \sqrt{1/2 (1 + \tan^2 \theta)} \ E_0 \cos \theta \sin \omega t \quad (13)
\]

and the phase shift with respect to \( V_X(t) \) is

\[
\phi_A = \theta - 45^\circ. \quad (14)
\]

Similarly, the amplitude and phase shift of \( V_B(t) \) are

\[
E_B = \sqrt{1/2 (1 + \tan^2 \theta)} \ E_0 \sin \theta \sin \omega t \quad (15)
\]

and

\[
\phi = -\theta + 45^\circ. \quad (16)
\]

The total phase angle between \( V_A(t) \) and \( V_B(t) \) then becomes

\[
\phi_{A-B} = \phi_A - \phi_B = 2\theta - 90^\circ. \quad (17)
\]

From Eq. 14 or 16 it can be seen that the phase shift \( \phi \) between \( V_A(t) \) or \( V_B(t) \) and the reference sine wave, \( E_0 \sin \omega t \), is directly proportional to the shaft angle \( \theta \) of the resolver.

The simplified diagram in Fig. 10 shows that the resolver-to-digital angle converter consists basically of the phase-shift network, two comparators, pulse gating logic, a unidirectional counter and an intermediate storage register.

The two phase-shift networks (Fig. 9) convert the variable-amplitude signals \( V_X(t) \) and \( V_Y(t) \) into two variable-phase signals, \( V_A(t) \) and \( V_B(t) \). The resistors, \( R_1 \) and \( R_2 \), and the capacitors, \( C_1 \) and \( C_2 \), determine the phase shift and the gain of the networks.

9. Phase-shift network for the Type I converter requires precision RC components.
and $C_2$, must be able to satisfy and maintain the relationship $\omega R C = 1$. This requires precision resistors and capacitors trimmed to the proper value.

The ability to maintain $\omega R C = 1$ over time and temperature after trimming, is mainly a function of capacitor stability. With a temperature coefficient of 25 ppm, available from today's glass or porcelain capacitors, the value of $C$ will vary 0.35% (max) over a $-55^\circ C$ to $+85^\circ C$ temperature range. Sophisticated compensation networks are used by converter manufacturers for better temperature stability.

The two comparators (Fig. 10) detect the zero crossings of $V_A(t)$ and $V_B(t)$. The output signals of these comparators are square waves with the same frequency as $V_A$ and $V_B$, but phase-shifted with respect to each other. One of these square waves, $S_A$, is used to set flip-flop FF-1, and to reset the counter with a narrow pulse. This pulse is generated by differentiating $S_A$ in the digital differentiator $D$.

The other square wave, $S_B$, resets FF-1. The output of FF-1 is a pulse-width signal whose ON time is determined by the zero crossing of $V_A(t)$ and $V_B(t)$. This makes the FF-1 output proportional to the angular position of the resolver. Provided the output of FF-1 is ONE, the clock pulses ($f_c$) are connected to the counter. The content of the counter will increase to a value ($N$), which is proportional to the resolver shaft angle $\theta$. At some convenient time, $N_\theta$ is transferred into a storage register where it can be read out as either a parallel or serial word, $X_{S-B}$.

To maintain the equation $\omega R C = 1$ requires stable resistors and capacitors, and a stable excitation frequency ($\omega$) for the resolver. In most applications, the resolver is energized from an ac supply with a frequency of 400, 1000, or 1800 Hz. The technique described above cannot be used with these supplies due to frequency drift. Special supplies are needed that exhibit good frequency stability.

The simplest technique for generating a high-stability ac reference voltage is to count-down the clock frequency ($f_c$) to a frequency at which the resolver can operate. Next filter and buffer the square-wave signal generated. Note, though, that the buffer amplifier required must be able to handle high power, since the reference winding load of each resolver will consume between 0.5 and 2 W. • •

Watch for Part 2

The second part of this Practical Guide for Synchro-to-Digital Converters will appear in our next issue, ED 7, April 1, 1970. This portion will include further synchro/resolver-to-digital angle converter design techniques.
end your signal pollution problems

Beldfoil® ISO-Shielded™ Cable

It's the cable with virtually perfect shielding. It's a Belden exclusive. Beldfoil ISO-Shield is like a continuous metal tube enclosing each pair of conductors in a cable. It locks out crosstalk or interference... whether from outside sources or between shielded elements in the cable. Beldfoil is a layer of aluminum foil bonded to a tough polyester film (for insulation and added strength.) To form an ISO-Shield, we apply it in any one of several unique ways to meet the requirements of different applications. (See Figures 1 and 2, for example.) Each gives more physical shield coverage than braided wire or spiral wrapped (served) shields. And greater shield effectiveness... even after repeated flexing. Beldfoil ISO-Shielded Cables are small, lightweight. They terminate easily. They're modest in price. Your Belden Distributor stocks a wide variety of standard Beldfoil shielded cables as listed in the "Belden Electronic Wire and Cable Catalog" (ask him for the latest edition). And, should you have specifications no standard product can meet, ask him to quote on a specially engineered design. Or, if you choose, contact: Belden Corporation, P. O. Box 5070-A, Chicago, Illinois 60680. Phone (312) 378-1000.
Beldfoil Multiple Pair Individually Shielded Cable

The Figure 1 cross-section shows Belden's exclusive Z-folded Beldfoil ISO-Shield. Note the metal-to-metal contact between the two edges of the aluminum foil. In essence, you have a continuous aluminum tube. And the polyester layer on the outside of the fold assures the isolation between shields so necessary for best performance in the field.

Technical Data

Nominal values for multiple pair individually shielded cables containing 3 to 27 pairs (including 8769 and 8773 through 8778 Series cables)

- Suggested working voltage: 300 volts rms max.
- Working voltage between adjacent shields: 50 volts rms max.
- Capacitance between conductors in a pair: 30 pf per ft. nom.
- Capacitance between one conductor and other conductor connected to shield: 55 pf per ft. nom.
- Capacitance between shields on adjacent pairs: 115 pf per ft. nom.
- Insulation resistance between shields on adjacent pairs: 100 megohms per 1000 ft. nom.

Beldfoil Shielded Single Pair Cable

The Figure 2 cross-section shows the exclusive Belden Z-fold with the polyester insulating layer inward. This makes use of the high dielectric strength of the polyester film as bonus insulation between the conductors and the shield. (The cable jacket provides the primary insulation of the shield from outside objects or adjacent cables.)

Technical Data

Nominal values for 8451 Shielded Pair Cable

- Suggested working voltage: 200 volts rms max.
- Capacitance between conductors: 34 pf per ft. nom.
- Capacitance between one conductor and other conductor connected to shield: 67 pf per ft. nom.
Program designs active filters.
Bandpass or bandstop RC circuits are specified fully, using versatile expanded BASIC.

Bandpass and bandstop filters are derived by connecting high and low-pass filters in series or in parallel, respectively. A recent article described the methods of designing active high- or low-pass filters by using a BASIC computer program. By extending that program, Butterworth or Chebyshev RC band filters can also be designed by computer.

Low-pass and high-pass filters are formed by cascading one or more of the circuit sections shown in Fig. 1. An even-pole filter uses only 2-pole sections and has Chebyshev ripple with unity-gain minimums. An odd-pole filter uses 2-pole sections, and a single 1-pole section and has Chebyshev ripple with unity-gain maximums.

Bandpass and bandstop filters are formed as shown in Fig. 2. The low-pass filter has \( N \) poles and a cutoff frequency of \( F \). The high-pass filter in both cases has \( N \) poles and a cutoff frequency of \( F \). With \( F > F \), the series combination of those two filters is a bandpass filter from \( F \) to \( F \). With \( F < F \), the parallel combination is a bandstop filter from \( F \) to \( F \).

In both the bandpass and band-reject cases, the skirt selectivity of the filters is that of the individual low-pass and high-pass filter rather than that of a true band filter. For such filters the asymptotic falloff rate of the skirts is measured in absolute decades of frequency rather than decades of half-bandwidths. This means that these low-pass/high-pass combination filters are better suited to broadband than to narrowband applications.

The program has many features

The BASIC computer program used is called RCFIL (Fig. 3). It includes:

- Design of bandpass and bandstop, as well as low-pass and high-pass filters.
- Design of odd-pole and even-pole filters.
- Graphical and tabular printout of gain and phase vs frequency.

- Optional printout of individual section responses.
- Optional independent choice of the C values in each section.

To execute a filter design, enter the specifications and printout control as DATA in lines 1-4 of the program (Fig. 3a), as follows (using actual numerical values, not the algebraic symbols shown):

```
1 DATA F1, N1, D1
2 DATA F2, N2, D2
3 DATA Z0, C
4 DATA O1, O2, O3
```

where

- \( F \) = low-pass cutoff frequency in kHz
- \( N \) = low-pass number of poles
- \( D \) = low-pass passband ripple in dB (\( D = 0 \) for Butterworth)
- \( F \) = high-pass cutoff frequency in kHz
- \( N \) = high-pass number of poles
- \( D \) = high-pass passband ripple in dB (\( D = 0 \) for Butterworth)
- \( Z \) = filter type (\( Z = 0 \) for low, high, or bandpass; \( Z = 1 \) for bandstop)
- \( C \) = maximum capacitance (nF)
- \( O \) = printout control of component values (\( O = 0 \) for not printing, 1 for printing)
- \( O \) = printout control of complete filter response (\( O = 0 \) for no printing, 1 for graph only, 2 for table only, 3 for graph and table)
- \( O \) = printout control of individual section responses (\( O = 0 \) for no printing, 1 for graphs only, 2 for tables only, 3 for graphs and tables)

For a simple low-pass or high-pass design, the unwanted filter characteristics in lines 2 or 1 must be entered as zeros.

The printout control variables \( O \), \( O \), and \( O \) in line 14 allow the selective deletion of unwanted output from the program. It is desirable to limit the amount of printout to those portions that are useful, because of the relatively slow printing speed (10 characters per second) of the teletype terminal. In normal use, line 4 is entered as 4 DATA 1, 3, 0, which produces a three-page printout—one page with the component

values, a second with the graph, and a third with the table. As options, any of these pages could be deleted, or the response of each individual section (graph or table) could be inserted, by retyping new DATA in line 4.

To satisfy certain specialized applications, the following options are available in the program:

- A log frequency scale may be preselected from F4 to F3 (in kHz) by retyping lines 15-16. The scale for frequency, which is the independent variable in both the graph and table printouts, is normally chosen to be suited to the filter type and cutoff frequencies. The provision for overriding this automatic frequency scaling is useful for directly comparing the responses of two different filter designs.

- The number of low-pass multiples (Z1) and high-pass multiples (Z2) may be chosen other than unity by retyping lines 17-18. Butterworth and Chebyshev filters with many poles require high-Q sections, which are less stable than low-Q sections. The provision for multiple filters allows the design of a lower Q filter composed of, say, three four-pole filters instead of a single 12-pole filter.

- The standard decade list of C values may be revised by retyping line 20. The first DATA number (in this case 6) tells the computer how many C values are included in the decade list. The following DATA numbers (10, 15 . . , 68) are the six C values, listed in increasing order from 10 to 99. The value of C2 in the low-pass 2-pole section (Fig. 1) is chosen from this list according to certain design constraints.

- The C values may be individually specified by retyping line 26 with Z = 1 and lines 27-30 with the C data (in nF) in the normal order of printout (see Fig. 4a). This provision allows scaling of the C values either to limit the spread of R values or to find the precise R values required for a measured set of C values. The selection of C values must be consistent with

1. One and two-pole sections are cascaded to form multiple pole filters. The computer selects component values to get Butterworth or Chebyshev response.

2. Combine low and high-pass filters to get band filters. If \( F_2 > F_1 \), the filter is bandpass, if \( F_1 > F_2 \), it is a band-stop filter.

3. Component values are computed by this expanded BASIC program: (a) is the main program; (b) is a list of the subroutines used in the main program; (c) is a flow chart of the complete program.

Understand the program

The program RCFIL is written in BASIC. Because of its length (about 12,000 characters) this program must be used on an extended BASIC time-shared computer.

Figure 3a shows the “Main Program” (about 50 lines in length) of the program. The main program calls several specialized subroutines, listed in Fig. 3b. The use of a subroutine structure is particularly advantageous in longer computer programs because it simplifies the writing and debugging procedures, and keeps the program flexible for possible future modifications.

The computer works on each line in the main program sequentially until it reaches line 600, at which point it stops and returns control to the user. This prevents the use of the subroutines except as specifically directed within the main program by GOSUB command. The operation of the main program is indicated in flow-chart form in Fig. 3c.

The “Frequency Scale” subroutine chooses the points of the frequency scale according to the filter type and cutoff frequencies. Low-pass filters use a linear frequency scale, high-pass an inverse linear scale, and combined (bandpass or bandstop) a log scale. The frequency values, which form the independent scale in the graph printout (Fig. 4), are rounded off to three places for convenience.

The frequency-scale subroutine also calculates a series of points that are larger than the primary points by 0.01%. These varied frequency points are required in the “Cum Response” subroutine to compute time delay, which is the instantaneous slope of the filter phase vs frequency curve.

The “Heading” subroutine prints the filter type at the top of each page in order to avoid confusion between printouts for different designs. Each of the pages of printout—component values, graph and table—is adjusted to be 66 lines in length. In this way the heading appears at the same position on each successive 8-1/2-by-11-inch sheet of teletype paper.

The subroutines for the pole locations and the two-pole low-pass and high-pass sections are derived from the equations presented in Reference 1. The phase calculations—based on the use of the arc-tangent function—are derived in a manner similar to that for gain calculations.

The “Odd-Section” subroutine finds the component values and response for the single one-

FREQUENCY (KHZ)
4. A Butterworth bandpass filter is designed by the computer in (a). The response is plotted in (b), and the circuit is drawn in (c).

Sample designs illustrate technique

Two filter designs using the expanded computer program demonstrate the use of the technique. The first example is a Butterworth bandpass filter (Fig. 4) composed of a 3-pole low-pass section at 10 kHz and a 4-pole high-pass section at 1 kHz. The second is a Chebyshev bandstop filter (Fig. 5) composed of a 2-pole low-pass section at 200 Hz with 1 dB passband ripple, and a 3-pole high-pass section at 5 kHz with 1 dB ripple.

To solve the first design, the filter specifications are entered as DATA in lines 1-3, as shown in the program listing of Fig. 3. Line 1 specifies the low-pass filter, line 2 the high-pass filter, and line 3 a bandpass (series) configuration with a maximum capacitance value of 10 nF. Line 4 specifies print-out of the component values and the response of the complete filter in both graphical and tabular forms. Print-out of the responses of the individual sections is suppressed.

When the program is run, a three-page printout is generated. Each page begins with a descriptive heading. Figure 4a shows the first page, which gives the component values, and Fig. 4b shows the second page, containing a graph of gain and phase vs frequency. The third page, a table of gain, phase and time delay vs frequency, is not shown here. The table can however give more information than the graph and it should be used for frequencies above and below those.

FREQUENCY (KHZ)

194

ELECTRONIC DESIGN 6, March 15, 1970
A Chebyshev bandstop filter design is computed by the program in (a). The frequency response is given in (b), and the circuit in (c).

The gain values in Fig. 4b are plotted with the letter G on a scale of −15 dB to +3 dB, and the phase values are plotted with the letter P from −300° to +300°. The frequency scale is logarithmic from half the high-pass cutoff frequency to twice the low-pass cutoff frequency.

The resulting filter design, using the circuits of Fig. 1 and the computer-determined component values of Fig. 4a, is shown in Fig. 4c. The individual sections of both the low-pass and high-pass filters are all cascaded in series. A high-pass is used as the first of the cascaded sections in order to get ac coupling at the filter input. The 2-pole sections are ordered from low Q to high Q to avoid amplitude clipping due to the resonant rises in the higher Q sections.

To solve the second design example, the filter specifications must be entered as DATA by retyping lines 1-3, as shown below:

1 DATA 0.2,2,1
2 DATA 5,3,1
3 DATA 1.22

When the program is run with these DATA lines, the printout of Fig. 5 is generated. Figure 5a gives the component values, while Fig. 5b is a graph of gain and phase vs frequency. The resulting filter design, Fig. 5c, uses the circuits of Fig. 1 and the band-stop configuration of Fig. 2 with the computer-determined component values.

The phase jump of 360° at 1 kHz (Fig. 5b) is an artifact of the bandstop filter realization. In order to obtain 0° phase shift through the low-pass filter at low frequencies, while maintaining 0° through the high-pass filter at high frequencies, a phase jump of an integer multiple of 360° is necessary. Although this phase jump is unreal, it is permissible representation, since phase multiples of 360° are undetectable at a single frequency. To obtain 0° phase extremes with this program, the phase jump is arbitrarily set at the geometric mean frequency.

Because of the Chebyshev realization method, even-pole filters have unity-gain ripple minimums, and odd-pole filters have unity-gain ripple maximums. This effect can be seen in the response of the band-stop Chebyshev filter design (Fig. 5b). The 2-pole low-pass portion of the filter is an even-pole filter and has passband gain between 0 dB and +1 dB, while the 3-pole high-pass is an odd-pole filter and has passband gain between −1 dB and 0 dB. ■

References:
From CRT display to hardcopy printout. In seconds!
A plotter takes 30 minutes. A dry-silver photographic process makes muddy copies. But at Adage, Inc. the Gould 4800 Electrostatic Printer puts out clean hard copy in seconds. No wait. No wonder the 4800 is now a catalogued item for Adage Inc.'s award-winning Graphics Terminal.

The Graphics Terminal is a CRT display computer system with infinite potential for interactive graphics applications in science and engineering. To name a few, cockpit design, mathematical equations and printed circuit cards.

Having the 4800 Electrostatic Printer on line the user can alter his design equation with a light pen and have clean hard copy of any stage within seconds. Adage officials say their system is further enhanced by the economy of the 4800. It doubles as a printer by putting out both alphanumerics and graphics. It has fewer moving parts to maintain than conventional equipment. And Adage interfaced the 4800 in a matter of days . . . at surprisingly low cost.

More 4800 facts:
At 412,000 characters per minute, the Gould 4800 breaks the old printout bottleneck on your computer. It reproduces signals from any source of digital input or data transmission by telemetry, radio microwave and/or land line, quickly, quietly, accurately and economically.

4800 can probably recap the same benefits for your system as it does for Adage's Graphics Terminal. Write us to see. Don't wait. Graphics Division; Gould Inc., 3631 Perkins Avenue, Cleveland, Ohio 44114.

Gould 4800. The next generation of high-speed printers.
Like magic . . . vector impedance instruments read out complex impedance in an instant.

With the HP impedance meters, measurements involving impedance magnitude, Z, and phase angle, $\theta$, no longer require tedious test procedures. These measurements are now as easy to make as voltage readings. No nulling . . . no balancing . . . no calculations to make. The wizardry of these HP instruments provides direct readout of $Z$ (in ohms) and $\theta$ (in degrees) over a continuous frequency range.

HP 4800A Vector Impedance Meter covers the 5 Hz to 500 kHz range. You set the frequency, select the impedance range and read: $Z$ from 1 ohm to 10 Megohms, and $\theta$ from $-90^\circ$ to $+90^\circ$. $1650.

HP 4815A RF Vector Impedance Meter covers 500 kHz to 108 MHz. Measures, via a probe, active or passive circuits directly in their normal operating environment. $Z$ from 1 ohm to 100 K ohms; $\theta$ from 0° to 360°. $2650.

Application Note 86 describes many applications of the 4800A and the 4815A Vector Impedance Meters including the measurement of $Z$, $R$, $L$, and $C$. For your copy and complete specifications, contact your local Hewlett-Packard field engineer or write: Hewlett-Packard, Green Pond Road, Rockaway, New Jersey 07866.

In Europe: 1217 Meyrin-Geneva, Switzerland.

IMPEDEANCE INSTRUMENTS
Electromagnetic interference worry you?
It won't, if you apply these easy-to-follow suppression recommendations to your equipment.

It's hard to escape unwanted electromagnetic energy in the world. It exists virtually everywhere today and hampers the performance of many sensitive electronic devices. Turn on the radio in your car, and sooner or later you'll encounter static from neon lights, electric power lines, lightning or the ignition system. The television set in your home is vulnerable to spurious energy generated by electric blenders, power tools, vacuum cleaners and other appliances. Most of these electromagnetic interferences are merely objectionable. But they can be catastrophic in such sensitive circuitry as aircraft navigational guidance systems and computers.

Unwanted energy can enter the susceptible circuit along conductive paths, such as power lines and signal cables. Or it can be radiated through the atmosphere around the circuit. Usually the proper installation of metallic radio-frequency bonding, shielding and electrical filtering members interrupts the flow of spurious energy and causes it to dissipate or to be diverted from the circuit. This protection allows the circuit to perform as intended in its electromagnetic environment.

In addition to protecting the circuit, the properly installed shield tends to contain internally generated energy that could affect the performance of unprotected circuits nearby. It has been observed that certain areas of electronic equipment are especially vulnerable to electromagnetic interference and that these critical points are found in most equipment. They must be protected by shielding if the interference is to be contained.

Let's examine these vulnerable areas and see how they can be protected. The accompanying photos give the highlights of a step-by-step shielding design for a small computer, without going into specific radio-frequency bonding methods or hardware. Although the computer is used as an example, the recommendations are general in nature and can be applied to other types of electronic circuitry that requires shielding protection.

The fundamentals of good shielding design

How effective the shielding configuration is depends largely on the electrical continuity throughout the shield. In general, the areas of prime concern are apertures, such as cooling vent holes, and member interface areas, such as cover-frame seams. Good radio-frequency bonding technique must assure that electrical continuity will be maintained. Because of this, the critical areas must be paint-free and the surface treated with electrically conductive coatings.

The measure of the shield's over-all ability to reduce radiated electromagnetic energy is called shielding effectiveness, or attenuation. It is measured in decibels as a function of frequency.

It is difficult to specify a desired level of circuit protection for electronic products, since there are so many variables. Among these are the impedance of the circuit, its function and susceptibility to noise, and the anticipated electromagnetic environment at user locations. Specialized measurements of radiated interference or susceptibility levels can help designers estimate the circuit protection needed in accordance with electromagnetic-compatibility standards, whether commercial or military. Regardless of requirements, the design task follows the sequence shown in the accompanying figure.

One technique that is especially useful is the fingerstock closure. These devices, illustrated in Fig. 10, provide the spring-loaded contacts and wiping action for self-cleaning. They may be mounted either on both mating surfaces, to cover at 45°, or on one surface, with a 90° knife edge on the other.
1. A typical computer, with some of the circuit areas that require protection from unwanted electromagnetic energy: the external covers, cabling and the operator's console area.

2. The basic member of the shield system is the metallic frame, assembled so that electrical integrity is maintained throughout. An electrically conductive surface treatment provides a radio-frequency (rf) bonding base for the attachment of covers, panels and internal subassemblies. Electroplated cadmium, zinc or nickel has been used in the past. Electroplated tin over nickel is satisfactory when used with light-pressure rf bonding members, because tin oxides are soft and electrically conductive.

3. Vent panels at the top and bottom of the conductive frame use closely spaced (eight inches maximum) fasteners and provide for shielding and cooling. Rf mesh gasket material may be used to provide additional metal-to-metal contact between the plated surfaces. The geometry of the air passage perforations follows the suggestions of UL safety specifications.

4. The addition of power equipment to the system demands considerations for preventing unwanted energy from entering along the power cables. An electrical filter and the external shield are recommended to provide protection. The input side of the filter should be made electrically continuous with the shield by using paint-free electrically-conductive areas, threaded fasteners and rf mesh gasket material.

5. Externally routed signal cables may be enclosed in suitable shields. It is important to provide adequate termination at the cable entry aperture. A special cable termination bulkhead (shown here with one cable attached) may be used if many cables are involved.

6. Some internal enclosures, such as the power supply in this case, require access panels (lower left) for assembly, inspection or maintenance. These panels may have paint-free conductive mounting surfaces to allow metal-to-metal contact.
Proper routing of cables provides protection at minimal cost. Power cables (black) should be kept close to and parallel with frame members in the lower part of the structure. Control cables, such as those associated with the operator’s console (right center), should be similarly treated. Signal cables (white) should be suspended away from frame members with nonconductive supports. Spacings of at least 1.00 inch from frames, at least 12 inches from other cables and routings near the top of the structure should be observed for the signal cables.

Each control panel (bottom) should have paint-free electrically conductive mounting surfaces and rf mesh gasket members (behind control panel) may be added for additional metal-to-metal contact area. Controls, such as switches, should be housed in metal and rf bonded to the mounting panel. Back shielding can be used with shielded controls. Indicator lamps should have minimum-sized apertures. Visual access areas, such as meters or displays, may be shielded with fine mesh screen or with metallic-coated glass.

Easy attachment and replace-ability of covers, in addition to damage protection, is achieved by using an electrically conductive fingerstock mounting channel. The pre-plated channel is an integral part of the cover assembly, attached and masked-off prior to cover-painting operation. Full-cover fingerstock peripheral protection is possible, as in "a". A double row of tin plated fingerstock members are contained in a mounting channel by self-exerted spring pressure, as shown in "b". Short sections of fingerstock may be spotted at random locations or full fingerstock population is possible. A knife edge, attached to the frame, contacts the fingerstock when the cover is closed. Of special interest is the fact that the channels and fingerstock can be attached to a plated sub-plate, as shown, to serve as a shield. This shield can then be attached to any cover, metallic or non-metallic, to provide shielding protection to the circuitry.

A conductive flange on the mating cover simplifies the installation of fingerstock (not shown) on the center seam. This technique demands cover sequencing during opening and closing.
Dow Corning® silicone sealants and protective coatings are the only ones that do not release acetic acid or other corrosive by-products during cure. They were specifically developed to protect delicate circuit boards and other electronic components from corrosion, dust, dirt, abrasive particles, solvents and chemicals. They are strong, have excellent bond strength, electrical strength; are easy to apply, and cure quickly. There's no "vinegar" smell, either. Dow Corning 3140 (clear) and 3141 (opaque) RTV coatings are ready-to-use silicone rubbers that cure at room temperature. They are ideal for conformal coatings on printed circuit assemblies or for encapsulating small circuits or connectors. Dow Corning 3144 (clear) and 3145 (opaque) RTV adhesive/sealants are high-strength, non-corrosive, nonflowing silicone rubbers used to bond components and seal housings and connectors.

Stop component corrosion with these Dow Corning coatings and sealants. For more information, write Dow Corning Corporation, Dept. B-9342, Midland, Michigan 48640.

That ‘dream’ job might be a nightmare!
To ensure against employment disappointment, get to know your prospective employer as well as he knows you.

Are you in the market for a new job? If so, or if you plan to be, consider how elated you perhaps felt when you were offered your present position. Perhaps you later experienced a vague, dull disappointment when you discovered that the employment package so handsomely wrapped for you proved to be something other than a present. The message should be clear: Before you leave your present position, take a long and thorough look before you leap into a new one.

Even if you are reasonably satisfied in your current position, there is an obvious career advantage in keeping aware of the operations of competitive companies.

Evening the odds

When you hand your resume to a personnel recruiter, the odds are that he has virtually unlimited resources to check it out. And he knows that, if he makes a mistake in hiring you, the mistake is rather easily rectified.

However, if you make a mistake in your evaluation of the position or the company, you can be stuck with your decision, at least temporarily. And the odds are against you, because you probably have a limited knowledge of the company interviewing you. In fact, if you are seeking a position in one of the new growth areas—such as computer peripherals—you may not have even heard of the company that replies to you.

But to make the hiring game a better gamble for you, there are certain sources of information that can help you to learn almost as much about your potential employer as he learns about you.

There are two phases to the investigation you should undertake:
- Determining where the company is going and how fast; what the chances of success are.
- Determining whether or not a particular company has a future for you, personally; if it is the kind of place where you want to work.

The annual report

Much information about a company’s operations is a matter of public record. However, corporate policies, internal procedures, management attitudes, and real working conditions are not published information. Investigation and interpretation are required on your part.

The best place to start finding out about a company is its annual report, which will be available if the company’s stock is publicly traded. A stockbroker will be able to show you a copy, or a businesslike letter from you to a company officer will usually produce a copy, if you state that you are a potential investor.

A professional financial analyst can read as much information between the lines of an annual report as he can from the published details of operations. Although you can’t expect to do as good a job as a professional analyst, your observations will give you a pretty good idea about long range company plans.

A recent ELECTRONIC DESIGN article gave seven major keys to financial analysis, as outlined in a New York Stock Exchange booklet. For maximum benefit, you should study a five-year financial record, if possible, to determine trends and long-range plans. The seven keys to financial evaluation of an annual report are:

1. Pre-tax Profit Margin. This is the ratio of operating profit (before interest and taxes) to sales. An upswing in sales usually widens the profit margin.

2. Current (working capital) Ratio. A gradual increase in the ratio of current assets to current liabilities means improved financial strength—a company able to take advantage of expansion opportunities.

3. Liquidity Ratio. The ratio of cash and marketable securities to current liabilities (sometimes expressed as a percentage) indicates a company’s ability to meet current obligations.
and to pay larger dividends. This ratio is often lower during a period of expansion or rising prices. A protracted decline can indicate that a company will have to raise additional capital to achieve expansion plans or to enter new markets.

4. Capitalization Ratios. These are the percentages of the total company investment allotted to each type of debt, stock, and surplus. A higher ratio of surplus to common stock means that the common stock is strong since there are fewer claims on corporate income in the form of debt securities or preferred stock.

5. Sales to Fixed Assets. The ratio of annual sales to the value of plant, equipment and land before depreciation and amortization. A sizable expansion in facilities should lead to increased sales.

6. Sales to Inventories. (Commonly called “inventory turnover.”) This ratio is computed by dividing the year’s sales by the year-end inventories. A high ratio indicates good merchandising policies. A sudden lowering indicates the possibility of an inventory tied up in possibly obsolete products.

7. Net Income to Net Worth. Derived by dividing net income by the total of preferred stock, common stock, and surplus accounts. This is an indication of the company’s earnings on the stockholder’s investment. An increasing ratio trend is favorable.

Complete the analysis

Naturally the figures derived for a particular company must be tempered with several other observations such as: (1) the state of the particular industry in general; (2) the condition of this company’s competitors; and (3) your own objectives. For instance, are you more interested in steady, stable employment or in gambling on a rapidly rising company?

Dun & Bradstreet and similar financial reports contain information about the projected financial success of a listed company. These are excellent sources for information about new, small companies that are not publicly traded, because they give key background about the owners, management, and capitalization.

Securing one of these comprehensive reports requires a good contact, such as your banker, and you may be required to pay for the service. However, if you contemplate going to work for a small, new company, organized and managed by people you do not know, consider the fee a good investment.

Would you want to work there?

Having determined whether or not the prospective company is what you are looking for in terms of your career needs, you should then determine what life with that company would be like for you. Besides your own personal questioning of both recruiting and technical people during a company interview, information about the internal policies and operations of a company may be gathered from the following sources:

Professional Colleagues. You probably belong to a professional society. One or more of your colleagues probably has some knowledge about any given company. If possible, also, ask the company’s vendors, customers, and competitors how they rate your prospective employer. An even better source is a man who currently works for the company. It’s true that a satisfied employee is a company’s best recruiting ad.

The Community. Today many electronics companies are located in small towns and suburban areas. When you travel there for an interview, talk to as many non-company people as you can. This includes airport personnel, cab drivers, service-station attendants. If a company has been around for a while, and has a mature, community-minded management, most local people will have a positive opinion about it. Also check the local paper. (You’ll need to pick up a copy anyway, to check housing and food prices, and local recreation facilities.) See if the paper carries any mention of the company personnel and their involvement in the community. If the company is...
expanding it might be running local ads for recruiting factory personnel. If so, observe what they promise in benefits. Also, contact the local chamber of commerce for literature. This material will tend to tell you how much influence the company has in local affairs and plans.

Your Prospective Employer. Some questions are best answered on the spot by the recruiting interviewer (concerning company policy) and by the technical administrators (about working conditions). But that does not always ensure you against receiving incomplete answers. Some recruiters are not very candid. Always keep in mind, however, that you are entitled to ask any pertinent questions.

Exercise your right to inquire

Support Personnel—What is the approximate ratio of nontechnical to technical personnel? A high ratio means that you’ll probably have to spend less time on non-engineering work. In other words, count the technicians.

Professional Societies—Does the company encourage participation in professional societies? Do they pay dues and expenses? What is company policy in regard to trade-show attendance? What are travel policies? Is publication of papers and articles encouraged? How many members of engineering management are active in local professional-society leadership? Too many negative answers could mean that the company is not concerned about individual requirements.

Reference Material—Is the company library well organized? Is there a full-time librarian? Are there microfilming and duplicating facilities?

Management Training—Does the company have any, formal programs for management training or personnel development?

Continuing Education—What are the policies for continuing education? Time off for classes? Full or partial tuition reimbursement? How many company employees teach at the local college or university?

Internal Communications—What employee communications are available? Are publications designed to keep all employees well informed of the company’s over-all goals and accomplishments? Is there an internal engineering newsletter for dissemination of design information?

Physical Conditions—Are normal working conditions better than what you have now? Well lighted? With relatively quiet separate offices, or a large “bullpen”?

Job Potential—It’s important to find out how high one can go within a particular company and still practice engineering. In some situations, a man must switch from engineering to management if he desires to advance beyond a certain point. In other companies, line responsibility for engineering extends into top management. Some companies permit older, competent engineers without desire for management duties to fill specially created “assistant to the chief engineer” or “consultant” positions.

These positions are usually more predominant in companies heavily engaged in R & D activities, and such positions are obviously limited in number. Their presence indicates, however, that the company has recognized design competence enough to reward it. It is also interesting to note the percentage of sales management and top management team members who started with the company as design engineers. Although your planned career path may not include sales or corporate management, it is worthwhile to discover if such career paths exist.

Replacement Policies—Companies in some “cyclical” industries, such as the aerospace industry, cooperate in placement programs when massive layoffs result from contract cancellations. For instance, if an aerospace company loses a large contract (as happens when Congress cancels a defense hardware program) the company is faced with the prospect of laying off a large number of professional, technical, and skilled employees. It then contacts all logical prospective employers for these people and offers assistance in their recruiting. It will set up offices for interviewing within its plant, and will supply employment records and references to meet stated requirements of the recruiting companies.

At first glance, this seems a strange way for competitors to operate; however, in the aerospace industry it seems to work out well. Companies get a chance to hire professional people easily and at reasonable cost; the personnel that are laid off get an opportunity for continuous employment; and the company, of course, assumes that when fortune smiles upon them again, they will be able to rehire the same employees in the same manner.

Switch, don’t fight

Today a properly designed engineering career includes an infrequent, but calculated, job change. According to a recent ELECTRONIC DESIGN survey, electronics engineers reported having an average of three jobs per career. In the computer industry, engineers with 16 to 20 years’ experience reported having an average of over five positions per career. It’s important to prepare yourself psychologically for changing jobs. Other engineers are making changes, too.

And remember—when you decide that your objectives demand a change, consider any job offer you receive as a special evaluation for a most important client: You.
They're new, Molex edge connectors. For printed circuit boards. Terminals crimped to wires automatically. We have straight-in and right-angle types. With and without mounting ears. It’s another giant step by Molex in helping create high-speed, low-cost devices that simplify circuitry. Reliable? You bet. The connector has bifurcated terminals that provide solid contacts. Yet you can slip the connector on and off many times without damaging printed circuits. And it’s not a preloaded unit. Carries only contacts required. From nine to twenty-two.

If you want to save assembly time, steps and money, take a close look at this new Molex edge connector. For free samples, write or you can make connections by calling (312) 969-4550.
Inexpensive generator produces triangle and square waves

The inexpensive function generator shown develops both triangular and square wave outputs. The circuit was designed for maximum efficiency and triangular linearity with a few parts.

The transistors Q₃ and Q₄ form a differential amplifier with a constant-current generator created by the emitter junction of Q₄. Positive feedback via buffer transistor Q₂ forces the differential amplifier to act as a threshold detector with a large amount of hysteresis. The lower level sensed is always ground, whereas the upper level (+V) is adjusted by R₅. Q₁ is a gated current source. Q₄ is a constant current sink.

When Q₄ is ON Q₃ is OFF and Q₂ forces the base of Q₃ to sense a +V level. Current source Q₁ supplies sufficient current to charge timing capacitor C₁ linearly toward +15V. When this ramp reaches +V, Q₃ turns ON, Q₄ turns OFF

Low component count function generator simultaneously produces triangle and square waves.
Signal and system analysis at a glance.

Compare data streams and records. Characterize noisy, random signals. Detect periodic signals buried in noise. Identify vibration sources in structures and isolate different transmission paths and times. Completely characterize components in complex systems by impulse response measurements and frequency spectral analysis.

You can do all this and more with Hewlett-Packard's new all-digital 3721A Correlator - on-line, and at a price you can afford.

It's a powerful, portable signal analyzer. It offers cross-correlation for comparison of two signals in noise, without a sync pulse. Auto-correlation for comparison of a signal with itself. Signal recovery. And statistical probability measurement.

And it's as easy to use as an oscilloscope.

The time span across the CRT can be varied from 100 µS to 100 seconds (to infinity with external clock). Maximum resolution is 1 µS. An optional delay offset facility enables you to look at up to 1000 points of time scan. And a unique quick look feature gives you an almost immediate indication of the final value of the function being computed.

Remember, HP's 3721A is all digital. This gives you tremendous averaging versatility and power. The averaging time constant is changed at the flick of a switch — over a range of 36 milliseconds to over 100 days. And for maximum convenience, our new correlator can be interfaced directly to a computer for frequency spectrum analysis and other types of data manipulation.

The price? Just $8525. For comprehensive signal and systems analysis at a glance, call your Hewlett-Packard representative. Or call or write Hewlett-Packard, Palo Alto, California 94304; Europe: 1217 Meyrin-Geneva, Switzerland.
and the current source Q₄ shuts down. The timing capacitor C₁ is now discharged linearly by current sink Q₅. When the discharge ramp reaches ground the charging cycle repeats, thus forming a triangular output across C, while providing a square wave output at the base of Q₃. Symmetry adjustment is accomplished by setting Rₛ, which controls the C₁ discharge rate.

Any low-leakage capacitor may be used for C₁. By changing C₁, the frequency of the circuit can be adjusted from 0.01 Hz to 200 kHz.

William E. Peterson, Associate Engineer, ITL Research Corp., Northridge, Calif.

VOTE FOR 311

Symmetrical power supply is adjusted with only one control

With the growing use of linear integrated circuits, the need for symmetrical negative and positive power supplies is quite common. The positive and negative supply voltages should track each other precisely, and it is convenient to simultaneously adjust both voltages by using a single control.

The positive supply shown in the figure is conventional. Integrated-circuit amplifier A₁ detects the error voltage and provides compensation with drive to the series transistor Q₂. Stable, low-noise operation of the zener reference diode D₅ is made possible by the presence of FET Q₄, which acts as a constant current source. Residual zener-diode noise is further reduced by the integrating circuit R₃ and C₄.

The negative supply is also a series regulator. One input of the operational amplifier A₂ is held at ground potential, and the other input sees the voltage at the summing point of R₅ and R₆. A₂ acts to maintain this summing point voltage at zero, which results in a symmetrical negative output voltage. If the offset voltage error of A₂ (always less than a few millivolts) is suitably compensated, the output voltage is symmetrical within the precision of the divider R₅ and R₆.

Symmetrical power supply uses two ICs and is controlled by one potentiometer.
For your op amp applications that call for both economy and quality, we’ve karate chopped prices on three of our most popular devices.

**Ch'op amp prices on Bipolars:**
ADO47/10 (H6010C) now only $10.50
5 V/V°C Drift, Typ
100 nA Input Bias Current
100 dB Common Mode Rejection Ratio

**Ch'op amp prices on FETS:**
ADO54/10 (H7040C) now only $11.50
100 dB DC Voltage Gain, Min
100 pA Input Bias Current, Max
60 dB Common Mode Rejection Ratio
6 V/μsec Slew Rate, Min
75 μ volts/°C Drift, Max* 50 μV/°C and 25 μV/°C available on special order

**Ch'op amp prices on Chopper Stabilized Units:**
ACS10 only $83.00
140 dB Open Loop Gain, Min
6 V/μsec Slew Rate, Min
0.5 μV/°C Drift, Max
25 pA Input Bias, Max
Short Circuit Proof

Our monolithics are priced even lower.
This power supply delivers ±8 V/±100 mA. Output voltages can be adjusted ±15% from nominal. Although simple and economical, this circuit displays excellent performance. For a simultaneous ±15% input voltage variation and a 0-100% load variation, output voltage remains within 400 µV of its nominal value. Output noise (worst case) is less than 15 µV rms, and dc output impedance is less than 10⁻¹ ohm up to 30 Hz. From this frequency upward, it rises 6 dB/ octave.

This supply is unconditionally stable with any kind of reactive load; thus it is possible to parallel both outputs with 1000-µF capacitors. Output noise is then reduced to 5 µV rms, and output impedance remains less than 0.1 ohm at any frequency.

Jean-François Delpech, MS, DSc, Institut d'Électronique, 91-Orsay, France

**Ordinary 3 × 5 index card makes a handy ruler**

A simple way to make approximate measurements when no ruler is handy is to use an ordinary 3 × 5-inch index card folded as shown. With just two folds, 1, 2, 3, 4 and 5-inch measurements can be made. If you make it a habit to carry a few of these cards for note taking, a ruler suitable for making rough estimates is easily constructed.

First, fold the lower left corner on a diagonal so that the left edge coincides with the top. Next, fold the piece on the right in half.

When the card is unfolded, the creased edges will provide five different increments, as shown in the diagram.

_Ruby G. Lowenstein, Designer, Hampton Bays, N.Y._

**Electronically tuned notch filter uses FET as a resistor**

The resonant frequency of a twin-T notch filter can be varied continuously over a selected frequency range with the aid of FET switches in the resistive arms. This results in an electronically tuned notch filter.

The FET switches are driven from a variable-frequency generator with fixed pulse length. Variation in generator duty cycle will change the effective resistance of the notch filter resistive arm so that the effective resistance increases with switching frequency. Unit-to-unit variation between FET ON impedances is about 150 Ω. Circuit sensitivity to differences in FET ON impedance is reduced by making the notch filter resistive arm values about 30 times greater than 150 Ω. With a view to retaining this same ratio in the upper resistive arm, a paralleled FET combination is used.

The twin-T filter shown in Fig. 1 has a notch frequency that can be varied from 30 to 800 Hz.
A complete 8-bit Digital-to-Analog Converter for $75!

The new Helipot Model 845 is a thick-film, miniaturized hybrid digital-to-analog converter (DAC) that converts an 8-bit binary word into an analog output. The input gates, switches, resistor network, reference voltage, and output amplifier are all in the hybrid module. Because of its operating temperature range (−20°C to +85°C), Model 845 can be used for any industrial digital-to-analog conversion, process control being a typical application. Price is $75/unit in 1-9 quantities (less in greater numbers). The package size is 1.0 inch x 1.5 inches x 0.170 inch. The unit accepts an 8-bit, parallel, binary word that is TTL- and DTL-compatible, and an enable gate is provided. Four different output-voltage ranges are available as standard models: two unipolar (0 to +5 v, 0 to +10 v) and two bipolar (−5 to +5 v, −10 to +10 v). Power-supply requirements are +15 v at 80 ma and −15 v at 10 ma. The output accuracy is ±½ least-significant bit at 25°C ±1 mv per percent of supply-voltage variation. The output-current range is 0 to ±2.5 ma, and the output slew rate is 0.3 v/μsec. And, it's available from stock.
High-speed zero crossing detector uses tunnel diodes

A tunnel diode and a differential amplifier can form a high-speed zero crossing discriminator with broad dynamic range, high input resistance and high input sensitivity.

For the circuit shown in Fig. 1, the collector currents of Q₁ and Q₂ are equal when the input signal is zero. When a negative input signal is fed to Q₁, Ic₁ decreases and so does Vc. When Vc₁ = E₁ (switching voltage) the tunnel diode switches from the high to the low voltage state. A further increase of negative input signal lowers the tunnel diode voltage. When Q₁ is cut off, Vc₁ is zero.

For this particular network the switching pulse length was fixed at 2.5 µs, and the frequency adjusted over the range 10 to 200 kHz; the lowest switching frequency being more than 10 times greater than that of the highest frequency handled by the filter. The resonant frequency for the filter is given by:

\[ f_0 = \frac{1}{(2\pi RC)} \]

A low-pass filter can be connected at the network output to remove the effects of the switching frequency. The frequency response of the notch filter is shown in Fig. 2. To obtain a smooth continuous sweep of the notch frequency, the FET switches may be driven from a voltage/frequency converter, which in turn is driven by a voltage ramp generator.

Stanley Summerhill, Design Engineer, Servette, Geneva, Switzerland.

If two matched emitter-base breakdown protection diodes (D₁ and D₂) are provided, the input signal can exceed the emitter-base junction breakdown voltage of Q₁, but offset will be prevented.

For the trailing edge of the input signal, Q₁ is turned on, and collector current increases. When I₁R equals E₁ (threshold voltage) the tunnel diode switches from the low to the high voltage state. This switching corresponds to low-level discrimination.

If both Q₁ and Q₂ have tunnel diodes in their
Krohn-Hite's Series 4100 Rack-Mounted Solid State Programmable Oscillators are the new generation of medium-priced, precision general purpose oscillators. They combine the convenience of automatic programmed frequency and amplitude selection with the outstanding performance characteristics of the popular Model 4100 Push-Button Oscillator. Covering the frequency range of 0.1 Hz to 1 MHz, Series 4100 Programmable Oscillators boast a frequency calibration accuracy as low as 0.1%.

Available in four models, Series 4100 Oscillators are designed for either standard manual operation or automatic programmed frequency or amplitude selection by any one of several commonly available means, such as computer output, punched cards, punched tape or computer mag tape. Programming format is the standard 1-2-4-8 binary coded decimal system. A unique feature of the Series 4100 Programmable Oscillators is the capability to produce both sine and square wave outputs with 1/2 watt of power into 50 ohms with remote or local frequency control. Best of all, Series 4100 provides a degree of frequency stability, low distortion, and amplitude stability that can't be matched by competitive units.

The following chart provides a brief rundown of the important operating parameters of the new generation Series 4100 Solid State Programmable Oscillators. And don't forget the model 4100A non-programmable oscillator is still available at $550. They're all products of the recognized leader in variable filters who's out to make waves in oscillators, too. For complete technical information on any of these new Krohn-Hite Oscillators, write THE WAVEMAKERS: Krohn-Hite Corporation, 580 Massachusetts Avenue, Cambridge, Massachusetts 02139 U.S.A.

Tel: (617) 491-3211 TWX: 710-320-6583

collectors, the circuit can be used to discriminate zero crossings of an alternating input waveform, as shown in Fig. 2. In this case, the threshold voltages $E_{th1}$ and $E_{th2}$ can be adjusted independently. After differentiation, the $Q_1$ and $Q_2$ collector voltages are fed to the input of a flip-flop.

With a 5 mA Gallium Arsenide tunnel diode, 5 mV sensitivity was obtained.

*Marin Sampaleanu, Design Engineer, Institute of Atomic Physics, Bucharest, Romania.*

**Chart speeds the design of single-layer air-core coils**

The use of a chart simplifies the design of air-core inductors. This is true in cases where the coil radius winding pitch (turns per inch) and required inductance are known. Such cases arise when commercial coil stock is used, or when a coil is to be wound with known pitch (such as close spaced) on a form of known radius.

Use of the chart is most easily accomplished with a pair of dividers. From the calculation of step 1, fix one point of the dividers at $x$ on the X-axis. From vertical intersection with proper radius curve, place the other point at $y$ on the Y-axis. Swing the arc from $y$ around to the X-axis to obtain coil length on the X-axis.

As shown in the figure, the coil length is determined directly from the curves. The length of the coil is given by

$$
\ell = X + \sqrt{X^2 + Y^2},
$$

where

$$
X = \frac{5L}{r^2n^2}
$$

and

$$
Y = \sqrt{1.8rX}
$$

The formula for $\ell$ is derived from the formula

$$
L = \frac{r^2n^2}{9r + 10\ell}
$$

In this case, the total number of turns ($N$) is simply written as $nt$. The original formula for $L$ is accurate within 1% for $\ell \leq 0.8r$.

*Arthur N. Boyars, U.S. Naval Ordnance Laboratory, Silver Spring, Md.*

*Design chart for air-core inductors reduces the work involved in calculating coil dimensions.*
How can such a little guy uphold the family reputation?

Our new 561/562 series are true Squaretrim® potentiometers down to the last quarter inch. As the smallest members of this distinguished family, they have to live up to a bigger reputation than other pots their size. They do. We made sure.

We gave them the same high quality element that makes our military pots so reliable... the same light ±5% tolerance... the same wide 10 ohms to 20K standard resistance range and -55°C to +150°C temperature range. We even designed them to meet all environmental requirements of MIL-R-27208, like their larger military brothers.

Models 561 and 562 ¼” Squaretrims are available in three configurations, top or side adjustable, and they give you a generous 13:1 adjustment ratio. You wouldn't expect a general-purpose pot to have all these features and still be reasonably priced. But it's just another example of how our Squaretrim family supports its reputation as the biggest name in value for the smallest thing in pots.

They're in stock now at Weston Potentiometer distributors. Or ask us about special resistance values, data sheets, evaluation samples. The little guys.

WESTON COMPONENTS DIVISION, Archbald, Pennsylvania 18403, Weston Instruments, Inc. a Schlumberger company
Regardless of what they are called, McCoy Electronics Co. makes available the most complete offering of multi-electroded devices in the industry. From 5 to over 200 MHz, both crystal and filter technologies are combined to provide you assurance of competence, quality and reliability. We engineer and fabricate...

Do you know about the MOD line...?
If you are a communications design engineer you need to know. If you are working in the areas of VHF, UHF, microwave on up through light frequencies you need to know. If you are amplifying, transmitting, receiving, oscillating, filtering, measuring or almost anything at these frequencies you need to know. Many engineers are discovering the new MOD line... How about you?

The MOD line includes the products and services of the Fairchild Microwave and Optoelectronics Division (MOD). The products you need to know about are:

- high frequency transistors
- hybrid amplifiers
- microwave sources
- optoelectronic sensing and emitting devices

Many engineers have found that these products make their design jobs easier and can lower their circuit or system costs.

You, our customer, and your needs make service an important part of the MOD line... We have a motto that explains our position on service: "Your requirements come first at Fairchild Microwave and Optoelectronics Division (MOD)." Many engineers have accomplished their design objectives faster and more efficiently because of our service.

You need to know about the MOD line...
If you haven't received your copy of the MOD line catalog circle reader service number 1. Keep your eye on number 1 because in future months it will bring you important information about new products. Number 1 is... The MOD line... circle it today.
Send for our new Logic Handbook. It tells you
what, why, and how to build logic systems from modules.
But, alas, not how to build the modules themselves.

INFORMATION RETRIEVAL NUMBER 173


This Product Source Directory, covering Random Noise Generators, is the ninth in a continuing series of product selection data that will list comparative specifications and prices for products frequently purchased by design engineers. All categories will be arranged according to some primary parameter so that items having similar functional capabilities can be instantly compared.

How to use the tables
The tables in this section list the specifications for random noise generators. The following abbreviations apply to all instruments listed:

n/a—not applicable

An index of models by manufacturer is included at the end of each table.

For each table, the instruments are listed in ascending order of one major parameter. The column containing this parameter is color-coded white. Manufacturers are identified by abbreviation. The complete name of each manufacturer can be found in the Master Cross Index.

### Sweep Generator Addendum

The sweep generator (ED 25, December 6, 1969) product source directory listing Kay Electric products is replaced by this addendum.

We'll hybrid thick-film your circuit in our new ¼" x ¾" flat pack, and get you into some tight spots.

Getting you into tight spots is one way of getting you out of them. For now you can design your circuit confident that everything will fit. And we can produce that custom circuit flawlessly.

Our exclusive ¼" x ¾" T3 configuration enables you to do just about any thing with the available area. Because of its unique dimensions, because it comes in 3 basic variations.

With all 14 leads coming out of one side, it can lay flat or stand. It is also available with leads on both sides. Or, in a dual in-line configuration. Name it. You've got it. Just about.

But we've got more than just a nice new shape for you. We have the facilities to produce prototypes or large quantities fast. In a high reliability environment. Our people, materials and equipment conform to the highest standards. For instance, Mil-Std-883. We test, check and counter-check. And our clean rooms provide the optimum production atmosphere.

What's more, if you need it, we'll help you solve design problems.

We can produce your design in our ¼" x ¾" hybrid thick-film flat packs now. Find out how it can fit into your plans. Write or call: Columbia Components Corporation, 60 Madison Avenue, Hempstead, New York 11550 (516) 483-8200. On the West Coast: (213) 272-9525.
Have the best of choices.
Try IMC's newly patented Tormax 200.
It's directly swappable with the other one.
Steps in 1.8-degree increments at rates up to 550 steps/sec.
Turns at 72 rpm from a 60-Hz input.
Backed by IMC's extensive stepper design and manufacturing capability.

Available immediately in standard models.
A little longer for dual shafts, splines, keyways, different mounts, and so forth.

Coin-sized electrochemical storage device gives 50-F capacitance with 0.5-V rating

Gould Ionics Inc., P.O. Box 1377, Canoga Park, Calif. Phone: (213) 341-1040. P&A: $50; 2 to 4 wks.

Called an energy storage device (ESD), a new electrochemical capacitive component bridges the gap between a conventional capacitor and a secondary battery. About the size of a one-half dollar, the ESD attains capacitances of about 50 farads with an approximate internal resistance of 1 to 2 Ω.

The new device is made of pressed powder wafers and is currently intended for straight dc applications. It makes possible sample-and-hold circuits that can store information for weeks. Other applications include integrators for industrial control and standby power supplies for electrically volatile avionics memories.

Because of the magnitude of its capacitance and internal resistance, this poker-chip-sized component exhibits a very long time constant. This means it can retain charge for long periods of time—one ESD for example, was charged in June, 1969 and still retains over 96% of its energy today.

A single ESD, or cell, has a voltage limit of 0.5 V. However, higher voltages can be obtained by stacking the cells in series.

Each cell contains two electrode wafers separated by an electrolyte wafer. The high capacitance is due to the maximization of the electrode electrolyte interface area in structures of a finely divided blend of carbon and the electrolyte.

Evaluation units are available with either a 0.5 or 1-in. dia.

COMPONENTS

Self-Organizing Systems, Inc., P.O. Box 9918, Dallas, Tex. Phone: (214) 276-9487. Availability: stock.

Mounting directly on PC boards, series 545 Chemtron reed relays hold thermal emf to less than 3 µV across their contacts at 100% duty cycles. The new units feature electrostatic shielding, magnetic shielding, and IC-driven 4.5-V coils. They are available with one, two or three-pole normally open contacts and 12-V coils for transistor drivers.

CIRCLE NO. 366

Lamps, Inc., 17000 South Western Ave., Gardena, Calif. P&A: from 60¢; 4 wks.

Claimed to be an industry first, a new type 253 subminiature lamp projects a critically focused lens-end beam. Its design uses a straight-sided glass envelope—T-1-1/4 from lens-end to base—aligned in a T-1-3/4 base to assure perfect fit. Measuring 0.2 in. in dia and 0.69 in. in length, the new lamp is rated at 2.5 V and 35 A, ±10%. Its average life is said to be 10,000 hours.

CIRCLE NO. 367

Chicago Miniature Lamp Works, 4433 N. Ravenswood Ave., Chicago, Ill. Phone: (312) 784-1020.

Designed for applications requiring illumination from low-current sources, a new line of T-1 subminiature lamps offers a maximum rating of 30 mA and an average current range from 20 to 25 mA. These fine-wire-filament units are aged for 16 hours to insure long lamp life and dependable operation. They can be driven directly from low-output integrated circuitry.

CIRCLE NO. 368

Vitramon, Inc., P.O. Box 544, Bridgeport, Conn. Phone: (203) 268-6261.

A line of EIA-standard-size chip capacitors is now available: the VJ0805 (0.08 x 0.05 in.), the VJ1805 (0.18 x 0.05 in.), the VJ1808 (0.18 x 0.08 in.), and the VJ2224 (0.22 x 0.24 in.). These chips have a capacitance range of 10 to 470,000 µF in NPO and general-purpose dielectrics. Standard voltage ratings are 50 V dc at 125°C and 100 V dc at 85°C, and capacitance tolerances are ±5, ±10 and ±20%.

CIRCLE NO. 369

A new line of microminiature cermet chip resistors are now available in a variety of terminations for most bonding methods—including reflow soldering, thermal compression or ultrasonic bonding, strap reflow soldering, and eutectic chip attachment. Resistances can range from 10 Ω to 5 MΩ, with temperature coefficients of ±50, ±150 or ±300 ppm/°C.

CIRCLE NO. 370
It's not the computers we build. It's the problems we solve.

REDCOR has delivered, or has on order, more computer-controlled MOS test systems than all other manufacturers combined. In fact, nearly 80% of all MOS LSI/MSI devices produced in the upcoming years will be REDCOR-tested. Surprising, perhaps, but true. Why this vote of confidence from so many industrial giants? One reason is that we design and build, using state-of-the-art techniques, all the system components, including the computers. And we provide the systems engineering, the software, and the field service... a "one source, one responsibility" commitment. MOS testing may not be your application, but whatever your systems requirement, let a REDCOR Systems Pro solve it for you.

REDCOR CORPORATION
Telephone: (213) 348-5892

See our MOS testers in action at IEEE—Booth 2H 13
**28V DTL POWER GATE**

Problem: Find 28 volt 4-input DTL power gate immune to 80 volt transients.

Solution: The Siliconix H-100 Dual Power Gate, offers high AC and DC noise rejection and operates directly from 28 volt power supplies.

The H-100 was developed for use with noisy aircraft and marine power supplies; output drives 100 mA and sustains 90 volts. Available in TO-86 or TO-116 packages. Write or call today for the data sheet on the Siliconix H-100!

---

**COMPONENTS**

**Bounce-free switch works in any position**

Master Specialties Co., 1640 Monrovia, Costa Mesa, Calif. Phone: (714) 632-2427. P&A: from $14.27; stock to 3 wks.

Indicating position, a new alternate action push-button switch also serves as a non-electrical indicator of switch position. The series 800 Tellit switch has a lighted indication of switch mode when depressed to the ON position. If power fails, the lighted indication will cease, but the switch will remain in the depressed position.

---

**Push-button switch has alternate action**

Without requiring any intervening mechanical gears, a new dc servo motor can directly drive computer tape cassettes for digital data entry at speeds from 2 to 20 inches per second. The speed of this size 13 motor is controlled by the choice of oscillator frequency. Start times range from 3 to 8 ms, and speed control is accurate to ±3%.

---

**No-gear servo motor runs cassettes directly**

McLean Engineering Laboratories, P.O. Box 127, Princeton Junction, N.J. Phone: (609) 799-0100.

A new blower cuts audible noise to a whisper by using a solid-state motor control and a modulating thermostatic probe. For instance, if the unit senses the outlet air temperature to be 90°F, it operates at full volume to gradually cool the equipment. It then automatically decreases blower speed to maintain a constant cabinet temperature. Blower life is said to improve.

---

**Automatic blower senses temperature**

Fifth Dimension Inc., P.O. Box 483, Princeton, N.J. Phone: (609) 924-5990. P&A: $9; stock to 4 wks.

Able to operate in any mounting position, a miniature magnetically actuated limit switch features bounce-free performance for over 50 million cycles. Designated as model 3100 Logcell, this mercury-film device occupies only 0.015 cubic inch. Its contact resistance is less than 50 mΩ, and thermal noise is less than 1 µV. Load rating is 1 A at 6 V.
LED numerics slash price 40%

First introduced in 1968, Hewlett-Packard's 5080-7000 solid-state numeric indicator with integral decoder/driver now reflects price reductions as large as 40%. In quantities of 1000, for example, these LED numerics cost only $25 each as compared with a previous unit price of $42. For small quantities of 1 to 9, unit price is now $70, instead of $75.

CIRCLE NO. 375

Switch with 1.35-in. dia fits up to 24 positions

Grayhill, Inc., 561 Hillgrove Ave., La Grange, Ill. Phone: (312) 354-1040.

A new miniature 24-position rotary switch has a diameter of only 1.35 in. with a behind-the-panel dimension of 0.916 in. for a single-deck unit; each additional deck adds approximately 0.333 in. Model 53M15 is available with 1 to 12 poles per deck and with as many as 12 decks to a switch; a total of 12 poles is the maximum per switch. Resistive load ratings are 0.25 A at 115 V ac or 6 to 28 V dc.

CIRCLE NO. 376

Chip resistors get beam leads

IGE, P.O. Box 83, Watertown, Mass. Phone: (617) 879-5890.

Intended for hybrid and microwave circuits, new beam-lead chip resistors have tin-plated tabs for easy attachment. These 0.06 x 0.08 x 0.01-in. devices are available in standard ohmic values from 22 to 510 Ω. The chips withstand temperatures up to 200° C during circuit processing and up to 150° C for continuous operation. Temperature coefficients range from below 25 ppm to approximately 100 ppm.

CIRCLE NO. 377

A single capable source for both lamps and fiber optic light guide systems

There are obvious advantages in speed, cost and often in efficiency of the ultimate system in having one source produce both miniature lamps and fiber optic assemblies. Welch Allyn has that capability.

We are major suppliers of fiber optics and incandescent illumination sources to principal computer manufacturers and other light guide users.

In addition to our standard lamp designs, we have recently developed a new family of customized miniature vacuum lamps for fiber optic and photo-sensitive device applications with selectable lens-filament combinations and basing for optimum utilization of energy.

Our lamp-fiber optic systems are designed for maximum efficiency and are often less costly than standard multiple-lamp systems.

COMPONENTS

Coupled-mode filter responds with 6 poles

Ideal for matching solid-state circuitry in vhf/uhf communications receivers, a new six-pole coupled-mode quartz filter offers a center frequency of 5 MHz. The device has a 3-dB bandwidth of 14 kHz, and a 60-dB bandwidth of 70 kHz. Maximum insertion loss is 4 dB, ultimate attenuation is 100 dB, and spurious mode rejection is 90 dB. Other applications include telemetry, radar and aerospace radio systems.

CIRCLE NO. 378

Triggerable spark gap switches 3000 amperes

Designed for fast bipolar switching of high currents, a new miniature triggerable spark gap can switch up to 3000 A. Designated KAT 05-01, it transfers charges of up to five ampere-seconds per discharge and operates from 90 to 450 V. It is triggered by a high voltage pulse as short as 5 µs and requires only 10^-6 watt-seconds of trigger energy. It withstands transients without being damaged.

CIRCLE NO. 379
**Push-button switches eliminate bounce**

---

**Alcoswitch Div. of Alco Electronic Products, Inc., Box 1348, Lawrence, Mass. Price: $3.90, $4.25.**

Containing ceramic magnets, a series of new push-button switches allows switching with a light touch and features no bounce. The MSPM series of momentary-contact switches have glass encapsulated contacts and keyed non-rotating plungers. Contact bounce is 1 ms and ratings are 100 mA at 50 V dc. Available are two types: spst normally open and normally closed versions.

**CIRCLE NO. 380**

---

**Geared cam switches refine indication**

---

**Precision Mechanisms Corp., 44 Brooklyn Ave., Westbury, N.Y. Phone: (516) 334-5955.**

Able to be mounted like potentiometers, synchros or other size-11 rotating components, series GCS100 geared cam switches combine all the features of a conventional plate cam, follower and snap-action switch. They are intended for programming, counting, timing and angle position indication. Scale factors are 1:10, 1:100, 1:36 or 1:60 between independently adjustable switches.

**CIRCLE NO. 381**

**INFORMATION RETRIEVAL NUMBER 183**
Isolation was the only thing preventing a high-frequency Reed Switch Matrix Until now.

The Cunningham Reed Switch Matrix reduces high-frequency crosstalk and interference to a new low. Unique “sandwich” design seals, shields and separates matrix-mounted reed switches from their controls. Offers:

- **Excellent signal characteristics:** 50-ohm distributed. Broadband handling with top isolation. Low thermal noise.
- **100% Random access:** Any number or combination of crosspoints can be set, any place, any direction without affecting other crosspoints.
- **Computer compatibility:** Can be directly addressed by all computers using +5 volt logic. No added interfacing needed.
- **Proven reliability:** Up to 100 million operations.
- **Easy inspection and maintenance:** Control and signal sections can be separated for easy access.
- **Applications:** Interconnecting video channels; broadband data switching; test systems for nanosecond digital pulses; telemetry equipment for multiple data channels; antenna switching; medical data monitoring.

**SUBSIDIARY OF GLEASON WORKS**

**INFORMATION RETRIEVAL NUMBER 184**

---

**Broadband low-cost rf switch boasts tiny size of 0.025 in.**

**Mini-Circuits Laboratory Div. of Scientific Components Corp., 2913 Quentin Rd., Brooklyn, N.Y. Phone: (212) 252-5252. P&A: $40; stock to 3 wks.**

Systems and instrument designers in need of miniaturization can now avail themselves of a new low-cost miniature broadband rf switch in a TO-5 case that measures only 0.025 cubic in.

The model SB-1 50-Ω rf switch, believed to be the smallest unit of its type, is capable of switching 10-mW power levels with a compression of less than 0.2 dB over a wide frequency range of 10 MHz to 1 GHz.

It requires exceptionally low switching currents. Typical and maximum drive currents are 1 and 5 mA, respectively, over the entire operating frequency range.

Another outstanding feature is its high port-to-port isolation of better than 30 dB. Insertion loss ranges over a maximum of 1.5 to 3 dB for the ON state and 17 to 30 dB for the OFF state.

Specifications for the switching port include 5 mA of drive current, 120 Ω of nominal impedance and a standard positive polarity. Negative polarity is available on request.

Absolute maximum ratings include total input power of 25 mW and total input current of 25 mA to all ports over an operating temperature range of -65 to +100 °C.

The switch costs $16 for quantities of 100 to 999 units and $40 for quantities of 1 to 4 units.

Sockets at a cost of $1.50 and test fixtures at a cost of $55 are available.

**CIRCLE NO. 382**

---

**Spanning the frequency range of 10 to 1000 MHz, the model SB-1 low-cost miniature rf switch minimizes its insertion loss (1 dB typical) and maximizes its port-to-port isolation (over 30 dB typical).**
Sweep generator shows 4 curves

Spanning 0.1 to 1000 MHz with a harmonic content of less than 1%, the Polyskop III sweep generator can display four curves on its screen at the same time. The unit is suitable for all frequency-response measurements on two- and four-terminal networks within its range. Its output voltage is controlled by two attenuators with six 10-dB and ten 1-dB steps.

Continuous He-Cd laser emits deep-blue wave

University Laboratories Inc., 733 Allston Way, Berkeley, Calif. Phone: (415) 848-0491.

With an output wavelength in the deep-blue region at 4416 Å, a new internal-mirror continuous helium-cadmium laser develops an output power in excess of 2 mW with a beam diameter of 0.9 mm and a divergence of 1 milliradian. Model 416 operates from a dc plasma discharge containing vaporized metal cadmium in an atmosphere of helium gas. Required input is only 175 W.

McLean's performance curves are something to get excited about just the same. A talented computer resolves Precision Instrument Motor problems that just can't be handled by ordinary motor manufacturers — plotting curves that relate motor RPM to shaft torque, power factor, and percent efficiency. Blowers and Motors are computer-matched and built for highest performance and guaranteed for 25,000 hours of operation. Write or phone for some exotic, but understandable, information.

INFORMATION RETRIEVAL NUMBER 185
S-band transistors gain 3 dB at 5 W

Sealectro Corp., RF Components Div., 225 Hoyt St., Mamaroneck, N.Y.

A new Type N dual-channel Y adaptor provides simultaneous two-frequency transmission and reception without crosstalk or rf leakage, from dc to 2 GHz. Designated as ConheX 57-086-0019, the device is a hermetically sealed airborne-type assembly with a maximum VSWR of 1.08:1 through each channel. It meets the requirements of MIL-C-71, MIL-C-22557, and MIL-C-39012.

Dual-channel adaptor silences crosstalk

Varactor-tuned source ends spurious outputs

American Technical Ceramics, 1 Norden Lane, Huntington Station, N.Y. Phone: (516) 271-9600.

Designed for use in phased-array radar applications, series ATC-PAC capacitors can handle 20 A of cw power at 175 MHz, 50 A of pulsed rf power at 500 MHz, and 1 kW of power at S band. The devices, which have an rf voltage rating of 1000 V, are composed of dense fused porcelain, rather than sintered ceramic. They are tiny 1/8-in. cubes.

Porcelain capacitors sustain 1 kW in S band

Diode amplifiers take 250 mW cw

International Microwave Corp., 33 River Rd., Cos Cob, Conn. Phone: (203) 661-6277.

Without sacrificing noise-figure level, a line of microwave tunnel-diode amplifiers can withstand up to 250 mW cw of rf input power with no permanent degradation of performance. A typical unit covers the frequency range of 4.4 to 5 GHz with a gain of 21.5 ± 1.5 dB and a noise figure of 4.2 dB. Gain variation, for temperatures from -32 to +71°C, is +0 dB and -3 dB.

S-band amplifiers are microwave ICs

RHG Electronics Laboratory, Inc., 94 Milbar Blvd., Farmingdale, N.Y. Phone: (516) 694-3100.

A new line of uncooled MIC parametric amplifiers feature a noise temperature of 100°K. Known as the PAR series, the units cover frequency ranges from 1 to 8 GHz with bandwidths to 500 MHz. A double-balanced design on an alumina substrate provides high local-oscillator-to-rf isolation from the built-in avalanche-diode pump source. The units weigh under 2 lb.
The company you gave up looking for.

If you're as good as you think you are, we have several dozen new jobs that need doing in semiconductors, controls, graphics, instrumentation, optics, microwaves, chemistry, aerospace research, electrometrics and just about any other corner of tomorrow.

The thing that separates these jobs from all the others is the company you'll keep. Because the company is Fairchild.

The people who work at Fairchild are here because Fairchild has created the kind of organization they almost gave up looking for. An organization that knows its future is directly related to their potential. An organization whose interests span ten interrelated technologies, demanding the uncommon ability to grow rapidly and change direction quickly.

If you possess a sound knowledge in your discipline and an awareness of the practical economics of technical management, we invite your inquiry.

Write to Michael D. Hawkins,

Fairchild Camera and Instrument Corporation, 464 Ellis Street, Mountain View, California. 94040.

An equal opportunity employer.
Solid-state memories cost less than 2¢/bit

Cutting costs below that of drums, discs and cores, a new family of memories features block transfer rates as fast as 16 megabytes per second and costs as low as 1.2¢ per bit. The new memories are offered in two packages: the SSU (Semiconductor Storage Unit) line in upright cabinets, and the mini-SSU line in 19-in. racks for free-standing housings.

Storage capacities for the mini-SSUs can be 262,144 bits, 524,288 bits, 1,048,576 bits or 2,097,152 bits. Their respective block transfer rates are 8, 16, 32 or 64 megabits per second, with readout widths of 8, 16, 32 or 64 bits. Prices range between 1.64 to 2¢ per bit and 1.2 to 1.6¢ per bit.

These smaller SSUs are expected to have an impact on the peripheral market for uses like storage, buffering or memory extension. Their access times are said to be 30 to 60 times faster than discs or drums.

There are three full-size SSUs offering storage capacities of 2, 4 or 8 megabytes, at costs ranging from 1.46 to 1.98¢ per bit. They are random-addressible systems with block transfer rates up to 16 megabytes per second and access times in the order of microseconds.

Cassette record head reads after writing

Nortronics Co., Inc., 8101 Tenth Ave. North, Minneapolis, Minn. Phone: (612) 545-0401. P&A: $150; 8 wks.

A new read-after-write cassette recording head provides immediate verification that the equipment is writing properly. The unit is available in a single-channel (model WR1R) or a dual-channel (model WR2R) version. It permits reduction in core memory storage, provides faster process times, and eliminates the need for ultra-critical precision in tape backup.

CIRCLE NO. 395

Attache-case terminal talks computer lingo

Built into an attache case, a new portable audio terminal allows users to enter alphanumeric information into a System/360 computer and get computer-compiled spoken responses to their inquiries. Model 2721 operates for at least eight hours on rechargeable batteries, or can be plugged into any 110-V ac line.

CIRCLE NO. 396

L.E.D. INDICATORS

New! Solid State—Infinite Life!

TEC takes the latest technology and gives it practical application. We've built an easy-mounting line of subminiature indicators and switch-indicators, using the new L.E.D. (light emitting diodes).

They're tough. The red-emitting L.E.D. light source gives infinite life and reliability, resistance to shock and vibration, avoids catastrophic failure.

There are two-terminal models operating from a 5 VDC supply and transistor controlled models—which interface directly with RTL, DTL and TTL microcircuit logic—operating from signal levels of: ON: +2.5 to +10 VDC, OFF: 0 to +0.8 VDC.

All models rear-mount in a ¼” hole on ½” centers. They feature fast switching capability, three lens color choices (transparent red, transparent amber and clear) and the easy installation you expect from all TEC-LITE indicators. As low as $3.55 in 100-499 quantities.

For full information on the SS Series—or our complete line of display/control products and systems—write: TEC, Incorporated, 6700 So. Washington Avenue, Eden Prairie, Minnesota 55343.
A UNIQUE CERAMIC VARIABLE CAPACITOR

Unique is the word that best defines the Modutrim—microminiature capacitor series. The MT series offers the design engineer superlative stability due to a special rotor designed by JFD. The rotor stability is due to a special proprietary ceramic material in a monolithic structure.

Especially designed for micromodule and hybrid applications, Modutrim is available in a wide range of C\(\Delta\)s with electrical characteristics that are outstanding for components of this exceptional small size.

Offered in 5 basic mounting configurations the Modutrim (MT100, 200, 300, 400 and 500) provides an optimum choice for your design applications.

In addition, JFD has modified its MT300 and MT400 series to provide added strength without affecting the mechanical or electrical parameters.

MT capacitors meet or exceed MIL-C-81.

JFD engineers are available to meet your design requirements.

DATA PROCESSING

Parallel data modem takes 8-level inputs

General Data Comm Industries, 537 Newtown Ave., Norwalk, Conn. Phone: (203) 847-2445.

Designated as the GDC-402C, a parallel-input simplex modem accepts 5, 6, or 8-level tape reader inputs (paper or magnetic) and converts the data to parallel tones for transmission over the public telephone network. The modem transmits nine tone channels in parallel, eight data channels, and one timing channel. Operating speed is 75 characters per second.

Fast graphics plotter prints electrostatically

A new high-speed electrostatic computer graphics hard-copy printer, which is also effective for X-Y plotting, facsimile, line printing and automatic drafting, needs only 5 s to place \(10^6\) fine black dots in a 10-in. square. Each dot is accurately positioned by digital logic to form the desired patterns. It is a self-contained desk-top unit designed for direct computer interface.
Compact data sets come in card form

Tel-Tech Corp., 9170 Brookville Rd., Silver Spring, Md. Phone: (301) 589-6035.

Two compact medium-speed data modems, the TT-202 and the TT-201, are available in PC-card form, rack mounted, or desk mounted. They are ideal for integral installation in terminals operating at rates of 1800 or 2400 bits per second. The basic cards measure 12 x 6 in.; the tallest component is 1-in. high. The 202 consists of just one card, while the 201 is two cards.

CIRCLE NO. 399

Eight-input multiplexer shifts $7 \times 10^6$ times/s

Computer Labs., 1109 S. Chapman St., Greensboro, N.C. Phone: (919) 292-6427. P&A: $2400; stock to 30 days.

Designed for high-speed digitizing of analog inputs, the MUX-810 multiplexer accepts eight analog signals and feeds them to a single output at a rate of 6.6 million connections per second. The connections can be made sequentially, with any number of channels in the sequence, or on a random-access basis. Single-channel stepping is via a front-panel push button.

NEW from BULOVA

...DC Servo Amps

2.5w to 2,500w

Here's a line of servo amps packaged for flexibility and priced for system saving. It's another example of Buloval's unique capability in producing quality servo products at a price lower than you can make or buy.

Available from 2.5 w to 2.5 Kw
- Stained in flat pack, modular or rack mount - to meet industrial or mil-spec - able to operate from AC or DC - to include power supply when required.

FEATURES:
- Adjustable Gain
- Current Limiting
- Voltage or Current Feedback
- Wide Bandwidth
- Low Cost

Bulova also offers a complete line of AC servo products, including servo amplifiers, modulators and demodulators, plus a line of power supplies.

DESIGNED TO DRIVE:
- DC Torque Motors
- Low Inertia Motors
- DC Servo Motors
- Servo Valves
- Deflection Coils

Don't miss out on this Bulova Servo Special. For new applications or old ... for help in planning new servo systems ... for the lowest price on DC Servo Amps ... Look to Bulova!

DATA PROCESSING

Data multiplexer links 64 terminals

Operating with instruments or circuitry having a BCD output, the CC1200 economy code converter translates information into hard-copy printout or computer-compatible punched paper tape. All it needs is a model 33 Teletype to provide the permanent record. With zero suppression, its input capacity is a 10-digit BCD signal.

High-speed data modem transmits 3600 bits/s

Design Elements, Inc., 2074 Arlington Ave., Columbus, Ohio. Phone: (614) 486-7755.

Design-79 acoustic data couplers offer fm data transmission, LC filtering for high noise rejection, and error-free transmission. The units are fully compatible with all standard telephones and may be used with all popular data terminals. They are available in originate only, answer only, and originate/answer models.

Economy code converter allows hard-copy record

International Communications Corp., sub. of Milgo Electronic Corp., 7620 N.W. 36th Ave., Miami, Fla. Phone: (305) 691-1220, Price: $3995.

A new data set is capable of transmitting 3600 bits per second over dial-up telephone lines. Modem 3300/36 also has a 150-bit-second reverse channel. This allows maximum throughput by eliminating the line turn-around time normally encountered with high-speed dial-up operation.

Data couplers filter noise

Dynelec Systems, Inc. 139 Harristown Rd., Glen Rock, N.J. Phone: (201) 447-0900. Availability: 45 days.

DyneCoM 70W is a compact communications multiplexer that can concentrate data from 2 to 64 remote low-speed asynchronous terminals over a single 2400-bit-second voice-grade line. The unit automatically intermixes and simultaneously operates each four-speed data circuit from 45.5 to 300 bits per second.

SERVO PACKAGE PROBLEMS?

When it comes to servo packages, we've got the technical considerations licked. That goes for both components and packaging design.

We can give you the "tightest" job at the lowest price and meet your delivery requirements, too.

We have literally thousands of different servo components. Motors: stepper, synchronous, braked, viscous-damped and inertial-damped. Motor generators: rate, damping, integrating and high-signal-to-noise. Synchros and resolvers of all descriptions. Clutches, brakes and gearheads.

We design and build all the associated electronics: servo and buffer amplifiers, stepper-motor logic packages, phase-shifting capacitors, quadrature rejection circuits, electronic choppers and summing, isolation and switching networks.

All you have to do to solve similar problems is call one single source—Kearfott. Write today to: Kearfott Division, Singer-General Precision, Inc., 1150 McBride Avenue, Little Falls, New Jersey 07424.

ANSWER: KEARFOTT'S "ALL UNDER ONE ROOF" SERVICES.

Hybrid microcircuit boasts 500-W output

TRW Electronics Semiconductors Div., 14520 Aviation Blvd., Lawndale, Calif. Phone: (213) 679-4561. P&A: $8; 4 wks.

Mounted in a TO-3 case, a new power hybrid microcircuit handles 500 W of output power. The DPS-1000 is a dual-power Darlington switch that delivers currents of 5 A average and 10 A peak, from 50-V power supplies. It has a current gain of 1000 and reverse transient suppression. Total rise time is 150 ns and storage time is 1.5 µs.

CIRCLE NO. 406

Modular power supply retails at only $23.50

Providing a dual output of ±15 V at 25 mA, a new modular regulated power supply costs only $23.50. The model ZM 1525 encapsulated module regulates 0.2% for line and load and has 2 mV pk-pk of ripple and noise. It is short-circuit proof and will operate from −25 to +71°C without temperature derating. Input voltage is 105 to 125 V ac at 50 to 400 Hz.

CIRCLE NO. 407

High-voltage op amp has 10-pA input bias

Intech Inc., 1220 Coleman Ave., Santa Clara, Calif. Phone: (408) 244-0800. P&A: $85; stock.

With supply voltages up to ±50 V, the model A-160 high-voltage operational amplifier offers a maximum input bias current of 10 pA. It also features 94 dB of common-mode rejection and 20 µV/V of supply rejection. Slewing rate is 20 V/µs and open-loop gain is 200,000. Typical bandwidth is 4 MHz and drift is 25 µV/°C. The unit measures 1.5 × 1.5 × 0.4 in.

CIRCLE NO. 408
Video amplifiers slew at 180 V/µs

Two new high-gain video amplifiers provide slew rates of 100 V/µs (the MS100A). Both units offer an open-loop gain of 50 dB with a 3-dB bandwidth of 1 MHz. Each device delivers 700 mW of output power, and each has an open-loop output impedance of 33 Ω. Operating temperatures can range from −55 to +80°C.

CIRCLE NO. 409

PC-card supply delivers 230 V

Mylee Digital Sciences Inc., 16 Progress Parkway, Maryland Heights, Mo. Phone: (314) 542-4525. P&A: $34.50; stock to 2 wks.

Built on a plug-in printed circuit card, a new variable high-voltage power supply provides a minimum output current of 35 mA with the output voltage adjustable from 170 to 230 V. Model HVPS-2 has a regulation of ±1% for line variations of 10 V, and ±1% for load variations from zero to full load. Maximum input power is 225 mA at 115 V ac.

WORKHORSE!

Nothing fancy, and not expensive. Just a good old 10 stage photo-multiplier but: It has a superb bialkali cathode with excellent collection efficiency (which is fundamental for good S/N ratio), highly stable CsSb dynodes which provide a gain of 10^8 at just over 1,000 volts, and a dark current of $10^{-10}$ A. at that voltage (50 A/L).

As usual EMI has provided a number of variations: 9750QB with a spectrosil window for UV and low level counting applications, (liquid scintillation) 97508 with Pyrex window for visible applications, and finally 9750KB for those who prefer the B-14A overcapped base. In the “K” configuration, it is directly interchangeable with our 9656KB or a number of competitive types.

The 9750 with its high quantum efficiency and low dark current gives excellent resolution for low energy gamma rays. When used with a thin two inch sodium iodide crystal with a beryllium window, the resolution for Fe^{55} is of the order of 40%.

Flying spot scanners, photometers, thermoluminescent dosimeters, low level scintillation counting are all applications for which the 9750 is highly suitable. Detailed specifications on request from:

Victoreen's rare specimen!

Our MOX-1125. A rare specimen made only by Victoreen. With rare qualities in the 1-10,000 Megohm range. Rated at 1.00W @70°C. 5,000 volts maximum. Yet it's just .130" in diameter by 1.175" long.

It's one of Victoreen's Mastermox metal oxide glaze resistors. About one-half the size of competitive resistors of similar power handling capacity.

All Mastermox resistors are rare performers. Excellent stability: As little as 1% drift under full load in 2000 hours — with more than 40 watts power dissipation per cubic inch. ±0.5% tolerance. 10K ohms to 10,000 Megohms resistance range. Voltage and temperature cycling leaves no permanent effect. And Mastermox stays potent on the shelf — less than 0.1% drift per year.

Get Mastermox. Rare resistor performance.

The models DA223, DA224 and DA225 are de-coupled, all-silicon, solid-state modular packages capable of supplying up to ±2.0, ±4.0 and ±6.0 amperes of deflection current respectively to each axis of a directly-coupled deflection yoke. A unique method of damping optimizes the amplifier for the particular yoke being used by means of an adjustable potentiometer. The amplifiers also feature extremely fast settling time and high bandwidth. The user has the choice of operating the amplifiers Class A for achieving nonlinearities of ±0.02% maximum or Class AB for minimum power consumption.

**HIGH & LOW VOLTAGE CRT POWER SUPPLIES**

SERIES HV provides regulated high voltage outputs for CRT electrodes—anode, focus grid, G2, and filament.

**MODULAR CRT BUILDING BLOCK COMPONENTS**

Individual, compatible plug-in circuits such as: DF2050 Dynamic Focus Generator; DF347 Electromagnetic Dynamic Focus Amplifier; DF2496 Electrostatic Dynamic Focus Amplifier; LC2656/2676 Precision Linearity Correction Circuit; LC915/918 Linearity Correction Circuit; VA2076 Video Amplifier (10 MHz); VA2075 Gamma-Corrected Video Amplifier (10 MHz); VA2769 Video Amplifier (10 MHz, 60 volt output); VA2077 Video Amplifier (30 MHz); SG1190 X-Y Sawtooth Generator; PP529 Phosphor Protection Circuit; DA341 Deflection Amplifier (+-200 mA); DA3140 (+-75 amperes); EDA800 Electrostatic Deflection Amplifier (350 volts plate-to-plate positive or negative); EDA1504 Electrostatic Deflection Amplifier (500 volts plate-to-plate positive or negative); FR1882 Static Focus Regulator; BA114 Blank/Unblank Amplifier. All Beta circuitry features silicon semiconductors and temperature stable metal-film resistors throughout.

**PRECISION TUBE AND COIL MOUNTS**

Flexible combinations of standard assemblies for the precision mounting and alignment of CRTs, yokes and coils: CRTM Basic CRT Mount includes removable bezel, rods and neck end clamps; DSTM Dual Gun Recording Storage Tube Mount, includes rods and neck clamps both ends; MDST Micropositioner Coil Mount allows 5 independent motions and positive lock; FYM Fixed Yoke Mount for application where micropositioning is not required; FYMS Fixed Yoke Mount for servo-type mounted yokes; CCM Centering and/or Alignment Coil Mount; MS983 Magnetic Shield Enclosure.

**Monolithic regulator goes to 37 V at 150 mA**

A new monolithic voltage regulator, type ICB8723C, features an output voltage that is adjustable from 2 to 37 V, with 0.01% line and load regulation. Npn or pnp pass elements may be added when output currents exceeding 150 mA are required. There are provisions for adjustable current limiting and remote shut-down. The new regulator can operate from positive or negative supplies.

**Decoder circuit has level shift**

Accepting TTL inputs and supplying 1-to-9-V outputs to drive low-threshold MOS devices, a new one-of-eight decoder features an integral bipolar-to-MOS level shift. Model 1400 also has two chip-inhibit inputs for ease of expansion, and its output is short-circuit protected. In addition, the output stage is free of current spiking during switching to reduce ac power.

Now! One new exclusive switch replaces seven

You can easily eliminate tedious design engineering problems—just use versatile Multidex® switches. They’re available in thousands of variations... are smaller than the switches they replace... yet provide more contacts (up to 36) at no additional cost. Crisp Detenting... the patented Unidex™ detent offers uniform “feel” for long life in choices from 10° to 36° throw. Meets MIL-S-3786, SR32 requirements.

Superb Insulation... molded diallyl phthalate meets MIL-M-14 requirements and guarantees electrical continuity between mounting and housing. Glass-alkyd insulation available on request. Special contacts and clips... Oak-pioneered, double-wiping, self-cleaning contacts assure trouble-free operation. Special AF clips with large windows speed wiring.

What’s more, Multidex switches meet commercial and military environmental requirements. Special options available on request. For full details, write today for Bulletin SP-324.

Compensated op amp protects itself

Texas Instruments Inc. Components Group, P.O. Box 5012, Dallas, Tex. Phone: (214) 238-2011. P&A: $2.40 or $3.95; 2 wks.

Beside being short-circuit protected, a new linear IC operational amplifier features internal frequency compensation for high stability without the need for external components. Characterized over the temperature range of 0 to 70°C, model SN72741 is offered in both an 8 and 14-pin plastic dual-in-line package. Its power dissipation is 50 mW.

CIRCLE NO 459

Hybrid drivers supply 250 mA

Three new hybrid drivers, the NH0011, NH0011C and NH0011-CN, use an integrated-circuit driver and a high-voltage output transistor to deliver output currents from 150 to 250 mA at up to 40 V. In addition, the units provide logic flexibility by employing a four-input NAND gate, a NOR input and a logic output to give latching capability.

CIRCLE NO. 461

Video amplifier chips gain 20 dB at 100 MHz

Requiring only 100 mW of power at 12 V, series 401 high-frequency video amplifiers feature a voltage gain of 20 dB at 100 MHz, 5-ns rise and fall times, and fixed or variable gains. These monolithic circuits also offer single-supply operation and symmetrical limiting. The gain may be varied through the use of integral diodes.

CIRCLE NO. 460

Tiny light sensor generates 10 mA

Suitable for applications where the available light is below normal industry standards, a new extra-sensitive silicon planar Darlington light sensor can generate light currents in excess of 10 mA at an irradiance of 1 mW/cm². With normal light input, the OP 300 phototransistor supplies an output current that is sufficient to drive IC logic circuits.

PLUG-IN FAMILY

(20 KHz - 1 GHz)

Over 50 wee relatives have a lot in common. All are broadband devices, frequency and performance compatible for your use in RF, IF and microwave signal processing. They’ve had on-the-job experience in printed circuits. And all are ready to travel immediately or on 2 to 3 weeks notice.

90° HYBRIDS

±5% of center frequency. Greater than 20 db isolation. VSWRs less than 1.3. Phase 90° ± 2°.

180° HYBRIDS

4-port devices (rat-race equiv.) with decade bandwidths. Loss less than 1 db. Isolation greater than 30 db. VSWRs less than 1.3.

BI-DIRECTIONAL COUPLERS

Decade bandwidths. Coupling 10-30 db. Loss less than 0.5 db. VSWRs less than 1.3. Directivity greater than 25 db.

DOUBLE-BALANCED MIXERS

All use hot carrier diodes. Conversion loss and noise figures less than 6.0 db at 200 MHz and 8.0 db at 400 MHz. All ports isolated and an IF operating to DC.

POWER DIVIDERS/COMBINERS

2-way, 3-way devices with decade bandwidths. Less than 0.5 db loss. VSWRs less than 1.3.

MIC AMPLIFIERS

VHF integrated circuit amplifiers with stabilized operation. 3 db bandwidth (5 to 200 MHz). 21 db gain. +12 dbm power output. VSWRs (input-output) 1:1 (50 ohms).

N-WAY POWER DIVIDERS

4-way plug-ins with Loss less than 1 db. Isolations greater than 25 db. VSWRs less than 1.3.

SOLID-STATE SWITCHES

Fast-switching SPST, SPDT and DPDT units with excellent switching signal isolation (over 25 db). Low insertion losses and high on/off ratios.

our new PLUG-IN FAMILY ALBUM (circa 20 KHz - 1 GHz) includes guaranteed specifications on these and other devices. Write, wire or phone ANZAC, 39 Green Street, Waltham, Massachusetts 02154 • (617) 899-1900.
Schrack's NEW MINIATURE STEPPING SWITCH, Type RTM, is the smallest stepping switch available on the market today. Only \( \frac{1}{4} \) the size of comparable steppers, it combines high performance with economy of space and cost.

The RTM is equipped with 2 x 10 or 2 x 12 gold-plated contacts and mates with our socket which meets standard printed circuit spacings. Unique hold-down spring enables mounting in any position.

Write for free catalog today. Schrack also manufactures all types of relays, stepping switches and accessories. Catalogs upon request.

Mid-Eastern's ABC Series power supply system allows you to select the power supplies, panels, and racks which meet the requirements of your system exactly. Now you may buy only the power and options you need. You can select from models with outputs from 3 to 200 volts. You can choose from four panel styles in quarter or half-rack sizes: (1) blank; (2) on/off control with pilot light; (3) metered: volts and amps; or (4) complete with volt and amp meters, on/off control, pilot light, output terminals, and voltage adjust. You can pick a four-module or eight-module rack.

In short, you may create your own custom power supply system at a far lower cost than comparable non-modular units.

Each M-E power supply is series pass regulated with the most advanced integrated circuit control amplifiers and reference voltage circuits. Remote sensing, parallel or series operation, complete repairability, and solid-state overload protection are standard features. Overvoltage crowbar protection is available among the options.

Input: 105-130 VAC, 50-60 Hz
Output: 3V/10A to 200V/1.0A
Regulation: Line: 0.02%
Ripple: < 500 µV rms
Load Response: < 50 µ seconds
Operating Temp.: 0-50 °C, 71 °C derated

Send for tech specs covering all ABC Series models, panels and racks. Or call your nearest M-E representative for fast, personal service.

Contest

Last year, Fairchild gave a series of seminars on Linear Integrated Circuits in which we introduced 12 new products. One device, the µA742 TRIGAC Zero-Crossing A.C. Trigger, was so significant we offered a free sample to anyone who came up with an original application for it. We got hundreds of replies. The most ingenious was sent in by Richard M. Burkhart, a graduate student at the University of Illinois. We liked Richard's application so much, we decided to give him $100. Then, we liked the $100 idea so much, we decided to make it a contest.

For a long time, Fairchild built only linears designed by Fairchild engineers. We didn't think anything else was worth the effort. People said we had an NIH (Not Invented Here) complex. And, they were right.

However, it's been brought forcefully to our attention that a couple other guys in this business know what they're doing. The competition is coming out with some pretty worthwhile linears. Our customers have noticed too, because they're talking to other manufacturers about linears we don't make. They're even talking to sole sourcers!

To keep things even, we've decided to give our wandering customers something they're going to need if they start dealing with a sole source linear maker: A second source. Us. (Just in case the original supplier's factory blows up or they lose the formula or whatever it is that happens when you can't get delivery.)

Here's how it works:
1) Get all the facts on a Fairchild Linear IC.
2) Design the world's greatest application for it.
3) Send the application to us. All entries will be judged by the editors of EEE Magazine. Every month, they will select the most fantastic application and give us the designer's name. We'll publish the winning design here and give the winner $100 upon publication.

To give you an idea of what we're looking for, here's Richard Burkhart's design:

Send all entries to: Fairchild Linear Contest

ECC CAN SOLVE YOUR OVERSIZE 50 VOLT RADIAL LEAD CAPACITOR PROBLEMS. If you’ve been looking to buy truly miniature 50-Volt metalized polyester radial lead capacitors, look to ECC. ECC utilizes 17 specific package sizes to package their 50 volt capacitor products, encompassing more than 90 standard values from .001 to 5.0 mfd. Space saving package sizes range from .100W x .285L x .225H to .475W x 1.100L x .650H. Designed for PC board installation, these radial lead capacitors are epoxy encapsulated in Diallyl Phthalate housings; packages incorporate stand-off feet to allow solder fillet formation, inspection and flush cleaning. Lead length is .125(min.) with break-outs on .100 increments. ECC Radial Lead Capacitors meet applicable requirements of MIL-C-18312, MIL-C-27287 and MIL-C-19978. Standard values are available from stock or within 3 weeks ARO. Circle the reader service number for a copy of Catalog C-4/69.

High-accuracy DPMs resolve $10^4$ counts

Computer Products, 2709 N. Dixie Highway, P.O. Box 28349, Fort Lauderdale, Fla. Phone: (305) 565-9565. P&A: from $273; 15 to 30 days.

With a resolution of 10,000 counts, series DP400 digital panel meters yield accuracies of ±0.02%, ±1 count. Full-scale input ranges for voltage meters are 1, 10 or 100 V. The units have a self-contained power supply, and operate with a temperature coefficient of 0.003%/°F. Their dimensions are 4.2 × 2.5 × 3 in.

If your equipment calls for custom-designed protection...

Give us your out-of-the-ordinary container requirement—and we'll meet it. Precisely. In the shortest possible time. Because we have everything it takes to do the job. Sandwich construction materials. Off-the-shelf components. Standard hardware. Over 30 years of experience in the manufacture of cases and containers. The result? Complete equipment protection against shock, vibration, and environmental hazards. Built to all required MIL specifications. We also make custom molded and standard fiberglass and ABS thermoplastic containers and cases. Call or write for our standard price lists and comprehensive design manuals.

Skydyne will "contain" it for you.

INFORMATION RETRIEVAL NUMBER 212

ELECTRONIC DESIGN 6, March 15, 1970
New Op Amp has Gain of 3,000,000.

Fairchild's new µA725 Instrumentation Operational Amplifier can do the same jobs that used to require expensive chopper-stabilized or complex discrete component amplifiers. The µA725 is ideally suited for use in Low Level Signal Conditioners, Instrumentation Amplifiers, Precision Measuring Equipment, Process Control Systems and Data Acquisition Equipment.

Electrical Performance/Features
- Low Input Noise Current . . . . . 0.6pA/Hz
- High Open Loop Gain . . . . . . . . . 3,000,000
- Low Input Offset Current . . . . . . . . 3nA
- Low Input Offset Voltage Drift . . . . . . . . . . . . . . . . 0.5µV/°C
- High Common Mode Rejection . . 120dB

One of the many applications for the µA725 is in Linear photodetection systems. Use of a PIN Photodiode with the µA725 provides the user with a low noise linear detection system which operates from low voltage supplies and has none of the inherent disadvantages of photo-multiplier tubes (high voltage supplies, aging effects, large physical size, high power dissipation).

Reader Service Number 110

µA715 Basis of Fast Sample/Hold Circuit.

Many data acquisition systems require a sample and hold circuit to improve analog-to-digital conversion accuracy. The requirements of a good S/H circuit are:
1. minimum droop during the hold period
2. high open loop gain for good closed loop gain accuracy
3. high speed
4. minimum temperature drift
A basic sample and hold circuit configuration looks like this:

In the sample mode, the sampling switch Q1 is turned on and the circuit functions as an inverting operational amplifier.

When Q1 is switched off, the circuit functions as an integrator, holding the output voltage constant at the sampled value.

The acquisition time when going from the hold mode to the sample mode is a function of the time constant RxC1 and the required accuracy, and is given by:

\[ t_a = \frac{100}{R \cdot C_1 \cdot \ln \left( \frac{\text{accuracy}}{100} \right)} \]

A A715 SAMPLE AND HOLD CIRCUIT

Holding Accuracy. During the hold time the output voltage will tend to drift as the holding capacitor integrates the input bias current of the amplifier. This drift is compensated by supplying temperature compensated bias current from a separate source, R5, R6, R7, and D1.

With a 10 volt step input (±5 volts to ±5 volts) the settling time to ±0.05% is 10µsec. This is slightly longer than that given by equation 1 due to the finite "on-resistance" of the sampling switch Q1. If C1 is decreased to 100pF the settling time is about 1µsec. Temperature drift of the output in the hold mode is approximately 0.001% per degree Centigrade for a hold time of 100µsec.

Antiques are fine—
but not for test instrumentation.

Move up to our Automatic Synchro/Resolver Bridge.

Use your test engineers as they should be used...as skilled observers...not dial twisters. Complex set ups that require operation of a manual synchro bridge and an error detector are time consuming and frequently error producing.

Our unit features:
- Completely automatic nulling
- Accuracy and resolution of .1°, .01° or .001°
- In-line decimal readout
- BCD electrical output
- Accommodates 11.8, 26, and 90 VAC inputs
- High input impedance
- Insensitive to quadrature and distortion.

For further information, or a demonstration at your plant, phone or write: astrosystems, inc. 6 Nevada Drive, Lake Success, New York 11040 516 / 328-1600

Conductive carriers protect MOS chips

Aluminum-plated conductive carriers eliminate the static electrical charges that can build-up and ruin MOS IC devices during handling and shipping. Because the carriers are coated with vacuum-deposited aluminum, there is a conductive plating over their entire surface. This coating keeps all leads shorted so that no voltage differential can exist between them.

CIRCLE NO. 437

Cable jacketing goes on with twist

Zippertubing Co., 13000 S. Broadway, Los Angeles, Calif. Phone: (213) 321-3901.

Called Zip-tight, a new cable jacketing comes in pre-zipped spiraled lengths so that its inside diameter is much larger than the wiring or items to be jacketed. Cable is simply inserted in the wide-mouth opening of the jacketing, which is then twisted with a slight wrist action to form a tight and compact finished unit. Length and material type can be specified.

CIRCLE NO. 438
Interface connectors accept 2 cable types

Microdot Inc., Connector Div., 220 Pasadena Ave., S. Pasadena, Calif. Phone: (213) 682-3351.

Designed specifically for use with flat cable, a new connector series will accept round cable, or a combination of flat-conductor and round cables, thus acting as an interface between equipment with different cable types. The connectors' unique design permits users to completely terminate the cable and check circuits before the completed assembly is inserted into the metal housing.

CIRCLE NO. 439

Ribbon cable stays flexible

Flexible flat-conductor cable is now available for use in military, commercial, industrial and computer applications. A choice of five insulations is offered: polyester; self-extinguishing polyester; total polyimide, for use to 250°C; polyester bonded polyimide, for operation to 150°C; and polyimide Teflon fluorinated ethylene propylene-bonded, for operation to 200°C.

CIRCLE NO. 440

NOW! from RMC

"ACROSS-THE-LINE"
U.L. LISTED DISCAPS

RMC now offers a complete line of ceramic disc capacitors fully approved by Underwriters Laboratories for the NEW "Across-The-Line" capacitor requirements. This approval is required of all capacitors utilized directly or indirectly across the power supply line.

This application is significantly different from the "Antenna Coupling and Line By pass" capacitor requirements of Underwriters Laboratories Subject 492, and the original RMC -U- capacitor type continues to be approved for those applications.

SPECIFICATIONS

CAPACITANCE: Within specified tolerance:

Class I @ 1Kc and 25°C
Class II @ 1Kc and 25°C

CAPACITANCE TOLERANCES AVAILABLE:

Class I ±5% or ±10% or ±20%
Class II ±20% or ±80 – 20%

WORKING VOLTAGE: 150 VRMS @ 60 cycles (210 volts peak AC plus DC)

POWER FACTOR:

Class I .1% max. at 1 MC
Class II 1.5% max. at 1 KC

INSULATION RESISTANCE: Greater than 7500 Megohms @ 500 VDC

TEMPERATURE COEFFICIENT:

Class I NPO N750 N1500
Class II Z5U; Z5F 1500 pfd. And Less.

FLASH TEST:

Per U.L. Sub. 492

LIFE TEST:

Per U.L. Sub. 492

INSULATION RESISTANCE AFTER HUMIDITY:

Greater than 1000 Megohms @ 500 VDC

BODY INSULATION: Durez phenolic-vacuum wax impregnated. Standard coating on leads 3/16 max. measured from tangent

LEAD STYLES AVAILABLE: Long lead—#20 AWG tinned copper

PACKAGING & MATERIALS

Termination system grounds and shields

Chomerics, Inc., 77 Dragon Court, Woburn, Mass. Phone: (617) 935-4850.

Using a conductive grounding grommet, a new terminating system provides both rfi shielding and shield grounding right at connector terminations. Individual shielded wires are forced through the preformed holes in the grounding grommet, leaving a short length of exposed shield inside the grommet. A ground is achieved by bussing the conductive grommet to the connector backshell with a heat-shrinkable conductive boot.

CIRCLE NO. 441

Cermet pastes hold 50 ppm

Cermalloy, Cermet Div. of Bala Electronics, Corp., P.O. Box 485, Bala Cynwyd, Pa. Phone: (215) 828-4680. Availability: stock.

Developed for thick-film microcircuits, a family of thixotropic cermet pastes have a temperature coefficient of 50 ppm for resistance levels from 100 ohms per square to 10 kilohms per square. These new inks are completely blendable over the entire sheet resistivity range, and can be trimmed by a laser. They are batch-to-batch reproducible.

CIRCLE NO. 442

ELECTRONIC DESIGN 6, March 15, 1970
Conductive paint boosts shielding

Eccoshield ES is an electrically conductive lacquer based on fine silver with good coatability and adherence to almost any clean hard surface. It was developed especially to enhance radio-frequency shielding integrity. One coat of the material gives a surface resistivity of less than one ohm per square; successive coats reduce this to 0.1 ohm per square.

Diamond compounds come as aerosols

Primarily intended for use aboard aircraft, a high-temperature lightweight low-loss flexible coaxial cable can operate at temperatures as high as 400°F. The MI-5224 cable consists of a stranded silver-covered copper inner conductor insulated by a taped TFE dielectric. The outer conductor is a double braid of flat silver-covered strips of copper.

Braided coax cable withstands 400°F

Premier Metal Products Co., div. of Sunshine Mining Co., 337 Manida St., Bronx, N.Y.

A new line of adjustable printed-circuit-card files can accommodate card widths from 2-7/8 to 8 in. and depths to 14-1/2 in. Series PHC units fit standard 19 and 24-in.-wide racks for 5-1/4, 7 and 8-3/4-in. panel heights. The 19-in. frames hold up to 27 cards; the 24-inch frames accept as many as 36 cards. They also have two adjustable rear connector panels.

PC-card files adjust size

Available in 5 and 14-ounce aerosol dispensers, a new line of diamond compounds are designed for applications where uniform application is absolutely necessary. The new spray compounds and lubricants are all color-coded for easy and fast identification. Alignment of the spray nozzle for proper and complete emptying of the can is greatly simplified by a directional arrow.

Test Power Transistors

The Lorlin Automatic Transistor Tester Model TB is programmable over a range of 0.1 nanocamps to 10 amp and 10 mV to 600 V. All types of transistors from small signal to high power can be tested for breakdown voltages, leakage, gain and saturation voltages with 1% accuracy.

A complete test sequence can be programmed by the operator in minutes. Since a standard test takes just 16 milliseconds, high daily throughput is possible.

Models are available with up to 24 test positions and 18 sorting classifications. Remote test stations with the same range and accuracy are available to permit several operators to share one tester. All Lorlin testers will interface with automatic probing, handling and classifying equipment.

Lorlin testers are designed for maximum reliability, ease of service, convenience of programming, and simplicity of operation. Their speed, accuracy and reasonable price provide users a substantial return on their capital investment. Write or call for more information and a demonstration in your plant.

TOOLS & ENGINEERING AIDS

Plastic syringe applies resins

Permitting controlled application of resins without contamination, a new polyethylene syringe provides easy access to otherwise inaccessible areas. The unit has a tapered tip that can be cut back to accommodate high-viscosity resins, and a tapered cap that can be cut to accept steel adaptor needles. Sizes range from 6 to 50 cm³. The barrels are self-venting.

CIRCLE NO. 447

DIP IC inserter is spring-loaded

A new spring-loaded hand tool is designed for inserting dual-in-line packages into printed circuit boards. Most DIP hole patterns are slightly narrower than the actual lead spread. This holds the circuits firmly in place during handling or wave soldering. The type 52 inserter automatically squeezes the package to fit the hole pattern, and then ejects it when the DIP is firmly placed in the circuit board.

CIRCLE NO. 448

ELECTRONIC DESIGN 6, March 15, 1970
Regulating heat gun adjusts to 900°F

Sigma Systems Corp., 3163 Adams Ave., San Diego, Calif. Phone: (714) 283-3193.

Having precision-resetting capability, a new heat gun yields adjustable temperatures from ambient to 900°F. Excellent regulation is achieved with the model ER900 by phase-angle control of the heater current from 0 to 14 A with a constant-velocity air flow. Product damage from overheating is virtually eliminated since the temperature can be preset and limited by the operator.

CIRCLE NO. 449

Component trimmer cuts parallel leads

Technical Devices Co., 11242 Playa Court, Culver City, Calif. Phone: (213) 870-3751. P&A: $275; stock.

Designated the Mark IX, a pneumatic machine trims parallel leads of components such as transistors, disc capacitors, DIP modules, TO cases, and many other packages, within one-square-inch area. Quick-change dies allow the trimming of up to 20 leads on a single module to specified lengths from 0.05 to 0.5 in. A foot control valve is included.

Materials dispenser ejects tiny amounts

Fluidyne Instrumentation, 3685 Mt. Diablo Blvd., Lafayette, Calif.

The Picoshot is a unique device that can dispense tiny quantities of highly-viscous materials. It dispenses epoxy, urethane and silicone resins for component coating, sealing and bonding. The device is a precision-machined pump that is driven by an air cylinder, and a rack-and-pinion with a one-way over-travel clutch. Individual shot-size adjustments are accomplished by a micrometer.

CIRCLE NO. 453

Drafting pen set shows ink supply

Alvin & Co., Inc., 611 Palisado Ave., Windsor, Conn.

The P396C Draftech drawing pen set comes complete in a custom-form plastic case with seven interchangeable nib points. The pen itself features a visible ink supply, an extra-large ink capacity and a precision stylus guide for controlled line widths. This new pen set is suitable for all types of technical drawings and lettering applications. Other sets are available with 10 interchangeable nib points.

Evaluation Samples

Breadboard system

A new concept in circuit packaging permits rapid assembly of all prototypes and limited-quantity production systems directly from engineering schematics and logic flow diagrams. The Circuit-Stik packaging system is a complete family of circuit subelements and circuit materials that allows individual circuit boards to be assembled and tested from engineering sketches the same day.

Conductive circuit subelements are supplied on thin substrates with a pressure-sensitive adhesive backing. They can withstand soldering temperatures and can be easily modified with an ordinary pair of scissors. The elements offer good adhesion strength, and yet can be removed when design changes are necessary.

There is a wide variety of patterns available for all commonly used components, including flat packs, dual-in-lines, and TO-5-packaged integrated circuits, transistors, diodes, resistors, test-point jacks, and plug-in printed-circuit-board connectors.

Also eliminating the need for drilling, series 1000 circuit subelements have preplated copper patterns that are used with 0.1-in. punched board material. When these pressure-sensitive circuit elements are placed on the backing board, the result is a reliable printed circuit board ready for mounting and conventional component soldering.

Prototypes can now be as neat and professional-looking as the final off-the-production-line designs. Gone are the stand-off-mounted components and wobbly terminals. Delays normally encountered for artwork, etching and drilling are also circumvented in just a few minutes.

All types of circuit elements can be mixed and combined on the same board. In addition, special configurations are available for use with wire-wrap systems to reduce the number of sockets and wire-wraps required. Finished circuit boards can easily be expanded — by using conventional card cages and rack-and-panel hardware.

Prices for the series 1000 off-the-shelf system range from 20¢ to $2 per subelement. Another group of subelements, series 2000, are for high-density layouts.

Free evaluation samples are available to the readers of ELECTRONIC DESIGN. The manufacturer is Circuit-Stik, Inc., 1518 W. 132nd St., Gardena, Calif.

Miniature labels

Developed for precise marking of miniaturized electronic components, tiny pressure-sensitive markers, called Micro Labels, can be die cut in any required shape and size down to 0.025-in. diameters. These miniature labels can also be color coded, imprinted with characters as small as 0.007 in. in height, and consecutively numbered. They adhere readily to ceramics, metal, glass and painted surfaces. Now available as free evaluation samples, the labels are fungus-static, moisture and salt-spray resistant, and meet MIL-specification requirements. Allen Hollander/Kimball Systems.

Teeny-weeny seal

Thought to be the world's smallest, a new microminiature spring-loaded Teflon seal is now available for applications requiring very low friction, compact size, long life, chemical inertness, and indefinite shelf life. The seal consists of an elliptical garter spring with canted coils that can deflect over 50% from original size upon loading. This spring provides the required load for positive sealing. Operating temperatures can range from -65 to +550°F at most pressures. The seals, which are available as free evaluation samples, come with inside diameters from 3/32 to 5/8 in. Design Aids

Communications rule

An easy-to-use circular slide rule calculator answers several commonly asked questions about two-way radio communications systems: how far can a given system be expected to communicate; and what affect gain antennas, tower height, transmitter power, or receiver sensitivity have on performance and system cost. The calculator estimates ballpark system costs and ranges in a matter of minutes. Other factors taken into consideration by the new slide rule are receiver sensitivity, frequency of operation, vehicle noise levels, type of coaxial cable and environmental factors. Antenna Specialists Co.

Design sheets

Tri-acetate sheets, pre-printed with custom repetitive symbols, title block, diagrams or any other drawings, can save design time as well as money in many engineering departments. The sheets adhere to drawings in only seconds, and their matte surface almost thrives on erasures. Reproductions are crisp and clean, even when microfilming; there are no ghosts no matter what tracing medium is used. These laminated sheets will not curl and are transparent for easy positioning before application. Stanpat Products Inc.

Feedback design

A Nichols-chart oscilloscope CRT overlay can help design engineers to predict the closed-loop behavior of their feedback network designs. The overlay is included in a 17-page application note, "Using the 675A/676A Network Analyzer as an Education Tool." Describing the frequency behavior of electrical networks, the brochure illustrates how frequency-swept transfer and driving-point measurements can be displayed on a conventional oscilloscope. Hewlett-Packard Co.

Transmission rule

Extremely useful in solving line wave problems, a transmission line slide rule allows the conversion of a complex impedance to its reflection coefficient. Available in a heavy-plastic case, the slide rule gives an expanding area as VSWR is reduced. For example, for a VSWR of 1.2:1, the new design aid is equivalent to a Smith Chart over 20 inches in diameter, yet this device fits in a shirt pocket. Load impedance is represented at the right end of the rule, with the generator to the left, an appropriate number of wavelengths away. Cost is $8. Greencastle Electronics.
PASS ME THE AVO!
SIL VOUS PLAÎT • POR FAVOR

Worldwide, "Pass the AVO" means someone wants the most accurate, most reliable multimeter... anywhere. Twenty four ranges for AC and DC current, voltage and resistance. Full meter protection includes fuse, velocity actuated mechanical cutout and diode protection for meter movement.

This internationally famous AVO Model 8 has for over 50 years set the highest standard in multimeters. Over a million in use today!

Calibration, parts and service by factory trained personnel are available at our Plainview, N.Y. facility and in most countries throughout the world.

GENCOM DIVISION

INFORMATION RETRIEVAL NUMBER 240

GOING TO IC'S?
OR HIGHER IF'S?

Go with Clevite's off-the-shelf coupled-mode quartz filters.

The new LEM Shaft Encoders utilize a unique disc, brush assembly and electronic configuration that makes it possible to encode any function in any code with the same basic disc and rotating brush arrangement. High reliability, low torque and inertia, self-contained logic, low noise and long trouble-free life are a few of the features offered by the new LEM units.

These new shaft encoders are available in all standard and any special codes and functions at low cost. Also available is a complete line of solid state, digital displays compatible with the new encoder line. Request new catalog.

INSTRUMENT CORPORATION

INFORMATION RETRIEVAL NUMBER 241

Now you can get immediate delivery on Clevite Uni-Wafer® coupled-mode Quartz Filters. Eleven models are available right off-the-shelf—two, four, and six pole; center frequencies of 10.7, 20.5, and 30 MHz; AM or FM bandwidths of 9, 14, and 30 kHz. And they're available in cold-weld-sealed flatpacks or solder-sealed HC 18 cans.

Clevite's exclusive Uni-Wafer design uses trapped energy techniques to maximize resonant energy over arrays of resonators on a single quartz wafer. As a result, you get higher performance in a smaller package.

Clevite Uni-Wafer Filters are ideal for matching IC or conventional circuitry in VHF or UHF communications receivers, and radar, telemetry or aerospace systems. They're smaller and more reliable than discrete filters, have steeper skirt ratios, lower insertion losses, and better spurious mode rejection.

If you're going to IC's or higher IF's, Clevite Uni-Wafer coupled-mode Quartz Filters are the best way to go. For more information, including complete specifications, write Piezoelectric Division, Gould Inc., 232 Forbes Road, Bedford, Ohio 44146, or: Brush Clevite Company, Limited, Southampton, England.

Signal conditioning

Besides proper grounding techniques, a two-color 16-page booklet explains the basic types of signal sources and conventional amplifier input configurations. Illustrations and text deal with amplifier selection and the proper signal cabling methods to subdue electrical noise or ambient conditions. Procedures are outlined for identifying each signal source and detailed figures show proper signal connections to each amplifier type. The problems of signal cable shielding and troublesome ground loops are discussed, along with specific instructions for eliminating these difficulties.

Brush Instruments Div., Gould Inc.

SCR systems terms

A glossary of terms for SCR adjustable-speed/torque drive systems is featured in the latest issue of "Motorgram" (Vol. 49, No. 6). This special dictionary includes definitions for avalanche diode, closed-loop feedback, full and half-wave rectification, zener diode, and many other terms. Also in the issue are case histories on two gear-motor applications: one for a single-channel recorder and the other for a barium-solution mixer.

Bodine Electric Co.

Computer glossary

The term byte and more than a hundred other esoteric words coined by the computer industry are defined in a new eight-page brochure. This glossary of commonly used computer terms covers the word gamut from access time to zero suppression. Definitions provide cross references, synonyms and/or antonyms, and table illustrations where necessary. In defining abbreviations, root words are given in addition to the explanation.

General Automation, Inc.

Computer power

Dealing with data acquisition computer power, an eight-page technical paper discusses the relative advantages of 12, 16, and 18-bit word lengths when used for real-time data acquisition with small computers. The paper tells how speeds, memory-addressing, memory-reference instructions, micro-instructions, and memory sizes are related to the ease of use and practicability of the three different computer word lengths.

Vidar Corp.

D/a converters

Entitled "A Dissertation on Specifying, Measuring and Using Very High-Speed Digital-to-Analog Converters," a four-page technical paper gives insight into some of the problems confronting users of today's state-of-the-art d/a converter modules. The paper discusses some of the difficult-to-measure speed characteristics, suggests circuits for measuring dynamic performance, and alerts the user to problems that can arise in high-speed d/a converter applications. Settling time and glitch (output transients) are two of the topics illustrated with schematics.

Until our new Unipulser II came along.

single decade counters were pretty much alike.

Compare it with any competitor on these points: 1. Size. More compact than any comparable unit. 2. Modular. Complete with its own drive input, transfer and reset circuits. And 8-line output for control or electrical readout. This lets you combine them in series for a wide job range. 3. Price. Begins at $16 and goes down just as fast as anyone else's on quantity buys. Push button preset model begins at $19. You won't find another decade that does so much for so little. 4. Durability. Mechanical and electrical transfer life—100 million counts. Each. 5. Hundreds of uses. From metering to data processing, to all types of production control. Write for Unipulser II catalog. 622 N. Cass St., Milwaukee, Wis. 53202.

Interelectronics all-silicon thyatron-like gating elements and cubic-grain toroidal magnetic components convert DC to any desired number of AC or DC outputs from 1 to 10,000 watts. Ultra-reliable in operation (over 260,000 logged hours), no moving parts, unharmed by shorting output or reversing input polarity. High conversion efficiency (to 92%, including voltage regulation by Interelectronics patented reflex high-efficiency magnetic amplifier circuitry.)

Light weight (to 6 watts/oz.), compact (to 8 watts/cu. in.), low ripple (to 0.01 mv. p-p), excellent voltage regulation (to 0.1%), precise frequency control (to 0.2% with Interelectronics extreme environment magnetostrictive standards or to 0.0001% with fork or piezoelectric standards.)

Complies with MIL specs. for shock (100G 11 mls.), acceleration (100G 15 min.), vibration (100G 5 to 5,000 cps.), temperature (to 150 degrees C), RF noise (1-26600).

AC single and polyphase units supply sine waveform output (to 2% harmonics), will deliver up to ten times rated line current into a short circuit or actuate MIL type magnetic circuit breakers or fuses, will start gyro and motors with starting current surges up to ten times normal operating line current.

Now in use in major missiles, powering telemeter transmitters, radar beacons, electronic equipment. Single and polyphase units now power airborne and marine missile gyros, synchros, servos, magnetic amplifiers.

Interelectronics—first and most experienced in the solid-state power supply field produces its own all-silicon solid-state gating elements, all high flux density magnetic components, high temperature ultra-reliable film capacitors and components, has complete facilities and know how—has designed and delivered more working KVA than any other firm!

New Literature

Buyer's guide

Over 500 manufacturers of electronic components plus their industrial distributors and/or sales representatives are conveniently listed in a new buyer's guide. All component distribution outlets are listed geographically with telephone numbers. Covered are such components as semiconductors, capacitors, resistors, connectors and transformers. Also included are tubes, wire, relays, switches and heat sinks. The guide enables buyers to locate a standard component for immediate delivery and assists engineers in locating and obtaining technical information from qualified representatives. Electronic Distributors Tek Publishing Co., Inc.

Microwave by computer

Filtan, an easy-to-use computer program that eliminates the need for building prototype microwave circuits, is described in a brochure. It allows engineers to pre-test design performance on a computer. The program features microwave engineering language and requires less than two hours of training time to use. It is designed for full interactive use and can analyze nearly all microwave circuits. With it, the user can change circuits at will and run repeated analyses. It is available for most time-sharing and batch processing computers. Sanders Associates, Inc.

Semiconductors

A broad range of semiconductor components is described in a shortform 1970 product catalog. It gives component mechanical and electrical characteristics, maximum ratings and other specifications. Listed are voltage-variable capacitors, low-voltage avalanche zeners, temperature-compensated zener reference diodes, and logarithmic diodes. A section of the new catalog is devoted to miniature devices in chip, pellet, micro-strip and axial-lead packages. CODI Semiconductor div. of Computer Diode Corp.

Connectors

A complete series of subminiature connectors is described in a new 28-page illustrated catalog. The connectors are compact, high contact-density units built to meet or exceed the requirements of military specification MIL-C-8384B. Described and illustrated are connector configurations and insert types with 9, 15, 25, 37 and 50 contacts in both crimp snap-in and solder-pot type terminations. Also listed are combination layouts with provisions for the inclusion of high-voltage and coaxial contacts. Cinch Manufacturing Co.

Templates galore

Pictures and descriptions for nearly 200 standard templates are contained in a 24-page catalog. Included are templates for draftsmen, engineers, architects, designers, programmers and industrial layouts. Templates are grouped according to type, such as lettering and shape. Also included are 30 new metric templates, as well as a section showing customers how to order custom-designed units. RapiDesign, Inc.

MOSFETs in color TV

Two new brochures evaluate dual-gate MOSFET applications in color television receivers. One eight-page brochure shows how FETS are as effective as vacuum tubes in eliminating cross modulation in tuners. It provides schematics and performance details of the rf amplifier, mixer and local oscillator sections of a MOSFET tuner, and a 45-MHz i-f amplifier. The second brochure contains a 16-page discussion on considerations involved in designing a dual-gate MOSFET i-f amplifier. Texas Instruments Inc.

Power semiconductors

Information on a comprehensive range of power semiconductors is contained in a new rectifier diodes, thyristors and triacs catalog. The 12-page multi-colored publication features data on general-purpose, controlled-avalanche and fast-recovery silicon rectifiers. It also has data on high-voltage rectifier stacks, rectifier diodes, triacs, and thyristors. Easy-to-read charts for each item show the performance and temperature curves. Mullard Inc.
Motorola crystal controlled clock oscillators

As small as 1.5 cubic inch
Ages less than 1 x 10^{-6} per year

Where rugged construction, small size and instant warm-up are desired, Motorola Clock Oscillators fill the bill for a wide variety of applications.

Wide Frequency Range. 400 KHz to 40 MHz. Extended ranges on special order.

Small Size. As small as 1.5 cubic inch.

Stability. Ranges from ± 5 ppm to 100 ppm from 0 °C to + 55 °C. Extended ranges on special order.

Low Power. For voltage of 5v to 15v, 30 mw to 100 mw typical.

Variations in input voltage, frequency, output level and wave shape can be made to special order. Tell us your needs!

For complete information, send for a free copy of Bulletin TIC-3609 today. Write Component Products, Dept. 39-F, Motorola Communications & Electronics, Inc., 4501 W. Augusta Blvd., Chicago, Illinois 60651; or call (312) 772-6500.

THE WORLD’S MOST ACCURATE FREQUENCY SWITCH
FASTER DATA TRANSMISSION

New, GO-NO-GO Audio Switches which fire whenever the input frequency goes above, below, or is within certain definite frequency limits are now available. Accuracies as close as 1 cycle per thousand can be maintained.

Maximum response time is the length of two input cycles. All units are completely solid state.

The input frequency can be in the form of a sine or square wave. Or even in pulses in which case it measures the length of time between pulses. Frequencies from 1 hz to 40,000 hz can be handled. Higher frequencies can be handled if dividers and/or mixers are incorporated.

Highpass, lowpass, and bandpass functions are all available.

we’ve got the edge on our logic competition

And it starts with the 70 connection edge of all our logic assemblies. Our design brings more digital functions to the outside world, puts more functions on a card. And the trend toward more complex functions and large scale integration won’t obsolete our design — in fact, we’re helping make it possible.

Get an edge on your competition, choose from the industry’s widest range of logic assemblies — DTL for moderate speeds, TTL for high frequencies, and MSI for low cost through better packaging.

In the Cambion line, you’ll find all the logic cards you’d expect to need plus those one-of-a-kind required to complete your system without having to develop the card yourself. You’ll also find all the necessary accessories, connectors, card drawers and files and power supplies. In fact, you can start your system design at any level and gain a competitive edge with Cambion logic assemblies and accessories. We’ve got a manual full of them we’ll be glad to send you. Just send us your name. Do it today. Cambridge Thermionic Corporation, 445 Concord Avenue, Cambridge, Mass. 02138.

Electronic Design 6, March 15, 1970
Ultraminiature supplies

Ultraminiature dc power supplies are described in a new 16-page combination catalog/handbook. It specifies and features a complete line of PC-board-mounting dc power supplies for digital ICs. Supplies for hybrid, linear, LSI and MOS ICs are also shown. A selection guide categorizes supplies according to output (volts and milliamperes). Also included are regulation data, price information and a power supply handbook. A glossary of terms, principles of operation, operating features and detailed specifications are in the handbook.

Date! Corp.

CIRCLE NO. 631

Logic-card design

Two new descriptive technical papers discuss techniques for interconnecting and using Gold Chip high-speed logic cards. Designated Gold Chip Design Notes, they offer engineers helpful hints that can save time, money and effort. Ground screens, length of runs, routing, dynamic loading, and the use of 75-Ω coax cable are topics discussed in the initial monograph.

Data Technology Corp.

CIRCLE NO. 633

Potentiometer design

The increased flexibility offered to the designer by the use of special potentiometer packages is illustrated in a new potentiometer-design brochure. Applications and special packaging options are cataloged for the designer to use as a reference when considering the use of a precision potentiometer or trimmer. Examples of cost-saving designs and support capabilities highlight an engineering focus on the design and production of special products.

Spectrol Electronics Corp.

CIRCLE NO. 636

IC sockets

More than 290 test sockets for TO-cased IC and microcircuit packages are listed in a new 20-page catalog. Detailed are 25 different socket styles for packages with 6 to 14 leads. They are designed to meet any test, burn-in and production requirement. A socket-selection table in the front of the book guides the user to the correct socket style.

Barnes Corp.

CIRCLE NO. 635

Emi/rfi shielding

Five fast and effective ways to prevent emi/rfi problems are described in a new eight-page brochure. It features the specifications and descriptions of eleven different shielding products. These materials are available in strip-extrusion, rf strip, wire-mesh, weatherstrip and gasket forms. Specifications include dimensions, part numbers and material composition.

Metex Corp.

CIRCLE NO. 634

Wirewound resistors

Five types of low-cost wirewound power resistors are described in a new folder. Produced by a continuous-winding method, the resistors use high-quality resistance wire that is wound over a woven fiberglass core. They are available in bare or molded styles encased in a ceramic package. Standard and special tolerances included are ±10 and ±5%, respectively, and operating temperature ranges from -55 to +275°C.

Dale Electronics, Inc.

CIRCLE NO. 637
Wire and cable materials

A concise new nine-page catalog lists a full line of wire, cable, tubing, sleeving and microwave-dielectric products. Each of these product categories is shown with application data, technical data such as temperature and voltage ratings, dimensional information, and descriptions. The last page discusses dielectric materials used for low-dielectric applications. American Enka Corp., Brand-Rex Div.

CIRCLE NO. 638

Relays

Catalog 170 lists hundreds of different relays with their descriptions, specifications, dimensions and prices. It lists telephone, aircraft, mercury-wetted, differential and polar types. Also included are sensitive, latching, timing, sealed, resonant and stepping models. One part illustrates a line of relay sockets and another contains a table of contents. Universal Relay Corp.

CIRCLE NO. 639

Research materials

A new 104-page catalog/price list contains prices and technical information on 468 research materials. Covered are 50 metals in high and ultra-high purity grades and 18 standard alloys. Ceramic materials including oxides, borides, carbides, nitrides, and silicides are also covered. Sections of the catalog are devoted to a number of useful conversion charts on technical data sheets. General information on analytical techniques used to measure material purity is also presented. Materials Research Corp.

CIRCLE NO. 640

NEW WAY TO GET A HANDLE ON CONSTANT CURRENT ... 0.1 AMPERE TO 1 NANOAMPERE

Now you can keep tight rein on low level currents for materials research, semiconductor testing and for other areas in science and industry where a reliable current source is needed. The Keithley 225 delivers from 0.1 A to 100 nA full scale with 0.02% resolution on most ranges. It keeps them on target with 0.02% stability and low 0.01% rms noise. Variably selectable compliance voltages from 10 to 100 volts and 0.005% load regulation wrap-up this neat source for really constant currents.

Consider convenience features like bipolar output, the ability to float 500 volts off ground, an output filter to deal with inductive loads. And, protection from overloads with automatic recovery. Now—can you afford to pass up such capability when it’s yours for only $595?

For technical literature and demonstration, contact your Keithley Sales Engineer. Or, Keithley Instruments, Inc., 28775 Aurora Road, Cleveland, Ohio 44139. Telephone: (216) 248-0400. In Europe: 14 Ave. Villardin, 1009 Pully, Suisse. Prices slightly higher outside the U.S.A.
Terminal blocks
A complete line of barrier terminal blocks and accessories is described in a twenty-four page illustrated catalog. It lists over 1200 units, covering 22 basic types. Shown is data on voltage, current and wattage ratings, insulation materials, terminal styles and finish options, types of fanning and marker strips, and other accessories. Complete dimensional specifications and drawings are also included. Featured are blocks with a molded-in barrier between each adjacent terminal. Cinch Manufacturing Co.

Dynamic analysis
Thirty applications for a wide variety of analysis and control systems are described in detail in a new manual. The analysis is performed with a frequency-tuned narrow-band filter instrument. It extracts amplitude, frequency and phase information from raw data signals from 1 to 50,000 Hz. The analysis of random and periodic signals or total response for magnitude and phase data is discussed. Block diagrams show how the instrument performs in many types of analysis systems. Spectral Dynamics Corp. of San Diego.

Socket catalog
A complete line of high-reliability sockets are described and illustrated in a new 16-page guide. The line includes 14 and 16-pin DIP sockets, and transistor, tube, relay and crystal sockets. Included are complete specifications, descriptions, and dimensional drawings. Featured are two types of DIP sockets: a low-profile low-cost model and a versatile heavy-duty type with replaceable contacts. Both incorporate double-leaf contacts for positive wiping action. Elco Corp.

D/a converters
Three sections that are devoted to digital-to-analog converters are included in a comprehensive 28-page handbook. One section provides basic theory on d/a converters including typical circuits and definitions of key parameters. Another section describes a wide variety of applications for such devices. A third section describes a new line of ultraminiature d/a converters. Comprehensive mechanical and electrical specifications on 16 models of four series are included. Datel Corp.

Nickel cadmium batteries
Three new plastic-container batteries in 320, 350, and 415 ampere-hour capacities and a line of long-rate nickel cadmium storage batteries are described in a new specification catalog. It includes complete performance data for 15 plastic-container batteries and 19 steel-container batteries, ranging from 10 to 1245 ampere-hour capacities. Also included are typical discharge curves, at 1, 3, 5, 8, and 10-hour rates. Dimensions for all cell types and data for long-duration discharges of up to 100 hours are also included. NIFE Inc.

Miniature hand tools
A complete line of miniature hand tools, designed and manufactured to industrial standards, is shown in a 36-page tool catalog. It includes specifications, prices, descriptions and photographs of such tools as pliers, nippers, tweezers, scissors, shears, screwdrivers and nutdrivers. Also included are pin vises and holders, knives, scribers, soldering accessories, hammers, mallets and magnifiers. The catalog contains a complete index, a wire-cutting chart and introductory sections on how to select the right tool. Electronic Tool Co.

Lafayette catalog
Catalog 703, the 1970 spring publication from Lafayette Radio Electronics Corp. is now available. The 116-page book features citizen's band equipment, stereo-fidelity systems and components, portable radios, televisions, speakers, multi-track tape players and stereo headphones. Also featured are intrusion alarm systems, voltmeters, auto audio accessories, public-address systems, cameras, musical instruments and experimenter's kits. Lafayette Radio Electronics Corp.
Sample-and-hold circuit

A new sample-and-hold circuit that offers a combination of high speed and accuracy is described in a four-page brochure. The high accuracy of 0.01% is achieved by a unique circuit that compensates for the dielectric absorption losses in the capacitor. The circuit's high input impedance of $10^{11} \Omega$ eliminates errors due to a finite source impedance. Data Technology Corp.

CIRCLE NO. 649

Chip amplifiers

A series of high-speed sense amplifiers in chip form is fully described in an eight-page brochure. Three configurations of the series are shown with their electrical characteristics, recovery and recycle times and logic diagrams. Also shown are schematics that contain component values. Absolute maximum ratings are given and package designs are illustrated. Several typical characteristic operating curves are also shown. Silicon General, Inc.

CIRCLE NO. 650

Potentiometers

Complete information on a new series of potentiometers is available in a 20-page catalog. It provides electrical and mechanical specifications on commercial composition variable resistors. The resistors are 15/16 in. in diameter and range in power ratings from 1/4 to 3/4 W. A special two-page spread on attached power switches includes a choice of five new rotary switches. CTS Corp.

CIRCLE NO. 651

Complete Production Package Tailored to Your Requirements

ROBINTECH

Offers controlled quality printed circuit boards manufactured to your specifications ... from design to high volume production.
Plated through holes, uniform drilling, consistent production, fabrication to order, and expert assembly ... all in one complete package.
Uniquely modern facilities for all aspects of printed circuit board manufacture are at your service.

Send sketch and your requirements for design recommendation and quotation.

ROBINTECH electromechanical division

3465 Vestal Road, Vestal, New York 13850
phone: (607) 798-5011
P.O. Box 215, Bodle Hill Road, Owego, N.Y. 13827
phone: (607) 754-0410

Manufacturers of Flexible Shafts and Push-Pull Mechanical Remote Controls; Custom Electromechanical Assemblies and Electric Wiring Harnesses; Printed Circuit Boards; Shock Control and Vibration Isolation Systems.

INFORMATION RETRIEVAL NUMBER 799
NEW LITERATURE

Transformers
Specifications and application material on a new line of miniature transformers are included in a six-page catalog. Transformers featured exhibit a very-low insertion loss over a wide frequency range of 0.1 to 700 MHz. Impedance transformations include 50 Ω to 12.5, 25, 50, 100, 200 and 800 Ω. Six of the transformers are balanced types and four are single-ended types. Each is packaged in a high-temperature epoxy container or a hermetically sealed TO-5 case. Relcom.

A/d converters
Six different analog-to-digital converters are described in a four-page brochure. Presented are performance details, engineering specifications and inter connection pin assignments. A concise theory of analog-to-digital converter operation is also included. The converters described include 10, 12 and 13-bit binary units, with or without amplifier inputs. Data Technology Corp.

Electronic housings
Completely simplified for easy access to information is a 32-page catalog with an extensive line of metal housings for electronic instruments and systems. It is both graphically and photographically illustrated with dimensions, specifications and exploded views. Included are new modular cabinets, cabinet wedges, pedestals and two-toned textured vinyl-finish assemblies. Par-Metal Products Div. of EON Corp.

Radar components
Radar modulator components such as pulse forming networks, pulse transformers, modulators, charging reactors, and power supplies are covered in a new 16-page booklet. Physical and electrical characteristics for nearly 30 typical and special-purpose components are described. Effective approaches to interfacing problems associated with modular components are also discussed. Capitron Div. of AMP Inc.

Data processing
Six different data processing services are described in a new 20-page brochure. They include timesharing, and remote batch and on-site batch data processing services. Also included are contract software, systems consultation and management services. Each of these services is discussed in detail and is offered by data centers located in 16 cities in the United States. Honeywell Information Services Div.

Digital multipliers
A comprehensive eight-page data sheet provides detailed information on the new series of 5400 digital multimeters. Features found in these four-digit instruments include a new computing rms ac measurement technique. In addition, complete specifications, options, modules, and accessories are included. Dana Laboratories, Inc., Measurements Div.

Dry-reed switching
Written by a staff engineer in a reliability laboratory, a new 60-page handbook entitled “A Guide to Dry-Reed Switching” details important facts about dry-reed switching. It points out how excellent solutions to specific switching problems can be obtained. Proper solutions can be achieved provided relay characteristics and limitations are recognized, understood, and applied within their specified ratings. Automatic Electric Co.
ECL gates

Applications of ECL (Emitter-Coupled-Logic) basic gates in ultra-high-speed digital systems are covered in a 12-page booklet. It includes seven basic gate modules of the ECL-2500 integrated-circuit series. Contained are several gate module features, including a typical propagation delay of 2.5 ns with a high noise immunity of ±225 mV at 25°C. The seven modules described contain various combinations of the basic ECL gate. Electrical and typical operating characteristics, parameter measurement information and mechanical data are amply shown. Texas Instruments.

CIRCLE NO. 661

Instrument cases

An extensive line of standard and custom instrument cases, thermoformed from plastics, is described and illustrated in a new catalog. Designed for commercial and military applications, they are available in 35 standard off-the-shelf configurations. Optional features offered to meet custom requirements include special hinges, valves, bumpers, and handles. Custom interiors are detailed, such as flexible foam, mechanical vibration and shock systems. Part numbers, dimensions, illustrations, outline drawings and other specifications are included. Skydyne Inc.

CIRCLE NO. 662

Chemicals and metals

The 1970 edition of Alfa Inorganics catalog contains 424 pages of inorganic, organometallic and ultra-pure chemicals and related materials for research. Five different sections are color-coded for quick and easy reference. This catalog is a handy reference for research scientists in chemistry, electronics, physics optics and related disciplines. New items include 70 different metals and refractory and ceramic discs. Alfa Inorganics, Inc.

CIRCLE NO. 663
Design Data from

PRECISION CARBON FILM RESISTORS

High Voltage . . . High Frequency . . . High Megohm . . . complete specifications for 120 devices and "The Case for Carbon Film" are presented in this new 1970 resistor catalog. Resistors are offered in 15 basic styles, ranging from .25 to 100 watts, with over 100 special variations available. Resistances range from 10 ohms to 100 Terohms and tolerances from ±1%. Applications include those requiring high resistances, voltage capability from 250 to 125,000 V, and high frequency or pulse circuits. Send for free catalog and engineering data.

FUNDAMENTALS OF INTEGRATED CIRCUITS

A practical guide to integrated circuits, their theory, manufacture, and applications. This new guide by Lothar Stern offers compete, highly readable coverage of the various techniques of circuit fabrication, and their effect on circuit design and performance. As to marketing considerations, it compares the characteristics of the numerous IC structures devised to date in terms of economics and logistics. A volume in the Motorola Series in Solid-State Electronics. 198 pages, 7 x 10, illustrated. $8.95, clothbound. Circle the reader-service number below for 15-day examination copies.

Clamp or Tie Wire Bundles In Seconds!

Six-page catalog contains complete ordering information for CAB-L-TITE® clamps and BUND-L-TITE® straps, devices which provide a fast and reliable means of securing wires and wire bundles. Units withstand loadings greater than 50 G's, are removable in seconds for re-routing wires, and are self-locking—no tying, no knots, no hitches to come loose. Lightweight Du Pont Zytel meets MIL-P-17091 and MIL-P-20693. Proved in aircraft and missiles. Photos, dimensional drawings, tables, physical properties, specifications, price list. Request catalog A.

HOW TO SUCCEED WHILE YOU’RE STILL YOUNG

The average engineer — despite a high starting salary — hardly ever reaches $20,000 a year. Recent surveys indicate that the average engineer earns only $15,500 at today's salary levels. But middle management engineers expect salaries up to $30,000 . . . and young middle managers are still promotable! The Alexander Hamilton Institute representative can tell you the exciting story. But first, find out how you, too, can qualify for the highest rewards in industry. Send for our FREE booklet, “Forging Ahead in Business.” Act now. No obligation.

New York, N. Y. 10017

PEM Preassembled Captive Screw Fasteners

PEM self-clinching panel fasteners are completely preassembled with captive screw, spring and retaining washer in stainless steel retainers ready for permanent mounting in panels as thin as 0.060". Knurled and slotted captive screws with tapered leads can be removed if desired from their permanently mounted retainers. Send for free PEM bulletin describing self-clinching, preassembled panel fasteners in thread sizes #4-40 through 1/4-20. Each thread size is available in three screw lengths.

**Electronic Design** 6, March 15, 1970
The first new styling innovation in fifteen years! 900 Series Snob Knobs come in four bright, handsome models. Spun aluminum cap. Spun aluminum inlay. Decorative metallic ring. And Black. From 1/2" to 1 1/4" diameter.

Kurz-Kasch is known as the quality knob source by electronics manufacturers the world over. If you're not familiar with the outstanding Kurz-Kasch line, we'll send you a complete catalog. And if you're just anxious to see the new Snob Knob, we'll send you a free sample.

Kurz-Kasch, Inc.

INFORMATION RETRIEVAL NUMBER 781

"IT'S GOOD BUSINESS TO HIRE THE HANDICAPPED."

Isn't that a great idea, Snoopy?

THE PRESIDENT'S COMMITTEE ON EMPLOYMENT OF THE HANDICAPPED, WASHINGTON, D. C.
# Information Retrieval Service

New Products, Evaluation Samples (ES), Design Aids (DA), Application Notes (AN), and New Literature (NL) in this issue are listed here with page and Information Retrieval numbers. Reader requests will be promptly processed by computer and mailed to the manufacturer within three days.

Dale puts the power in thick film networks

Dale makes thick film R-C networks as standard as this dual-in-line package and as small as this 1/4-inch square model. Within this broad capability we've become known as power specialists. Our ability to work with substrate, heat sink, package density and all the other network variables lets us deliver the power you need—in the size you need. "Big" jobs like the one shown above (5" x 2-1/2", 20 resistors, 60 watts) don't scare us a bit. Whether your next network is tremendous or tiny, give us a shot at it.

PROTOTYPES ON MOST DESIGNS IN LESS THAN THREE WEEKS...Call 402-564-3131 for complete details or write for Catalog A.

GENERAL NETWORK SPECIFICATIONS

Temperature Coefficient: ±250 PPM max. from −55°C to +150°C. T.C. as low as ±50 PPM in limited resistance ranges.

Tolerance: Standard ±10%. As low as 1% when required.

Power Loading: 16 watts/in.² standard with aluminum oxide substrate .015"-.040" thick. Substantially higher with heat sinking and beryllia substrates.

Terminations, Conductors and Land Areas: Platinum gold, palladium gold, gold and silver, depending upon application. Crossovers can be made. Lands for attaching active or passive components can be provided.

Resistor Patterns: Thick film resistive materials with resistivities from 1 ohm/sq. to 1 megohm/sq. can be used. Patterns can be made from 1/10 square to 10 squares.

Capacitors: Screened = .01 μfd/in.²; Chip = up to 5 μfd ±10% to ±20% or GMV. Dissipation Factor = Less than 1.5%. Working Voltage = 50.

Packaging: Dual-in-line packaging can be used with plated Kovar or other types of leads. Also conformal coatings can be applied to modules with wire or ribbon leads. Screened and cured silicone coatings can be used to protect specific areas of the circuit.

DALE ELECTRONICS, INC.

In Canada: Dale Electronics Canada, Ltd.
A Subsidiary of The Lionel Corporation

INFORMATION RETRIEVAL NUMBER 181
It's time for a change in your digital displays! Increase versatility, decrease costs—with RCA's new NUMITRON Digital Display Devices

Compare these RCA product advantages:
- Sharper, cleaner displays
- Controllable high brightness
- Up-front planer numerals for wider viewing angle
- Unlimited filter-color selection
- Low voltage operation—designed for 4½ V
- Fully compatible with RCA's new Integrated Circuit Decoder/Drivers

- Rugged construction
- Long life—high reliability
- Designed for low-cost 9-pin miniature sockets

Interested? For more information on the new RCA NUMITRON Digital Display Devices, contact your local RCA Representative or write to RCA Electronic Components, Commercial Engineering, Section 38D182, Harrison, N.J. 07029. Also ask for data on the new RCA Integrated Circuit Decoder/Drivers, especially designed for use with RCA's Digital Display Devices.
Type Numbers of NUMITRON Digital Display Devices:
- RCA-DR-2000—Numerals 0 through 9
- RCA-DR-2010—Numerals 0 through 9, with decimal
- RCA-DR-2020—Plus-Minus and Numeral 1
- RCA-DR-2030—Plus-Minus

Unretouched photograph of operating NUMITRON devices mounted on plastic tubing.
