How far could you be a year from today at Xerox?

We can only give you an idea.

Because when you join Xerox, it's the beginning of an unpredictable interaction. You, with your unique set of interests and abilities. And Xerox, with EDP involved in nearly every phase of our operations.

You might start programming in sales, with systems analysis an increasing part of your job. Or manufacturing, where developing disc-oriented software might be a big part of your work. Or accounting, market research, or engineering where the scope is equally as broad and tangents interesting. Too, you'll get exposure to a variety of sophisticated systems, like our integrated Production Planning and Inventory Control System that oversees everything from inventory and bills of material to scheduling and workload distribution. Or, perhaps work on a long-range strategic competitive planning model.

As you become involved, you'll go deeper and deeper into the many phases of our operation...discovering how vital EDP is to Xerox. And uncovering—or discovering—areas where EDP's never penetrated.

The possibilities are intriguing. So is the potential. Because the kind of EDP exposure Xerox offers can open many doors to advancement. To programming specialization. Systems analysis. Functional specialization in one of the areas in which you've become interested. Even into management.

A college degree and/or experience with IBM 360 series systems using COBOL, the Univac 1108 using FORTRAN or COBOL, or IBM 7000 series using COBOL or AUTOCODER is desired. If you are interested in this rapidly growing field, give us the opportunity of listening to your ideas and aspirations.

These openings are in Rochester, New York. Please send your resume to M. H. Hartigan, Dept. MZ-69-N1, Xerox Corporation, P.O. Box 1995, Rochester, New York 14603.

An Equal Opportunity Employer (m/f)
What would you do if your top programmer were activated tomorrow?

Without instant documentation for your programs you'd be in trouble. That's where our Quick Draw comes in. Quick Draw is a programming tool that uses the power of your own computer to produce documentation for your programs. It produces flow charts, format listings, and cross references to data names and paragraph names. And it does it faster than your programmer could hope to. So last, in fact, you save up to 30% of present programming costs. Quick Draw was developed especially for use with COBOL, FORTRAN, BAL, as well as other assembly languages. And it's applicable for most computers. Interested in having a reserve force of your own? Just send the coupon. No obligation of course.

Tell me more about Quick Draw.

"It's devilishly clever"

"What is?"
"The New Cummins Planax continuous form perfect binding system!"

"Prove it!"
"Send for the brochure. It tells the full Planax story!"

Now Cummins makes the original office adhesive binding system—Planax Perfect Binding—available in the United States for the first time to offices of all sizes. The simple, low-in-cost Planax system eliminates the need for binderies using expensive, complex equipment. Developed in Germany a few years ago by a bindery equipment manufacturer, the Planax system swept across Western Europe. The Planax binding system is practical for all binding requirements...even those which are now handled less effectively with rings, staples or other gadgets. No other method so efficiently provides the features of perfect binding...edge-to-edge visibility, flat book opening, and the strength necessary for permanent records. Planax is also more economical, both in original cost as well as in operation. It's available in colors, too.

Devilishly clever? We can prove it with a demonstration. Request the new Planax brochure, or look in your phone directory under Cummins-Chicago and call for an actual demonstration.

CONTROLLED CIRCULATION POSTAGE PAID AT MADISON, WISCONSIN

Software Age
You probably aren’t our kind of engineer.

No offense intended. We just know what we want.

We’re computer memory specialists. If you know our products, you know we’re good.

Not surprisingly, we’re growing fast.

So we need engineers. Good minds. Good technical backgrounds. But that’s not all.

You see, back when we were small we learned an important lesson. Each of our engineers had to get involved in everything: research, design, costing, marketing, production—you name it. Being involved, they became committed. And worked better for it.

That’s how we got our reputation for doing what we do better than anyone else. We intend to keep it.

That’s why we take such a close look at all applicants for our engineering positions. We’ll talk to you about interests and aspirations and experience. And, at some point along the line, we’ll draw this diagram:

![Diagram showing Marketing, Business, Engineering, and a circle in the middle]

It’s the essence of what we mean by our kind of engineer. An interest in and understanding of all aspects of our company’s activities. You could call it balance. Whatever it is, it works for us.

What can we offer you?

First, a good salary. (We want the best and we’re willing to pay for it.)

Second, the opportunity to advance rapidly along either engineering or administrative lines. (Lots of outfits will tell you this, then stick you in an isolation ward. We mean what we say.)

Third, the opportunity to grow with the best engineering staff in the industry.

Fourth, the satisfaction and pride of seeing the products you work on produced and sold.

We make memory systems and stacks and planes and printed circuits. We’re looking to the future with research in plated wire and films. And we’re in the process of introducing a brand new product: MAC 16, a compact, inexpensive Multi-Application Computer. Our division is going to keep right on growing. And we’ll need even more of our kind of engineers.

If we sound like your kind of company and if you have an M.E. or E.E. degree and computer-related experience, let’s get together.

Write me a letter: Mr. E. A. Gage, 6201 E. Randolph Street, Los Angeles, California 90022. Or, call me collect at (213) 722-6810.

Naturally, we’re an equal opportunity employer.
Programmers, Systems Analysts...

"imagination spoken here"

Univac is looking for programmers and systems analysts.
But not just any kind of programmer or systems analyst.
We're looking for men who understand why sometimes you must fail before you can succeed.
Men who understand that programming is an art, not a science.
Men who can think beyond today. And maybe even beyond tomorrow.
In short, men with that important extra ingredient: imagination.
If you're that kind of man, we'll give you, in return, all the work you could want. And all the challenge you can handle. Plus our important extra ingredient: unlimited opportunity.
Think it over. Think whether your current employer really cares about imagination. Then think Univac, where we speak imagination as fluently as FORTRAN.
For more details, write Federal Systems Division or Data Processing Division...
A new hand punch designed for punching mylar tape in electronic data processing is now being marketed by the P. J. Mieth Manufacturing Company, manufacturers of the complete line of Punch-Rite® punches for military, commercial and industrial applications. The special Mieth punch features a "fixed" reach to always position the punching apparatus in the center of 1/2" wide mylar tape, thus permitting the tape to be easily attached to a take-up reel. Capable of punching either a 1/8" triangular shaped opening or a 3/16" circular hole, the unique 5R-T punch also provides a receptacle for catching all the punch-outs or clippings.

Presently available as a special order item, Mieth's new mylar tape punch can be supplied within a maximum delivery time of 3 weeks.

Development of Information Systems is the title of a new book by Donald F. Heany, consultant in the area of advanced management Sciences. The book, published by Ronald Press, New York, is the newest (and one of the more successful) attempts to bridge the communications gap between those management people who need information and those data-processing people who must provide it. Written more or less "down the middle of the road," the book will give EDP specialists some insight into what management needs to know, and why, and give managers some insight into the problems involved in providing the information they need. Winds up with an excellent glossary and bibliography.

For more information, circle No. 51 on the Reader Service Card

Digital magnetic tape storage and speed conversion device is capable of accepting and storing digital information and transmitting it as required at the necessary speed and format. The "Digi-Buffer" uses independently-controlled dual capstan drives, one for recording and one for reading. Information is stored on a loop of standard magnetic tape; Model MS 200 is capable of storing 40,000 characters while Model MS 3000 stores up to 250,000 characters. Speeds are 0 to 200 WPM and 300 WPM respectively.

The capstans utilize the unique characteristics of the DC printed motor for high speed synchronous or asynchronous incremental operation. The tape is driven directly from the motor shaft without the use of pinch rollers, brakes or clutches. No pressure or shock is applied to the tape, preventing tape damage or the loss of information. Tape life is increased and frequent adjustments and repairs are eliminated.

Typical applications are data storage, speed conversion and data filing. With the proper interface it may be used with electric typewriters, card and paper tape readers and punches, tabulating machines and as an input/output device for computers.

A METHOD OF SOFTWARE-CONTROLLED ERROR RECOVERY PROCEDURE TESTING FOR THE DOS/TOS SYSTEM/360

R. A. Greene
Systems Development Division
IBM Corp.
Endicott, New York

ABSTRACT: The development of the Testing Error Recovery Procedures (TERP) program was a successful pioneer effort in the area of software-controlled Error Recovery Procedure (ERP) testing. TERP met the need for a standard method of ERP testing and satisfied the requirements of both the error recovery procedure programmer and the systems test programmer.

TERP is an ERP test case generator. Test cases generated by TERP can simulate I/O errors and machine check errors. TERP provides self-checking facilities which aid in the verification of test case results. The writing of ERP test cases is minimized by coding in a macro language because TERP is implemented through the use of assembler macros. The time required for testing ERP is also considerably reduced because there are no prerequisites or special operating procedures for executing TERP test cases.

A standard method of DOS/TOS ERP testing has been established through the use of TERP. Although TERP was developed around a specific operating system, its underlying principles can be applied to testing error recovery procedures of operating systems in general.

I. INTRODUCTION: This paper describes a procedure for testing the error recovery routines of an operating system. Although the procedure was developed around a specific operating system, namely DOS/TOS System/360, the underlying principles can be applied to testing error recovery procedures of operating systems in general. It is assumed the reader possesses a basic knowledge of the System/360 hardware and software at the DOS/TOS level.

Testing the error recovery procedures of an operating system has traditionally been an area which has not lent itself to the standard systems testing approach. This standard approach is the creation, through software, of a given set of conditions to be presented to the operating system and the verification, through software if possible, of the correct reaction by the operating system to these conditions.

The awkward characteristics of previous ERP testing methods, such as hardware fixes, core patches, special system generations, etc., often resulted in wasted time and incomplete testing. Simulation techniques were developed, but due to the nature of their implementation, they were also time consuming. In short, there was clearly a need for a standard method for ERP testing which satisfied the requirements of both the development programmer and the systems-test programmer. A method was needed which, due to its tailored implementation for ERP testing, reduced to a minimum the effort involved in generation, execution, and evaluation of ERP test cases.

This lack of a standard method for ERP testing led to the development of TERP. TERP is a tool for generating ERP test cases which conform to systems testing standards. Test cases generated by TERP can simulate I/O errors and machine check errors. TERP also provides self-checking facilities which aid in the verification of test case results. The writing of ERP test cases is minimized by coding in a macro language because TERP is implemented through the use of assembler macros. The time required for testing ERP is also considerably reduced because there are no prerequisites or special operating procedures for executing TERP test cases.

This paper explains in detail the TERP logic and function of the TERP components. It outlines existing TERP applications and furnishes information necessary for generating software-controlled ERP test cases with TERP.

II. TERP IMPLEMENTATION
A. TERP PHILOSOPHY

The TERP philosophy is to provide a means for ERP test case gen-
eration which permits software-controlled testing in conformity with the standard systems testing approach.

B. TERP METHOD

TERP is written in the System/360 assembler language and is implemented under DOS/TOS through the use of two B-transients and six assembler macros.

The basic TERP test case logic is as follows:

1. Initial ERP test case entry code fetches a B-transient which dynamically establishes an interface for error simulation between the supervisor being tested and the TERP, macro-generated, I/O interrupt monitor.

2. Control is then returned to the ERP test case which requests, through use of TERP macros, simulation of a specific error.

3. The TERP I/O interrupt monitor or machine check simulation routine next interfaces with the supervisor and simulates the specific error requested. The monitor may contain an optional I/O trace facility which aids in verification of commands issued by system ERP.

4. The number of system ERP retries attempted to correct the simulated error is logged upon test case termination, if cancellation occurred, or after error simulation, if cancellation did not occur.

5. If test case cancellation did not result from the supervisor's handling of the simulated error, the ERP test case proceeds to normal completion or attempts additional error simulation.

6. Upon termination of the ERP test case, the system EOJ routines fetch a B-transient which dynamically returns the supervisor to its normal operating state by removing the TERP interface.

C. TERP COMPONENTS

The two TERP B-transients must be cataloged in the core image library at ERP test case generation time. Appendix A contains a detailed description of the TERP components.

1. TERP B-transients

a. $$BSTIOP. This B-transient is fetched and executed only at initial ERP test case entry. It dynamically establishes an interface between the supervisor being tested and the TERP I/O interrupt monitor. This interface permits I/O error simulation. In addition, $$BSTIOP changes the system EOJ B-transient name stored within the supervisor to the TERP exit B-Transient name, $$BMEXIT. This causes the TERP exit B-transient to be fetched by the system at either normal or abnormal test case termination. $$BSTIOP exits by returning control to the ERP test case.

b. $$BMEXIT. This B-transient is fetched by the system EOJ routines and is executed only at ERP test case termination. It dynamically returns the supervisor to its normal operating state by removing the TERP interface and restoring the system EOJ B-transient name. In addition, if test case cancellation occurred, $$BMEXIT logs the number of system ERP retries attempted to correct the simulated error. $$BMEXIT exits by fetching the system EOJ B-transient.

2. TERP Macros

a. IOCTL. This macro must be the first source instruction in the ERP test case. IOCTL generates the following code:

(1) Initialization Routine. This routine is entered only at test case initiation. It performs initialization and fetches $$BSTIOP. Upon return from $$BSTIOP, processing continues with the next sequential instruction following the IOCTL generated code.

The head-hunting expeditions of E. B. Schultz have made him a legend in the field of EDP. As a one-time Employment Manager for a big-time computer builder just across the river, he was known to go far and wide to track down the one man who could fill all the requirements of a particular job. Now, as VP in charge of Career Development at DMS, E. B. is really beating the bushes. Our company clients are expanding current programs and adding new systems like crazy. Providing them with a complete package of Research and Planning, Educational Programs, Programming Services, and Equipment Acquisition is the bulk of our business. It's up to Schultz to provide the brainpower. If you're a rare breed of applications or systems programmer, systems analyst, product planner or salesman, make yourself known. E. B.'s top drawer is a treasure chest of career opportunities. The kind you'll never find by going through customary channels. Send a resume. Or call collect. (215) 816-6091.
Don't judge the entire systems programming field by where you're working.

It's a different world at RCA.

It always has been. And it always will be. That's because we realize that the strength of any company is no greater than the manpower it employs.

At RCA, the emphasis is on opportunity. And challenge. We'll give you a variety of projects to work on, an important say in hardware design, and above all, people to work with who believe in themselves as well as their work.

Write to us if you've had experience in language processors, operating systems, utility systems or communications systems.

We also have openings in Sales, Field Systems Support, Product Planning and Engineering.

Contact Mr. J. Looney, Dept. SW-8, RCA Information Systems Division, Bldg. 202-1, Cherry Hill, New Jersey 08101. We are an equal opportunity employer.
Scientific Programmers

Use your imagination.

Imagine the thousands of intricate problem-solving programs leading up to the C-5's recent first flight. The programs required for design and development of projected C-5 derivatives. For nuclear applications research. And for VTOL design.

Lockheed-Georgia needs Scientific Programmers for these and other on-going projects. Requirements:
a degree in engineering, mathematics, or a science;
plus two or more years experience programming large scale computers for the solution of scientific and technical problems.

Expand your imagination at Lockheed. Send your resume to:
Mr. U. D. McDonald, Employment Manager, Dept. SA-12,
Lockheed-Georgia Company, 2363 Kingston Court, S.E.,
Marietta, Georgia, 30060. An equal opportunity employer.

Payroll Systems go on-line faster with ALLTAX™
the software package available in basic COBOL
for all compilers.

ALLTAX calculates payroll withholding taxes with one standard formula and a table of variables for each state and city. It eliminates programming of individual formulas and substantially reduces program maintenance and memory requirements.

ALLTAX is approved by all states. It's easy to install, completely tested and documented.

ALLTAX is always up-to-date. Automatic program maintenance for existing withholding taxes and new taxes is available at minimal cost.

Find out why more than 100 companies from coast-to-coast are using this low-cost package.

Programmers—We know where you can find a better job.

Work in the most dynamic EDP community in the country where the nation's top companies are hungrily looking for skilled programmers. Like you.

Personal and professional growth is rapid. Salaries are high and the diversification of opportunities is unsurpassed.

We know, because Drew is New York's leading EDP placement specialist. We work closely with over 300 national companies headquartered here who have exciting programming and systems openings. Applications programmers, systems programmers, software programmers—are the people these companies need. Drew has been chosen to supply them with the necessary talent.

Send us your resume and we'll give you the inside story on all of these openings.

Do it today. This could be the start of bigger and better things.

Systems Programmers and Systems Analysts:
Give IBM a hand and we’ll try to make it a free one.

If predictable thinking were what we wanted, we’d just program it. But what we’re looking for are imagination and ingenuity. If you have these qualities, and you qualify for a job with IBM, you can be sure you’ll get to use them.

Immediate openings
We have immediate openings in these areas of data control:
SYSTEMS PROGRAMMING—You could work close to the system, very much into its own particular nuances and idiosyncrasies, and adapt programs to maximize the data processing potential of the computer. Or write entirely new programs to link the actual problem to its solution.
Or you could develop symbolic languages for both commercial and scientific use, and concern yourself with computer performance, serviceability, systems analysis, component evaluation, and the development of diagnostic programs.
SYSTEMS ANALYSIS—Because you’re close to the problem, its thorns and its kinks, your job is creating an overall data processing strategy that solves it.
The problem itself could be just about anything: payroll, inventory control, process control, long-range financial forecasts—to name a few.
A Bachelor’s degree and one year’s experience are required for the above positions.

Grow with IBM
Today’s major growth industry is information handling and control. And IBM is a leader in that field. As a result, the professional challenges at IBM are more demanding, more sophisticated than ever. Our job is to help our customers solve their information-handling problems. And IBM people are at work helping them solve a myriad of problems from diagnosing a strange disease to urban redevelopment.
So if you’re a problem-solver who wants a personal sense of achievement and recognition for your hard work in an exciting growth company, consider IBM.

Write us now
Jerry Hinkley is the man to talk to. Write to him at IBM Corp., Dept. BM1020, 24th Floor, 425 Park Ave., New York, N.Y. 10022.

An Equal Opportunity Employer
Collins' New Data Program
Creating New Opportunities

Collins' C-8500 C-System gives users the first completely integrated system with virtually unlimited expansion capability. This new concept in computer applications is creating exceptional career opportunities for: Programmers, Hardware Diagnostic Programmers, Circuit Design Engineers, Memory Design Engineers, Digital System Engineers, Digital Systems Analysts, Logic Design Engineers, Mechanical Engineers, Data Systems Analysts and Applied-Systems Analysts/Programmers.

Engineers, Physicists, Mathematicians, and those with degrees in other physical sciences (1 to 5 years experience) will find an outstanding opportunity to learn and progress rapidly in the data field, even without previous data experience.

Please send resume in confidence to Manager of Professional Employment, Collins Radio Company, Dallas, Texas 75207; Cedar Rapids, Iowa 52406, or Newport Beach, California 92663.

Join the
Montgomery Ward re-generation

Multiply your capabilities
...multiply your rewards.

How do you computerize a conglomerate of stores, products and catalogs—all generating fast-moving challenges in distribution, credit, inventory control and other related areas? Montgomery Ward does it with retailing's largest 3rd generation data control center—and with a programming effort aimed at attacking a total management information system from 8 different areas simultaneously!

Essentially, an operation as fast and furious as this does three things for a programmer or systems man: (1) it generates continuous new challenges, (2) it continually expands and regenerates his capabilities, and, (3) it multiplies his rewards in terms of increasing responsibilities and earnings.

If you have two or more years COBOL or BAL experience and would like to enlarge upon it fast, make your move now to join Montgomery Ward. Write: M. K. Fenwick, Personnel Representative/Corporate Systems Division.

VI. Variations in the Test System

A. Straightforward Modifications

A number of extensions of the test system are worthy of mention at this point.

First: the test point data, which was generated in dc analogue format, was converted or quantized into five different voltage ranges. These ranges can be reduced to three (HI-LO), or increased to almost any desired extent. Each range is presented is a different color in the visible matrix. For a limited number of steps, discrete color producing phosphors are used on the face plate of the CRT. For a substantial number of steps, the plurality of colors are generated more suitably by varying the excitation relative to each other of three different primary color producing phosphors. Thus, instead of using five discrete colors in the display (white being one of the colors) the three primary colors may be used in varying proportions to generate red, orange, white, yellow, and green colors. This method is increasingly advantageous as the number of quantized levels is increased.

Second: instead of using a rear port for optical projection of the data stored on the film transparency, a second electron gun can be incorporated in the CRT to be energized by a flying spot scanner which has as its input the same film strip.

Third: instead of using punched cards, the failure selection slots and informational data may be recorded magnetically on cards, or on tape, drums, discs, or cores.

Fourth: the scan rate may be altered, or the test system may be time-shared to better suit the needs of testing. Thus, if the assembly under test has a high inertial mechanical or thermal component there may be no need to sample the data 60 times each second.

Fifth: devices other than CRT's can be used for display purposes especially if the rate of data presentation does not require high resolution and high scanning speed.

B. Color Synchronism

Suppose the twelve different test voltages to be displayed on the first line of the 8 x 12 matrix are not steady in value, but that they vary at a rate slow in comparison to the sampling time of 16.6 milliseconds. Suppose further that all voltages vary in magnitude at the same rate. Then, the twelve points in the line will change color in synchronism to yield a pleasing visual sensation.

This often may be desirable from the observer's point of view, but as the Test System is now arranged it will trigger the camera unit. Since the system is functioning properly the camera unit should not be energized, and therefore this line of data will have to be masked from the color-sensitive photo-cell detector. This can be done by providing suitable gating circuits synchronized with the raster scanning, or it can be done by mechanical masking means. Alternatively, a properly phased reference voltage varying at the same rate as the data can be supplied to the comparison network for these twelve points of test data so that the uniform white matrix of visual data is maintained.

C. The Blink Technique

Suppose now that a digital signal, rather than a sampled analogue voltage, is made to control the first line of the matrix. The color of the twelve points in the line will take on a given set of values which are representative of the twelve coded numbers. If the digital signal is repetitive the pattern of the color dots is stationary. This condition is apparent from visual inspection and is meaningful. On the other hand, if the digital data is rapidly varying, in non-cyclic order, then visual inspection generally will yield little information. To better interpret patterns of this type, a scanning raster is generated which may be considered akin to the blink microscope. As is well known from the field of astronomy, the repetitive flashing of two patterns in the field of view of an observer creates an image which enables the observer to detect quite small differences between the two patterns. In this manner, the planet Pluto was discovered after many years of comparing thousands of photographs of the sky.

This principle of the blink technique for pattern comparison is applied to compare two groups of test signals to each other. Thus, by way of example, an assembly under test is arranged to process a digital signal which activates all the components in the assembly. This digital test signal may be the test message "See the quick brown fox jump over the lazy dog's back" often used in teletype systems. The response of the assembly is picked off at some suitable point and is displayed bit by bit across the matrix pattern. When the test signal is made repetitive, and is timed to be in synchronism with the scanning of the raster which generates the matrix pattern, and with a stable response from the assembly under test, a fixed pattern is generated on the display device which is easily recognized. Furthermore, a typical overall response from such an assembly will have the input sig-
nals identical in character. Under these circumstances, the display is made to generate on the first scanning cycle a pattern representative of the input signal. On the second scanning cycle, the display is made to generate a pattern representative of the output signal. On the third cycle the input signal again controls the pattern, etc. Therefore the observer sees the alternate presentations of the input and output digital data in matrix format. If the input and output signals are identical, signifying proper operation of the equipment under test, the matrix of data reappears with each scan in a smooth and uniform fashion. On the other hand, if there is a lack of correspondence between input and output signals the observer will see a blink or color alternation, at the point in the matrix where the discrepancy exists.

D. Computer Tester

A digital computer serves as another example for demonstrating the usefulness of this color blink phenomena. In this case, special test programs are used to exercise the computer. For each programmed exercise a response is obtained from the computer which is compared to a predetermined response. Here again, the two responses are compared on a bit-by-bit basis across and down the matrix on the CRT display. Both the program and the correct response may be stored in the memory section of the computer, be it on magnetic drum, disc, core, or delay line. The test sequence and the response thereto is programmed from this memory section in synchronism with the CRT raster scanning cycle to provide a stationary pattern. On the first scanning cycle, the measured response is displayed; on the next cycle the "calculated" response is displayed; and so forth. Therefore, a discrepancy between the measured response and the predetermined response shows up as a color blink on the face of the CRT at each point in the matrix where a discrepancy exists. Since this condition reflects a failure mode, there is advantage in recording this failure pattern. Again, it is convenient to photograph the display whenever a blink appears. But since the matrix ordinarily is filled with a plurality of test data in different colors, a photo-cell detector responsive to these colors cannot be used to trigger the camera; and masking the CRT as earlier proposed will be ineffective. Instead, a parity check is made of the data from one scanning cycle to the next. This parity check consists of first counting the bits displayed for one scanning cycle to establish a reference count. Then, if the bit-count on the next cycle is the same, no photograph will be taken. If the bit-count is different, a photograph will record the matrix pattern. This is a much desired mode of recording the failure data for the camera is not triggered to take repetitive pictures of the same failure pattern.

To cite a simple example, let the digital data be in such format that a "yes" or "1" bit is displayed on a CRT as a green dot; and that a "no" or "0" bit is displayed as a red dot. These dots result from the excitation by the electron beam of a green phosphor and a red phosphor, respectively. For convenience in visual comparison, all color dots are produced by phosphors having decay times which are approximately equal. The first line of dots in the matrix is controlled by a first sequence of bits and therefore has a series of green and red color dots. The next row has a second sequence of green and red dots, etc. This display is used in the block diagram of Figure 6 where an arrangement is shown for checking the memory section of a digital computer. The scanning of the electron beam on the face of the CRT is synchronized with the scanning of the storage elements on a magnetic drum, a core matrix, or the like.

The readout of each bit of data in the storage medium is delayed in time so that the CRT displays a matrix of points which corresponds to the position at which the data is stored. This "electronic development" of the surface of the magnetic drum is repeated fast enough so that a steady image is seen by the operator. In between each scan of the data in the memory, there is alternately presented an image of the comparison data previously stored on a film chip.
Our National Computer Salary Survey and Opportunities Analysis.

This is it. The all-new 1968 edition of Source Edp's FREE 20-page Computer Salary Survey and Opportunities Analysis. It's a summary of computer salaries by 24 separate levels of professional and managerial experience ranging up to $75,000. Plus a comprehensive analysis of current trends in computer employment.

All of this information has been compiled, analyzed and put together by some of the most knowledgeable people in the business. The people at Source Edp. Source Edp is the only placement firm staffed by computer professionals for computer professionals. It's their business to know the data processing field.

To get your free copy of the 1968 Edition of Source Edp's Computer Salary Survey and Opportunities Analysis just circle the reader inquiry card.

EDP CONSULTING

We are a national consulting organization looking for articulate systems and programming analysts who want to stretch their horizons and knowledge in a truly professional atmosphere. As a management analyst advances within our organization, his assignments and training enable him to keep abreast of the most recent developments in the data processing field. You will also develop project management skills and acquire a broad knowledge of general business practices.

We require a minimum of 3 years experience in designing computer-related applications. Must be capable of designing on-line systems involving multiple random access files. Should have exposure to operating systems software and be knowledgeable about data management techniques.

Business background preferred which includes financial and manufacturing systems. Masters degree desired.

Initial compensation depends upon previous background, but we are prepared to pay up to $25,000.

Send confidential resume including present and required salary to:

S/A-1201
1020 Church St., Evanston, Ill. 60201

Software Age
otherwise regular pattern. Many techniques can be used for investigating this disturbance. The technique described entails the projection of a pre-recorded pattern upon the section of the test matrix where the disturbance is located. Another technique might use a second CRT where a blown up view is presented of the disturbed area. In an extremely large or major system where 600,000 points of test data are being generated, this greater amount of data can be displayed by improving the resolution of the CRT, by using a larger display, and by going to projection type CRT's. Alternatively, the test patterns may be controlled so that only those that are defective are transmitted for display. This transmission may be to a central monitoring station where it is desired to observe and evaluate the test results of the overall major system.

VIII. Conclusions

It should be evident from the foregoing that it is proposed, via these pattern recognition displays, to enhance the role played by operating and maintenance personnel in the day-to-day use of complex electronic systems by providing a more attractive man-machine interface. This might be done in the aerospace environment by time-sharing some of the lesser used displays already contained in the vehicle. For example, a display used for airborne rendezvous or for a blind landing system can be used for maintenance purposes for extensive periods of time without compromising its original intended application. There are undoubtedly other displays which can be used. If the original equipment display is small in size; then the data it is called upon to display is small; perhaps so that it only tests itself. This display of the data in block format makes it possible for judgements to be rendered which presently are not possible. The pattern recognition type of display lessens the need for the numerous dials and digits that are characteristic of present maintenance efforts. The conventional voltmeter, the digital voltmeter, the oscilloscope, and the mechanical printer with its reams of machine-oriented data have been replaced with a real-time multi-color display. The instant arrangement yields a simultaneous display of significant data from tens, hundreds, or thousands of test points. The data presented is up-dated 60 times each second, the data is quantized so that crisp changes in the display are made whenever test signals change their quantum levels. This new test system thus can provide detailed status displays needed for maintenance purposes. At the same time, it may provide a central display for making the operational decisions that depend upon equipment availability and equipment performance. These decisions be they maintenance or operational are made by humans; and the information on which these decisions are made is displayed in the foregoing arrangements in a format well suited to human comprehension.

Programmer

Division Headquarters of midwest multi-plant operation offers a challenging opportunity to a programmer with 2–5 years experience. Must be familiar with BAL, COBOL, or FORTRAN. Math background desirable.

In addition to excellent working conditions, we offer education assistance, non-contributory retirement plan, major medical insurance program and stock purchase plan. For interview, send resume in confidence to:

An Equal Opportunity Employer M/F
We need the best problem-solvers in the business to work on the best variety of programs in the business.

At McDonnell Douglas, you’ll have an opportunity to solve problems in fields ranging from real estate to nuclear propulsion, from hospital management to space logistics, from retailing to construction, from advanced aircraft to marketing research.

Our data facilities comprise several of the country’s largest, most modern computer systems. They serve our own exciting business and scientific programs in aircraft and astronautics, as well as commercial Datadrome customers throughout business, industry, science, government and education.

To keep pace with our expanding activities, we need more top people: scientific programmers, math modelers, digital computer analysts, business programmers, systems analysts, consultants, marketing representatives and sales engineers.

If multi-project problem-solving is the kind of challenge you’re looking for, just send the coupon, with your resume if available.

We have openings in St. Louis, Southern California, Washington, D.C., and New York.

Mail to: Mr. W. R. Wardle, Professional Employment, Box 14308, St. Louis, Mo., 63178
or: Mr. P. I. Kilgore, Professional Employment, 3000 Ocean Park Blvd., Santa Monica, Calif. 90406

TERP
(Continued from page 14)
simulated error, the supervisor performs one of the following actions. It cancels the ERP test case, retries the error condition, takes an equipment error exit, takes an operator intervention exit, returns control to the ERP test case, or puts the system into a hard wait state.

2. TERP Machine Check and Channel Inboard Error Simulation Logic

TERP machine check and channel inboard error simulation is accomplished through execution of the code generated by the MCINT macro. Machine check and channel inboard error simulation is supported for CPU Models 30, 40, and 50. Errors which can be simulated include CPU machine check, channel control check (CCC), channel data check (CDC), and interface control check (ICC). Error status is provided in the CPU

Placement of Computer Professionals since BINAC.

Software Age
If CPU machine check simulation is requested, an exit is directly made to the supervisor machine check handling routine by loading the machine check new PCW. If CCC, CDC, or ICC error simulation is specified, and the error is to be received by the specific CPU model via a machine check interrupt, an exit is also made to the supervisor machine check new PSW. If time by loading the machine check new PSW. If CCC, CDC, or ICC error simulation is requested and the error is to be received by the specific model CPU via an I/O interrupt, an I/O subroutine is executed which causes the I/O interrupt. Linkage with the TERP monitor causes CSW error simulation after this interrupt occurs. The monitor then gives control to the supervisor I/O interrupt handling routine which detects CCC, CDC, or ICC error status in the CSW and gives control to the supervisor machine check handling routine.

SYSTEMS ANALYSTS AND PROGRAMMERS

Have you investigated the challenge and financial rewards of association with the Computer Services Division of CDI?

Our Computer applications organization provides both business and scientific data processing services at every level. Opportunities are nationwide and offer extremely attractive compensation.

We invite your resume

programmer analysts

join
the
computer
tape parade!

... with all the other experienced, professional computer specialists who are in search of a complete, 100% data processing oriented firm. Our firm is just that... our people work on applications involving various systems which support the only nationwide stock brokerage computer service and one of the largest commercial installations in the country.

Midwest Stock Exchange Service Corporation can offer you varied programming assignments, sophisticated programming and systems design work that will include on-line and off-line systems in a multi-programming environment. You will have a chance to profitably expand your present knowledge, working with other professionals concerned only with the challenge of the computer.

We need programmer analysts with a minimum of two years' experience with large scale 360 systems, including a thorough knowledge of B.A.L. and D.O.S. Auxiliary experience on 7010 would be helpful.

Your move now to join the parade of professional, computer oriented people moving to M.S.E.S.C. will bring you excellent working conditions and fringe benefits, plus a salary based on your past experience and performance. If you are qualified, send your resume, including salary history, in confidence to: Miss T. Tompis

Midwest Stock Exchange Service Corporation

an equal opportunity employer

DECEMBER, 1968
you're a programmer... or a systems analyst

at pratt & whitney aircraft
YOU COULD BE BOTH

Now you can realize the best of both careers as a Systems-Programming Analyst in Business Information Systems at P&WA, world's leading producer of dependable jet engines. Here you will find boundless potential to develop into a real switch-hitting, broad-based talent.

The opportunities are manifold. Ours is one of the most advanced and sophisticated business information computer complexes in the country today. We have come as far as any. We will go further than most. Much of what you read about today as news in the industry, we have long since achieved.

At P&WA our Systems-Programming Analysts are exposed to virtually every phase of the business. A multiplicity of projects vary from simple card systems to complex on-line systems involving such projects as a Full Production Information System, Automated Financial Analysis and Reporting, and an Integrated Material Control System, including procurement, forecasting and scheduling. Tools include 360 models 20, 30, 40, and 50; tapes and random devices; data collection equipment; on-line facilities; DOS and OS.

Attractive openings exist at all levels for EDP professionals with up to five years experience. Preference will be given to applicants with recent experience using COBOL.

If this sounds like your kind of action, why not send your resume to Mr. H. M. Heidmann, Professional Placement, Office A-43, Pratt & Whitney Aircraft, East Hartford, Connecticut 06108. An equal opportunity employer.

Mr. Greene's article will be concluded in the January issue of software age
NEW PRODUCTS
(Continued from page 6)

A colorful, four page brochure from Liskey Aluminum, Inc., features Liskey-Aire environmental control systems for computer rooms, which are engineered exclusively for precision control of temperature, humidity, and air cleanliness in data processing centers.

The brochure illustrates the aesthetic quality of the modular units which are available in a choice of blue, red, gray, or custom color finishes to blend perfectly with other equipment.

The brochure also takes the aesthetic outside panels off the Liskey-Aire and lets the reader see the inner workings of the unit. Enlarged photographs of various sections offer visual details of how Liskey-Aire provides filtered and tempered air to men and machines. Easy access features for maintenance, via hinged front service doors and removable side and back panels, are also described.

For more information, circle No. 54 on the Reader Service Card

Access Corporation has announced the System 60, a new, high-speed, low-cost method of records automation and information control. Based on a random storage principle, it is designed to fill the gap between manual filing and the computer.

The System 60 automatically selects any desired document, or group of documents, from a file of many thousands in less time than dialing a telephone. Refiling in the conventional sense is eliminated because records can be replaced anywhere without regard to alphabetic or numeric sequence. This random return feature also prevents misfiling.

Access cards for the System 60 are available in both tabulating and 8" x 5" ledger formats. They can be custom imprinted with any desired form for manual or machine posting.

For more information, circle No. 55 on the Reader Service Card

The Programming Devices Division of Sealectro Corporation has developed a new Slide 'n Switch system which provides illuminated digital data display at both local and remote locations. Random access indication of digits 0-9 can be provided for any practical number of "stacked" Slide 'n Switch units such as the three-switch assembly shown in the photo above.

With the system shown, numerical readout can be provided away from the switches at some remote point or remotely and at the switching position as well. Applications include warehousing, trucking or in any area where this type of system is desirable.

For more information, circle No. 56 on the Reader Service Card

Photo Magnetic Systems' revolutionary telephone computational time sharing system—Comput-A-Phone—combines the use of the Touch-Tone telephone system, or standard rotary phones equipped with auxiliary dialers, with any automatic data processing machine anywhere.

For more information, circle No. 57 on the Reader Service Card

Several unusually fine opportunities now exist for experienced scientific programmers to work on non-military projects in our expanding digital computer applications group.

Responsibilities will include analyzing customer specifications, assisting in proposal writing, participating in hardware and software cost estimates, as well as creating program logic and debugging Real-Time, On-Line assembly language programs.

All candidates should have 3-5 years programming experience and have written programs in assembly language, in addition to Real-Time, On-Line experience. Background in Real-Time Monitors would be helpful.

Any familiarity with the following hardware would be appropriate: GE 4020; DDP 116, 124, 516; IBM 1800; SEL 810; Sigma II.

Salaries open, based on experience and ability. Comprehensive employee benefits. Company relocation assistance.

G. E. Meanor, Dept. 1118-SA
WESTINGHOUSE AIR BRAKE COMPANY
SWISSVALE POST OFFICE
PITTSBURGH, PA. 15218

DECEMBER, 1968
A new company, Techniprose, Inc., claims it has developed a way to make technical and scientific writing as easy as one, two, three, four. The company bases its new system on lists or tables of phrases as shown on the accompanying writing kit. Techniprose claims that the kit can be used to write thousands of "perfectly balanced, grammatically correct sentences, studded with the 'in-words' of your technology."

Naturally, some reservations have been expressed about the new writing system, called Simplified Integrated Modular Prose (SIMP). An interview was arranged with Dr. Ira Verbalmonger, president of Techniprose, to clear up the situation.

Q. Dr. Verbalmonger, I'd like to get right to the point. Do you expect us to believe that anyone can sensibly convey information just by pulling numbers out of the air?

A. Of course not! You miss the point. Our writing system is not designed to convey information. That's the last thing we want it to do. It is designed to fill up pages quickly, easily, and cheaply. It looks good, sounds authoritative, reads sonorously, but it doesn't say anything.

Q. Well, if you admit your writing system says nothing, whom do you expect to sell it to?

A. Of course not! You miss the point. Our writing system is not designed to convey information. That's the last thing we want it to do. It is designed to fill up pages quickly, easily, and cheaply. It looks good, sounds authoritative, reads sonorously, but it doesn't say anything.

Q. I see. How did you develop your SIMP method?

A. Actually, I got the idea from a "buzz sheet" of "in-words" from the aerospace industry. It was only a three-digit system as opposed to Techniprose's multi-digit system and it had a limited capability, possessing only the potential to formulate three-word phrases, such as "integral system parameters." Moreover, the system was obviously devised and implemented for the express purpose and concept of elevating to a plateau of ridicule the . . .

Q. Excuse me, Doctor, but you're losing me.

A. My apologies. I'm so involved in writing SIMP language that I sometimes lapse into it when I'm talking. What I meant to say was that the buzz list was dreamed up by some smart aleck as a joke, but I saw the real potential of the thing and took it over from there.

To understand the development of Simplified Integrated Modular Prose, I recruited, at no little expense, an outstanding team of specialists—nominativists, verbologists, adjectivists, and connectivists, supported by digitists. We began with...
an exhaustive search of the literature, and found a direct relationship between certain prose units and...

Q. Prose units?

A. Yes, a prose unit is what you laymen would call a word.

Q. Well, "word" is a good word. Why call it a prose unit?

A. We felt that prose unit was a more descriptive term, and it interfaces more harmoniously with prose groups, or sentences. Besides, when you're breaking ground in a new technology, you're entitled to your own set of in-words. Anyway, we found a direct relationship between a haziness of meaning and certain prose units, especially those that were polysyllabic and that emanated from Latin roots. Our studies also showed that haziness could be enhanced by selecting the prose unit that was most remote from the item it identified. For example, we always use 'system' for 'aircraft' and 'organism' for 'girl.'

From this basic research we were able to postulate a hazio/remotic scale of from one to ten to rate prose units. On this scale "girl" ranked 1 and parameter ranked 10. We applied this scale to aerospace industry words and accepted for SIMP only the prose units that rated 7 or more.

At the same time we had a separate group of sentence structural engineers performing destructive testing on prose groups (sentences to you.) This group postulated a ratio which served as a foundation for all subsequent sentence design efforts, namely

L/D $\rightarrow 0.9$. Solve for least value.

Q. Just a minute! L/D stands for lift over drag and if lift is not more than drag, the airplane won't get off the ground.

A. Precisely. In this case, L stands for literacy and D stands for drive, but the same principle applies. We guarantee, absolutely, that none of our sentences will ever get off the ground.

Q. Doctor, would you like to tell us a little about your plans for the future?

A. We see an unlimited future to SIMP writing. Right now we're drawing up customized SIMP kits for other disciplines, such as chemistry, physics, economics and sociology. Incidentally, we're really having a ball with sociology.

Q. Just what are your sales figures and potential?

A. Our sales figures are confidential, but I can tell you that SIMP writing is catching on like mad. If you look for it, you can find examples of SIMP writing almost everywhere.

Q. Thank you Dr. Verbalmonger. Just one more question: What was your pre-SIMP line of work?

A. Prior to becoming deeply committed, both financially and time-wise, in my present area of endeavor, various types of paramedical nostrums were devised, formulated, tested, produced and marketed through my efforts, enabling me to maintain a socio-economic level that was compatible with, but not in excess of, that which one might....
LOCKED IN—
TO DULL PROGRAMMING?

Exciting jobs and better pay in Programming are all around you these days. PARKER-FINCH can help you find the work you want to do—spring you loose from monotonous routine and dead-end work. To have us open new doors to your future, simply send us your resume or call us today. Key jobs are waiting!

SPEED
HExadecimal
TRAINING

Get programmers productive sooner with hexadecimal programming tools

HEXAFTER-360
Relates hexadecimal byte values to operation codes, EBCDIC characters and decimal equivalents. Converts directly up to 4095 (FFF), larger values in two steps.

HEX-DEC ADDER
Adds/subtracts either two hexadecimal numbers or a decimal-hexadecimal pair giving a hexadecimal result. Hexadecimal addresses resulting from multiple decimal offsets can be read with a single setting.

HEXADUMP OVERLAYS
Allow the novice to locate data on dumps quickly and show how hexadecimal addresses are related to decimal offsets.

The trainee can handle hexadecimal like an old pro with these aids, all at a cost of less than a day's pay.

Write for a free brochure

As will be obvious, the tables and methodology presented here have been grossly simplified to explain the workings of the system. As offered by Techniprose, Inc., the system is much more elaborate. A variety of software packages for various computers are offered by the firm. These range from four or six 50-phrase tables (recommended for second-generation equipment or the smaller third-generation machines using disc storage) to programs run able only on the most sophisticated hardware presently available.

The most advanced program, for machines with core storage in excess of 560K, is the 64/200 (LG). By the designation system adopted by Techniprose, this indicates 64 tables of 200 phrases each—including one table of obscure references and one of irrelevant footnotes. The parenthetical LG denotes that any phrase may be presented in Latin or Greek at will, the translation being triggered by a 12-9-7-4 punch in cc-80 (or 12-7-9-3 for Greek.) Tables of untried formulae and of random punctuation are also included.

This program, with the tables in direct-access storage, is run against the commercially available tape of "a million random numbers.

This particular package is still somewhat experimental, Dr. Verbalmonger reported; but it looks extremely promising in view of the fact that three of the first four papers produced in trial runs are currently being considered for Nobel prizes. One is in the running for the prize in biology, one for physics and the third is being considered both for the chemistry award and the literature award—this despite the fact that all were run using the tables of aerodynamic phrases.

NAME: ____________________________

ADDRESS: ____________________________

CITY: ___________ STATE: ___________ ZIP: ___________

Signature: ____________________________

WORD COUNT: Include name and address. Name of city (Des Moines) or of state (New York) counts as one word each. Zone or Zip Code numbers not counted. (Publisher reserves right to omit Zip Code if space does not permit.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as 85mm, COD, PO, AC, etc., count as one word. Hyphenated words count as two words.

SA-12

DECEMBER, 1968
There's a certain kind of man (and woman of course) who anticipates opportunity. He's alert to new situations. He's thoughtful . . . aggressive. And when opportunity hits, he's ready to move. That's the kind of candidate we're looking for right now.

ITT Data Services has opened the gates to a new dimension in data processing—the Data Dimension. It's the latest in conversational time-sharing and the most up-to-date applications programming services.

What it means to the lay businessman is the most advanced time-sharing service he can buy—using all System/360 computers . . . and possibly the most advanced, comprehensive software anywhere.

To the financial community, it's also something special. With on-line credit information in seconds, advanced management information and accounting systems . . . and more.

What it means to us is growth. The kind that requires 20 new operational centers throughout the U.S. by 1970. And, not incidentally, a lot of new talent. Right now, we need many different skills in the Data Dimension, including:

**SR. MARKETING REPRESENTATIVES** for our real-time credit information system. Openings exist in many major cities.

**SALES REPRESENTATIVES** (Experienced and Trainees) for programming services and time-sharing, based in several important markets.

**TECHNICAL SUPPORT/SYSTEMS REPRESENTATIVES** for Reactive Terminal Service (RTS*), time-sharing, credit information retrieval systems.

**PROGRAMMER/ANALYSTS** with IBM 360 experience in BAL, RPG, COBOL, PL/1 and real-time applications. Openings in metropolitan New York, Los Angeles and Houston.

**DATA PROCESSING INSTRUCTORS** in the areas of systems, FORTRAN and COBOL. Based at our Paramus, N.J. headquarters.

**SYSTEMS MANAGER** for RTS and time-sharing applications . . . also based in Paramus.

If you'd like to program your time to handle an enormous variety of challenges each day—and the opportunity to innovate in an expanding young company, you're our kind of people.

Direct your resume to either of these offices:

Mr. E. S. Galvin
ITT Data Services
Dept. EC 1500
Rte. 17 & Garden State Parkway
Paramus, New Jersey 07652

Mr. E. J. Stiles
ITT Data Services
Dept. WC 1500
999 No. Sepulveda Blvd.
El Segundo, California 90245

* A service mark of ITT Data Services, A Division of International Telephone and Telegraph Corporation
CONFIDENTIAL INQUIRY

Your original copy of this form will be retained at the offices of SOFTWARE AGE and will be used for no other purpose than to notify the specific firms which you have checked (on the reverse side) of your interest.

TYPE OR PRINT CLEARLY FOR PHOTO REPRODUCTION

JOB DESIRED: _______________________________

List computer hardware knowledge (names of systems, tape, disk, terminals, etc.): _______________________________

Programming specialties and years of experience (commercial, scientific, theoretical, experimental, analog, etc.): _______________________________

Systems programming on which you have had development experience (compilers, assemblers, executives, monitors, O.S., etc. Indicate for what computer): _______________________________

Programming languages used and extent of experience (COBOL, FORTRAN, etc.): _______________________________

Applications programmed (aerospace, banking, insurance, math subroutines, compilers, etc.): _______________________________

Systems analysis experience (card design, flow charting, operation analysis, etc.): _______________________________

EDP management experience (include years and number of people reporting to you): _______________________________

SALARY: ____________________________ DATE OF AVAILABILITY: ____________________________

(current) (desired)

EDUCATION: Indicate major as well as degree unless self-explanatory.

Degrees ____________________________ Years ____________________________

Schools ____________________________

EMPLOYMENT: Indicate present employment and previous jobs below.

Employer ____________________________ City ____________________________

Years to ____________________________ to ____________________________ to ____________________________

Title or Function ____________________________

Name ____________________________ Age ____________________________

Home Address ____________________________ Home Phone ____________________________

(city) ____________________________ (state) ____________________________ (ZIP code) ____________________________

U.S. Citizen? ____________________________

Security Clearance ____________________________ Location Preference ____________________________

Marital Status ____________________________

Military Status ____________________________
